Two things follow and the Foundation separates them. The first is that the Department is not without a night driving glare test. It has used one. The second is that a vision research institute of Harvard Medical School, writing in a peer-reviewed conference proceedings, states that the test does not reproduce the light. The headlamps in it are part of a filmed scene, which is to say that the luminance reaching the subject is the luminance of a projected film and not of a headlamp. The authors add that even a realistic source in a clinical test would not show the functional consequences, because such tests cannot measure reaction to realistic objects, steering stability, or the head and eye movements by which a person turns away from a light.

Which products the Department applies that test to, and which it does not

The paper also records why such a test exists at all, and the answer is the most consequential sentence in it for this comment:

> Effects of variations in design are of interest to manufacturers of ophthalmic devices, as they are required to satisfy FDA safety concerns and also want to verify that their products are not worsening the night-driving situation.

The Department therefore asks a question about headlamp glare already, and asks it of contact lenses, intraocular lenses and the other ophthalmic devices within its device authority. A manufacturer who places a lens in front of a retina must satisfy the Department that the lens does not make night driving worse. The light that the lens is tested against comes from a headlamp, and the manufacturer of the headlamp is asked nothing at all.

The Foundation does not suggest that the device requirement is misplaced. It is plainly right that a lens be tested against the conditions in which it will be worn. The observation is about the asymmetry. In the only place where the Department presently engages with this exposure, it regulates the receiver and leaves the emitter alone, even though the emitter is an electronic product emitting electronic product radiation within section 360hh(1)(A) and the receiver is a person's eye. The quantity being controlled is the same quantity in both cases. Only the party bearing the obligation differs.

What the authors found the literature did not contain

Writing in 2009 they stated that "To our knowledge the behavioral effects of headlight glare have never directly been examined, and no measure of eye and head movement during driving glare was found in the literature", and that previous behavioral studies "have used inaccurate glare simulations". The Foundation has not established what has been published since and has not checked it.

One further finding reported in their review bears directly on a passage earlier in this Part. They record that Theeuwes and colleagues, in 2002, "made the interesting discovery that drivers' impression of a glare source does not relate well to their on-road performance", and that clinical glare measures correlate only weakly with driving performance and are not reliable predictors of it. Part VI.B.2 reports an American evaluation of adaptive driving beam systems whose glare finding rested entirely on subjective ratings given by five observers on a nine-point scale. On the evidence these authors summarize, a subjective rating is not a measure of what the light does to a person's performance, and the Foundation asks that the evaluation at Part VI.B.2 be read accordingly.

A corroboration the Foundation records because it runs the other way from a source cited above

Part V.C.5 argues from optics that the light scattered within the eye, and therefore the veiling luminance that destroys contrast, is increased by changes in the ocular media. The European survey described earlier in this subsection found no age gradient in how often drivers report being dazzled, and the Foundation recorded that finding against its own position. These authors, at an eye research

institute, state the optical proposition directly: that changes in the ocular media brought about by age, by eye surgery, by cataract, or by the use of contact lenses, intraocular lenses and spectacles "can all worsen the 'veiling luminance' upon the retina responsible for disability glare". The two findings are about different things, one about reported annoyance and one about light scattered on a retina, and Part V.C.5 rests on the second.

The third instance of the liaison point in this subsection

Paragraph 360ii(a)(3) directs the Secretary to maintain liaison with and receive information from other agencies, professional organizations and others concerned with electronic product radiation. This subsection has now identified three capabilities that exist and one question that has not been put to any of them. A decade of headlamp photometry is held by the Insurance Institute for Highway Safety. An imaging photometer and a vehicle test facility are held by the National Highway Traffic Safety Administration. And an apparatus that presents calibrated headlamp glare to a driver while recording steering, reaction and gaze was built at a medical school in 2009, by investigators whose work the Department's own device program has reason to know.

What the Foundation asks on test procedure

That the Department state what test procedure it would use to evaluate the effect of vehicle forward lighting on a person, and if the answer is the night driving simulator its device program has used, that it state whether it accepts the criticism these authors make of it. Part II.H.3 establishes that paragraphs 360ii(a)(2) and (a)(5) direct the antecedent work of defining the quantity to be minimized and developing measurement methods referred to the point of human exposure. A performance standard that cannot be tested is not a standard, and the test procedure is therefore not a detail to be settled afterwards but part of what the statute directs the Secretary to develop. The Foundation observes that the Department has had, since 2009, a published description of an apparatus that does what such a test procedure would require, and that it was built three miles from a Department field office by investigators who were building it in order to satisfy the Department.

What the agency was told in 2008, and by whom

Everything above concerns the present. There is also a history, it is documented, and it is short enough to set out. It begins with the public, passes through Congress, and ends without a standard.

In 2001 the National Highway Traffic Safety Administration opened a public docket inviting comment on headlamp glare. The agency's own account of what arrived is one sentence: "Most responses received have been complaints." In 2005 Congress acted. Section 2015 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act directed the Department of Transportation to conduct a study on:

> "the risks associated with glare to oncoming drivers, including increased risks to drivers on 2-lane highways, increased risks to drivers over the age of 50, and the overall effects of glare on driver performance", together with "any recommendations regarding measures to reduce the risks associated with glare to oncoming drivers."

The research was performed by the Lighting Research Center at Rensselaer Polytechnic Institute under contract to the agency and reported in Bullough J. D., Skinner N. P., Pysar R. M., Radetsky L. C., Smith A. M. and Rea M. S., Nighttime Glare and Driving Performance: Research Findings, Report No. DOT HS 811 043, September 2008, described at Appendix C.107. It is 118 pages and comprises seven studies. The lead author is the same investigator whose later work on emergency warning lamps appears at Part VI.C.1 and Appendix D.4.

The eight countermeasures, and how the agency's contractor rated them

The report assessed the countermeasures that the agency had set out in its 2007 report to Congress and rated each as having high, medium or low potential. Mounting height, optical design and low beam distribution were rated low. Cleaning and maintenance was rated medium. Two were rated high and one of the mediums is the one this comment has been looking for.

On aim, rated high:

> "It appears that some new vehicles and many in-use vehicles have mis-aimed headlamps that compromise visibility (when mis-aimed downward) and increase glare to other drivers (when mis-aimed upward). Periodic adjustment of aim should result in more consistent visual conditions."

The Foundation sets that beside the finding recorded earlier in this subsection and asks the Department to read the two dates. In 2008 the agency's contractor identified aim as one of the two highest-value countermeasures available and reported that mis-aimed headlamps were prevalent on new and in-use vehicles alike. In October 2023 the agency's own Vehicle Research and Test Center reported that there are no requirements in Standard No. 108 for aiming headlamps on a vehicle, and found that a majority of the new vehicles it measured were delivered aimed above the manufacturer's own target. Fifteen years separate those two documents and both are the agency's. The Foundation states the chronology and offers no characterization of it.

On color, rated medium:

> "'Bluer' sources such as HID headlamps do indeed increase discomfort, so restricting short-wavelength output could reduce discomfort, but would likely have little impact on visibility reductions from headlamps."

That is a federal contractor, reporting to the agency that regulates these lamps, under a study Congress directed, recommending that restricting short-wavelength output be considered. It is the proposition this comment puts at Part V.B.3 and Part V.F, stated in 2008, in a document the agency commissioned and published. No such restriction exists in Standard No. 108 today, and the agency wrote to the Foundation on 13 February 2024 that the standard does not directly regulate the spectral power distribution of the headlamp light source.

The fleet the study measured, which no longer exists

The recommendation on color was made about high-intensity discharge lamps, because those were the bluer sources then on the road. The Foundation has examined the report for its treatment of the technology that has since replaced them, and the result is the reason this document is in the comment.

In 118 pages, light-emitting diodes are mentioned twice. Neither mention is a measurement. Both are speculations about how the adaptive prototype the program developed might one day be built: that reduction of intensity "could be carried out through a modular approach of smaller sources (e.g., possibly light emitting diodes)", and that "light emitting diodes (LEDs) could be a useful light source technology for dynamically switching or dimming parts of a beam pattern". No diode headlamp was measured. No diode spectrum was assessed. No exposure from a diode source was evaluated, because in 2008 there was substantially none to evaluate.

The study's own exposure data confirm the composition of the fleet it observed. The authors record that in the field work "the presence of high-intensity discharge headlamps during the study was very rare and that almost all oncoming headlamps experienced by the subjects were halogen headlamps", and they state that this limits what can be concluded from their spectral measurements.

So the position is this. The last congressionally directed federal study of headlamp glare was completed in 2008. It was conducted on a fleet that was almost entirely halogen. Its spectral recommendation concerned a discharge source that has since been displaced. Part VI.B.1 has established that the luminous intensity of low beams rose by about thirty-five percent in the decade to 2025 and that fourteen of the fifteen new vehicles a federal laboratory bought in 2022 and 2023 carried diode headlamps. No equivalent federal study has been conducted on the fleet that now exists.

The instrument the agency already had, in 2008

The field study measured light at the driver's eye with a head-worn meter developed by the Lighting Research Center, the Daysimeter. The report records that "The head-worn device included a photopic illuminance detector and a short-wavelength ('blue') detector", and that the combination "allowed differentiation among light sources of differing spectral composition".

That is the fourth capability this subsection has identified and the most directly on point of the four. In 2008, under federal contract, a wearable instrument measured short-wavelength light arriving at the eyes of drivers on public roads. The quantity it measured is the quantity this comment asks the Department to evaluate. It was measured in order to distinguish halogen from discharge sources, and the finding it supported was about discomfort ratings. Nobody has since pointed it at a diode fleet and asked a question about the eye.

Three findings the Foundation records because they bear elsewhere in this comment

The first concerns age, and it is the agency's answer to the question Congress asked about drivers over fifty: "Glare reduces visibility more for older (>50 years) drivers because the eyes of older drivers contain more dead cells that increase the amount of scattered light compared to younger drivers, resulting in a brighter 'veil' over the scene." The report states separately that "Older drivers are more susceptible to headlamp glare in terms of disability glare and glare recovery." That is a federal finding supporting Part V.C.5, and the Foundation sets it beside the European survey recorded earlier in this subsection, which found no age gradient in how often drivers report being dazzled. The two are not in conflict. One measures scattered light on a retina and the other measures how often people complain.

The second concerns the difference between what people report and what happens to their vision: "Drivers' perceptions of glare (i.e., discomfort glare) are often different from the other negative effects of glare (i.e., disability glare and glare recovery), probably explaining in part the negative responses to 'blue' HID headlamps (because they elicit greater discomfort even when they do not diminish visibility more than halogen headlamps [i.e., at the same luminous intensity])." This is now the third independent source in this comment for the proposition that a subjective glare rating is not a measure of visual performance, and it is a federal one. It bears on Part VI.B.2, where the only American evaluation of adaptive driving beam rested on subjective ratings from five observers.

The third concerns the adequacy of the lower beam itself: "Present low beam headlamp patterns do not appear to provide sufficient visibility at many of the higher driving speeds for which they are commonly used, even when no oncoming vehicle headlamps are present." The Foundation records that because it is the tension running through this entire subsection, stated by the agency's own contractor: the beam is simultaneously too weak for the driver who uses it and too strong for the person who meets it, and no standard reconciles those two facts because no standard measures the second.

A finding that runs against a source cited earlier in this subsection

The European submission described above asserts that "US research shows that there is a link between glare from lights and road accidents", naming no study. The Foundation declined to adopt that assertion when it recorded the submission, and records here what the American research actually says. This report states: "Despite the very clear evidence relating glare to reduced visibility, there is little direct evidence linking glare to increased crash risk." It explains why, which is that unlike alcohol there is usually no way to determine whether glare contributed to a particular crash, and it adds that police reports sometimes mention glare and that an effect is not unreasonable to expect. The Foundation adopts the agency's formulation and not the submission's.

What this establishes, and what it does not

It does not establish that the agency did nothing. It conducted the study Congress directed, published it, measured aim and eye illuminance in the field, and built and demonstrated a prototype

adaptive system that anticipated by fourteen years the technology at Part VI.B.2. The Foundation records that work rather than passing over it.

What it establishes is the shape of the gap. The agency studied glare as a problem of visibility, comfort and crash risk, which is its mandate and the mandate Congress gave it. Within that study its contractor reported that bluer sources increase discomfort and that restricting short-wavelength output could reduce it. What was never asked, because it is not that agency's question to ask, is what short-wavelength optical radiation at those levels does to the tissue of the eye receiving it. That question belongs to the Department, the instrument to measure its input existed under federal contract in 2008, and the fleet has been replaced in the interval by sources with different spectral properties without the question being put at all.

The ophthalmological account, including the part of it that corrects the Foundation

The sources above are engineering, regulatory and survey documents. The Foundation closes this subsection with one written by ophthalmologists, because it answers the question the others leave open — what is actually happening in the eye — and because it contradicts a proposition the Foundation might have been expected to advance.

Mainster M. A. and Timberlake G. T., Why HID headlights bother older drivers, British Journal of Ophthalmology, 2002, described at Appendix C.108. The authors write from the Department of Ophthalmology at the University of Kansas, and the article is a perspective rather than a report of original experiment. It reviews the optics of headlamps, the physics of light scattering in the eye, and the clinical literature on glare and photostress, in order to explain why complaints about high-intensity discharge headlamps came predominantly from older drivers.

The correction

Their conclusion is stated in the abstract and the Foundation reproduces it without softening:

> "An analysis of automobile headlights, intraocular stray light, glare, and night driving shows that brightness rather than blueness is the primary reason for the visual problems that HID headlights can cause for older drivers who confront them."

The reasoning is optical. Light scattered by small particles is wavelength dependent and light scattered by large ones is not, and in the eye the two effects run in opposite directions: scatter from the cornea and lens falls with increasing wavelength, while scatter from fundus reflectance and transillumination rises with it. The authors state the result: "The net effect is that stray light reaching the fovea has little wavelength dependence. Thus, blue-white HID headlights should produce no more foveal stray light or disability glare than white headlights of the same luminance."

The Foundation records that finding as the authors state it and does not argue with it. No part of this comment contends that the short-wavelength content of a headlamp increases disability glare, and if any passage elsewhere could be read that way it should be corrected against this source. The quantity that governs disability glare is luminance, which is the quantity Part VI.B.1 has shown the federal standard does not regulate and which the European submission asked the international regulator to limit.

What the same authors say blueness does do

The correction is confined to disability glare, and the authors are equally clear about the other kind: "HID headlights also cause more discomfort glare than conventional halogen headlights of the same photopic or scotopic illuminance. This potential distraction is greater in 61–77 than 20–31 year old drivers."

That is a spectral effect at matched illuminance, which is to say an effect of the light's composition rather than its quantity, and it is larger in older people. It is the same finding the National Highway Traffic Safety Administration received from its own contractor six years later, recorded earlier in this subsection: that bluer sources do increase discomfort while having little effect on visibility. Two

independent sources in this comment, one clinical and one federal, reach the same split conclusion. The Foundation adopts it, and states the consequence: the case for attending to spectral content rests on discomfort, distraction and aversion, and separately on the photochemical questions treated at Part V.B.2 and Part V.B.3, which concern injury to tissue and not the scattering of light within the eye. It does not rest on disability glare.

The authors describe what discomfort glare consists of, and the list is the reason this comment treats it as more than annoyance: it "does not impair vision, but it can be startling or distracting to a driver, and cause blinking, squinting, ocular aversion, and fatigue". They add that "The physiological and psychophysical origins of discomfort glare remain uncertain." An effect whose mechanism is unknown, which produces aversion and fatigue in drivers, and which is worse in older people, is a biological question about a radiation-emitting product.

Photostress, which outlasts the exposure

The article supplies a third category this comment has not until now named. Beyond veiling and dazzle glare, which are optical and end when the light does, the authors describe scotomatic glare, which does not:

> "Scotomatic disability glare occurs when a brilliant light source decreases visual sensitivity ('puts a retinal area temporarily out of business'). Sensitivity is diminished while the visual system rapidly light adapts during glare exposure and then more slowly dark adapts after glare exposure. This 'photostress' may startle and disorient observers, producing afterimages that interfere with vision."

Its mechanism is stated: it "is caused primarily by rapid bleaching and subsequent slower regeneration of retinal photoreceptor photopigments". Its magnitude scales with the source: "Photostress recovery time increases with photostress source luminance", and "It also increases with ageing". The authors note that photostress "occurs during flash photography and momentary exposure to an inept lecturer's laser pointer beam".

Part V.E.7 concerns effects of light that outlast the exposure that produced them, and rests on a laboratory study in mice. Here is the clinically established human instance of the same class, named in the ophthalmological literature, scaling with source luminance, worsening with age, and occurring routinely on public roads. The Foundation asks that Part V.E.7 be read with it, and notes that the European survey reported earlier in this subsection found thirty percent of a representative sample reporting that they continued to see an image of the light source after passing it, or felt pain. That is photostress, reported by the people experiencing it.

Three findings about measurement and about age

First, on age, which bears on Part V.C.5 and on the European survey finding recorded against the Foundation earlier in this subsection: "Light scattering increases in people over 50 years of age"; "Older individuals have increased intraocular stray light, glare sensitivity, and photostress recovery time"; and disability glare is increased by cataract, by intraocular lens implantation and by posterior capsule opacification. This is the third source in this subsection stating the optical proposition, after the Harvard apparatus paper and the federal study of 2008.

Second, on the difference between a laboratory and a road: "Transient glare as occurs in a headlight encounter is worse than static glare from a light source of the same luminance, and this effect increases with ageing and media opacities." And in the conclusion: "Conventional clinical glare tests underestimate disability glare from moving light sources." Every photometric requirement described in this subsection is a static measurement. The authors state that static measurement understates what a moving source does, and that the understatement grows with the age of the person exposed.

Third, on a mechanism this comment asserted earlier and could not source. Part VI.B.1 records, in treating a study of headlamp spectra under fog, that scattering by fog droplets is weakly dependent

on wavelength and that this is why fog appears grey. These authors state it: “Large particle or Mie scattering is not wavelength dependent, but light is preferentially scattered in the forward direction”, and “Fog doesn’t change the apparent colour of automobile headlights because large fog droplets scatter all visible wavelengths equally effectively.”

What the authors say about regulation, in 2002

Two sentences, written twenty-four years ago. On the state of the remedies: “Practical solutions for the highway glare problem have been studied for decades. Countermeasures have never been implemented seriously because of consumer disinterest, manufacturer resistance, and lack of legislative resolve.” And on who decides: “Governmental regulations determine which headlights we encounter.”

The Foundation offers no gloss on either. It observes only that the article was published in 2002, that the countermeasures it describes include adaptive beam systems which were not lawful in the United States until a rulemaking more than nineteen years later, and that the discharge lamps it was written about have since been replaced by a source its authors did not discuss.

What this article does not establish, and what the comment does not take from it

It is a perspective article and reports no original experiment, no measurement of any lamp and no study of any population. Every quantitative claim in it is drawn from the literature it reviews. It predates light-emitting diode headlamps entirely and says nothing about them; the sources it compares are tungsten, tungsten-halogen and xenon discharge, and it gives their correlated color temperatures as approximately 2800, 3200 and 4200 kelvin against about 5600 for the midday sun, observing that discharge lamps are “not as blue as ordinary sunlight, but they are brighter and bluer than conventional halogen bulbs”. The Foundation does not extrapolate from those figures to any diode product, and nothing in this article supports a conclusion about one.

Nor does it address injury. Its subject is the scattering of light within the eye and the bleaching of photopigment, both of which are reversible optical and photochemical processes of normal vision. It makes no claim about damage to tissue, and the propositions at Part V.B.2 and Part V.B.3 rest on other sources entirely.

The measurement that puts numbers on it

The account above is clinical and describes mechanisms. One American study measured the magnitude, in the units in which the eye works, and the Foundation closes the subsection with it because of what its figures show and when they were obtained.

Olson P. L. and Aoki T., The Measurement of Dark Adaptation Level in the Presence of Glare, Report No. UMTRI-89-34, University of Michigan Transportation Research Institute, November 1989, described at Appendix C.109. The Foundation states the sponsorship before the findings. The work was carried out under the University of Michigan Industry Affiliation Program for Human Factors in Transportation Safety, whose members at the date of the report are listed in it as GE Lighting, GTE Products Corporation, Ichikoh Industries, the Inland and Fisher Guide Divisions of General Motors, Koito Manufacturing, Stanley Electric and Valeo Automotive. It is lamp and vehicle lighting industry funded research, and the last of those companies to be named and the fifth are manufacturers whose correspondence the National Highway Traffic Safety Administration has relied on in its own interpretations.

What was measured

The quantity is the adaptation level of the driver’s eye, which is not a property of the lamp but of the person. It was obtained indirectly. Subjects were exposed to glare, the glare was extinguished, and the time until they could detect a target light source was recorded. That time was then read against a curve established in the laboratory, where subjects were adapted to surfaces of known luminance and the same recovery was timed. The field test was conducted facing standard United States low and high beams at about 150 feet.

The measured recoveries were a mean of 3.63 seconds after low beam glare, with a standard deviation of 0.59, across fifteen subjects, and 5.14 seconds after high beam glare, standard deviation 0.94, across fourteen. Read against the laboratory curve those correspond, in the authors' words, to adaptation levels of "about 5 and 20 ft-L". The Foundation notes the inference and states it as a limitation: the adaptation levels were not measured directly but derived from recovery times through a calibration.

The size of the shift

The value of the study is that it places the driver on a scale alongside everyone else on the road. Taking the companion figures the authors report from their earlier work at the same site, the adaptation levels are:

a pedestrian standing on the unlit road, about 0.005 foot-lamberts;

a driver on that road with low beams of their own, about 0.3;

the same driver on high beams, about 1.7;

a driver on low beams meeting another car on low beams, about 5;

the same encounter where the oncoming car is on high beams, about 20.

The authors state the span: meeting another car on low beams raises the driver to a level "a full three log units above that of the pedestrian standing on an unlighted road", and if the oncoming car is on high beams the level "will increase fourfold" again.

The arithmetic that follows is the Foundation's. A foot-lambert is about 3.43 candelas per square meter, so the five levels are approximately 0.017, 1.0, 5.8, 17 and 69 candelas per square meter. Meeting an oncoming low beam raises the driver's adaptation level to roughly seventeen times what their own low beams produce. Meeting an oncoming high beam raises it to roughly sixty-seven times their own low beams, and to about four thousand times the level of the pedestrian they are trying to see.

The authors add the observation that matters most for what the eye is then doing. Of the two glare-condition levels they write that "both of these levels are in the cone vision (photopic) zone". Night driving is a mesopic task. An oncoming headlamp pushes the driver out of mesopic vision into the regime the visual system uses in daylight, while the thing the driver must see remains an unlit road.

The recovery, and what it costs in distance

The authors convert their recovery times into the quantity that matters on a road:

> "recovery from high beam glare requires a little over five seconds, during which time the vehicle will travel almost 500 feet at 65 mph. Recovery from low beam glare is not much better. At 65 mph, the vehicle will travel about 350 feet before visual capability returns to maximum. When meeting a fairly steady flow of oncoming traffic, this means that a driver's vision is seldom as good as it could be in the absence of such traffic, due to a combination of disability glare and upward adjustments in dark adaptation."

The Foundation draws two things from that passage. The first is that the United States has a measured figure for glare recovery after a headlamp encounter, and it is this one. The European submission described earlier in this subsection relies instead on a figure of up to nine seconds attributed to a British road safety body, which the Foundation has recorded is the value for a sixty-five-year-old and which that submission used without the qualification. These measurements, of 3.63 and 5.14 seconds, are American, are from a vehicle research institute, and are reported with their standard deviations.

The second is the authors' conclusion, which is not about any single encounter. On a road carrying oncoming traffic, the driver is not impaired at intervals and restored between them. The driver is, in their words, seldom as good as they could be. The exposure is not the event. The exposure is the condition.

The pedestrian, again

One paragraph of the discussion bears directly on Part VI.B.2, where the Foundation records that the only American evaluation of adaptive driving beam took a vehicle as its observation point:

> "One of the interesting things is that the pedestrian, without special illumination, can see some things better than the driver can with the illumination of the vehicle's headlamps, simply because of the difference in adaptation level. This is not to suggest that headlights are more of a hindrance than a help, but undoubtedly some things out of the range of the headlamps can be seen by the pedestrian, but not the driver."

The pedestrian and the driver are at adaptation levels differing by three log units, and the Foundation observes that only one of them is inside the vehicle whose lamps determine both. The person outside the car is the person this comment has had to keep returning to, and the measurement above is one of the few places in the American record where that person's visual state is given a number at all.

What it does not establish

It is thirty-seven years old. The beams it measured were standard United States sealed-beam and halogen systems of 1989, and the comparison between facing low and high beams is a comparison between two conditions of that fleet. Nothing in it bears on a light-emitting diode headlamp, and the Foundation makes no inference to one. Fifteen subjects were tested on low beam and fourteen on high, the report gives no breakdown by age, and the adaptation levels are inferred from recovery times rather than measured. It was funded by the lighting and vehicle industry. And it reports no health endpoint of any kind: its subject is visual performance, not injury.

The limitation that matters most is the first. Part VI.B.1 has established that the luminous intensity of low beams rose by about a third in the decade to 2025 and that the fleet is now substantially diode. The adaptation level a driver reaches when meeting a modern vehicle has not been measured by anyone, and the Foundation has been unable to find any American study since 1989 that has attempted it.

Why it belongs before the Department

Because paragraph 360ii(a)(4) directs the Secretary to study and evaluate emissions of, and conditions of exposure to, electronic product radiation, and this is a condition of exposure expressed in the quantity the exposed person actually experiences. It is not an emission figure, which every other federal document in this subsection reports. It is a measurement of the state the radiation puts a human visual system into, how far that is from the state the task requires, and how long it takes to come back. One such measurement exists. It was made in 1989, by a university institute, with money from the companies that make the lamps, on a technology that has since been replaced.

What the Foundation asks

That the Department treat the luminance, spectral content and direction of vehicle forward lighting as electronic product radiation within the meaning of section 360ii, and that it do the three things that paragraph directs: study and evaluate the emission and the conditions of exposure under paragraph (a)(4); maintain liaison under paragraph (a)(3) with the agency that regulates the lamps, which has twice written to the Foundation that the relevant expertise is here; and determine under section 360kk whether a performance standard is required. The Foundation notes that the three quantities such a standard would have to address — the luminance of the source, its short-wavelength content, and the direction in which the radiation is delivered under the conditions in which vehicles are actually driven — are the three that the agency administering Standard No. 108 has stated it does not directly regulate, and that two of them are what the European submission described above asked the international regulator to limit. This is the clearest case in the comment for joint work rather than referral, because neither agency can reach it alone. The National Highway Traffic Safety Administration holds the vehicle, the standard, the test facility and the instrument. This Department holds the mandate to ask what the radiation does to the person who receives it.

The statute contemplates exactly that division, and paragraph 360ii(a)(3) is the provision that joins it.

2. Adaptive driving beam systems

What the product is

An adaptive driving beam system is an upper beam headlamp that does not switch off. It remains in upper beam operation continuously above a set speed, and instead of dipping when it meets another vehicle it subtracts a portion of its own beam, holding a moving shadow over the vehicle it has detected while the remainder of the pattern stays at upper beam intensity. The shadow tracks the other vehicle as the two approach and pass.

The Foundation puts this product class in a subsection of its own, rather than within the treatment of headlamps, for two reasons. The first is that its defining feature is not the quantity of its emission but the continuous reconfiguration of that emission in space, which is a condition of exposure unlike any other in this Part. The second is that the agency that regulates it has written into its own definition of it three criteria about what happens to the people it shines on, and has no means of evaluating two of them.

The definition, and the three criteria in it

The National Highway Traffic Safety Administration describes an adaptive driving beam as:

> "a type of adaptive front-lighting system that automatically enables upper beam headlamps and adapts their beam patterns to create a shaded area around oncoming and preceding vehicles to improve long-range visibility for the driver without causing discomfort, distraction, or glare to other road users."

The Foundation asks the Department to read the final clause. The performance the agency ascribes to this technology is defined by the absence of three things in other people: discomfort, distraction, and glare. Not one of the three is a photometric quantity. Discomfort and distraction are states of a person, and distraction in particular is a matter of attention rather than of vision. Glare, in the form in which it is customarily measured, is a subjective rating.

That is the position this comment has described throughout Part II.H. The agency has committed itself, in defining the product, to a proposition about what the radiation does to the human beings it reaches. It has no mandate to study that question, no research program directed to it, and no method in its standard for evaluating it. The expertise the agency itself has twice identified as residing in this Department is the expertise the agency's own definition presupposes.

What has been measured, including what runs against the Foundation's position

The principal American evaluation of these systems is Comparison of European and U.S. Specification Automotive Headlamp Performance, published by the American Automobile Association in April 2019 and described at Appendix C.104. Four vehicles were tested, two United States specification and two European, from two manufacturers, on a closed course. The Foundation reports its findings in full, including those that do not assist the Foundation, and the second group is the larger.

On illumination, the systems did what they are built to do. The association found that the adaptive system "maintained high beam operation in all areas except those intentionally shaded by the system to minimize glare", while in the same circumstances "the U.S. specification vehicles were forced to reduce headlamp operation to low beam in order to minimize the likelihood of producing glare to oncoming and preceding vehicles". The resulting increase in roadway lighting "could be as much as 86 percent".

On glare, the findings run against the position the Foundation might have been expected to take, and the Foundation states them without qualification. All four vehicles "scored in the low perceived glare range of the evaluation scale, ranging from 'Satisfactory' to 'Just Acceptable'". One

manufacturer's adaptive European vehicle rated better than its United States counterpart and the other manufacturer's rated worse. On the scenario the association identified as the worst case, it reported that "Roadways with hills were the most common driving scenario where other drivers were subjected to potential glare by an ADB capable vehicle", that all headlamp systems then available produce glare when cresting hills, and that in that situation "it occurred less frequently with ADB capable European specification headlamp systems than with auto-dimming U.S. specification systems".

The Foundation therefore does not assert, and asks the Department not to infer, that adaptive driving beam systems produce more glare than the systems they replace. The only American measurement of the question found the opposite, and a comment that ignored it would deserve to be disregarded.

What that measurement was, and what it was not

It was five people giving a number. The association used the de Boer scale, a nine-point subjective rating on which one denotes unbearable glare and nine just noticeable, and the rating was given after each pass by the same five researchers who had conducted the illumination testing. All five were men, of ages given as twenties through fifties, and they were the association's own staff rather than naive participants, so they knew which vehicle was which. Participants were "instructed to direct their gaze straight down the test lane rather than focusing on the approaching headlamp beam".

That is a competent engineering evaluation and the Foundation does not disparage it. It is simply not an answer to the question the agency's definition raises. A rating of seven on a nine-point discomfort scale by five informed observers establishes that five informed observers found the experience tolerable. It does not measure distraction, which was not assessed at all. It does not measure disability glare, contrast threshold, recovery time, or any physiological variable. And it involves no exposure of any duration: each researcher rated a single pass of a vehicle at thirty-five miles an hour.

The exposed person the test did not include

The observation point in the glare test was a parked car with its lower beam headlamps lit, and the test vehicle approached it at thirty-five miles an hour on a closed course. That is the stimulus these systems are built to detect. The thing being measured was how well the system shades the object it was designed to recognize.

A pedestrian is not that object. Neither is a cyclist, a person waiting at a bus stop, a person standing in a driveway, or a person at the window of a house on a bend. The system withdraws its upper beam from vehicles it detects and holds it everywhere else, which means that for everyone who is not in a car the technology represents an increase in exposure and not a decrease. The submission described at Part VI.B.1 makes the point in terms, reporting that "ADB systems are not detecting all road traffic participants, for example at crossings".

The association's own framing supplies the scale of the question it did not ask. Its abstract records, citing the agency, that approximately 25 percent of automotive travel occurs at night but that nearly 52 percent of driver fatalities and 71 percent of pedestrian deaths occur in dark conditions. The population most exposed to vehicle forward lighting after dark, and most at risk in the dark, is the population the evaluation did not place at the observation point.

The condition of exposure that is new

Every other product in this Part emits a pattern that is fixed, or that changes on a cycle. An adaptive driving beam emits a pattern that reconfigures continuously in response to what its sensors detect. Vehicles enter and leave the shaded region; the shadow travels across the scene as the geometry changes; and on crests, bends and at junctions, which the association identifies as the conditions

where these systems fail, the pattern changes abruptly. A person standing outside a vehicle receives, in place of a steady beam or a single dip, a high-intensity field that is rearranging itself.

The Foundation states carefully what it does and does not claim about that. It does not claim that this produces any neurological or psychological effect, and it is aware of no study that has looked. What it claims is narrower and is a claim about the record rather than about the body: that no measurement protocol identified anywhere in this comment characterizes a high-intensity source whose spatial pattern changes continuously, that the instruments and criteria set out at Part V.D were written for modulation in time rather than reconfiguration in space, and that the attention effects treated at Part VI.J.7 and the persistence effects at Part V.E.7 were established for stimuli of a different kind. The question is open because it has not been asked.

Which agency asserts jurisdiction, and what the test is

The National Highway Traffic Safety Administration does, under Federal Motor Vehicle Safety Standard No. 108, and the position has changed within the period this comment covers. The association reported in April 2019 that "Section 9.4 of the standard expressly prohibits simultaneous operation of high and low beam headlamps, thereby excluding adaptive driving beam headlamp systems from vehicles sold in the U.S." The agency has since conducted a rulemaking permitting these systems.

What the test is, in either regulatory posture, is photometric. The standard asks whether the lamp delivers specified intensities at specified angles and, for these systems, whether the shaded region is adequately dark where a detected vehicle is. It does not ask what the pattern does to a person, and the agency that administers it told the Foundation on 13 February 2024 that "NHTSA's focus is on automotive safety, but the agency recognizes that separate expertise resides in sister agencies that are health-focused, such as the Food and Drug Administration."

What the Foundation asks

Not that adaptive driving beam systems be prohibited, and not that the Department find them harmful. The Foundation asks three things that follow from the statute and from the agency's own definition. First, that the Department treat the question whether this technology causes discomfort or distraction as a question within paragraph 360ii(a)(4), since it concerns the conditions of exposure to electronic product radiation and since the agency regulating the product has made the absence of both a defining feature of the product. Second, that under paragraph 360ii(a)(3) the Department ask that agency what evidence exists for the clause, because the Foundation has found one evaluation resting on five observers and no study of distraction at all. Third, that any inquiry take as its exposed person someone who is not in a vehicle, since that is the person these systems do not detect and the person the only American evaluation did not test.

3. Daytime running lamps

What the products are

Forward-facing lamps operated continuously while the vehicle is in motion by day, at an intensity below that of a lower beam headlamp but far above that of a position lamp. They are not required equipment in the United States and are not prohibited, which places them in the category Part VI.C.1 describes as additional lamps and subjects them to the structure that subsection sets out.

Who is exposed, and under what conditions

Oncoming drivers, pedestrians and cyclists, by day, from every vehicle so equipped, continuously rather than on actuation. The daytime condition is what distinguishes this class from the rest of Part VI.B. The conditions Part V.D.1 and Part V.C.3 identify as the ones under which glare does its work, which are darkness and a dark adaptation field, are absent. What is present instead is a small, high-luminance source in the visual field at all times, and Part V.B.2 sets out why source luminance rather than luminous intensity is the quantity that governs the appearance of such a source.

Which agency asserts jurisdiction, and whether any emission limit applies

The National Highway Traffic Safety Administration, through Federal Motor Vehicle Safety Standard No. 108, described at Appendix D.2. The Foundation has identified no maximum luminance for a lamp of this class, and no limit on its spectral content or on the uniformity of its emitting surface. Part VI.B.1 sets out the structure of the standard as it applies to forward lighting and the Foundation does not restate it.

What the Foundation asks as to this class

One thing only, and it is a question of necessity rather than of safety, which is the question paragraph 360ii(a)(2) directs the Secretary to ask. Part III.A sets out the two questions a boundary has to answer, of which the second is whether the emission is necessary. A lamp operated by day, for conspicuity, at an intensity selected without reference to any criterion of exposure, is the clearest case in this Part for asking whether the quantity emitted exceeds what the function requires. The Foundation does not assert that it does, has no measurement of it, and asks that the question be put to measurement at Part IX.C.

4. Tail lamps, brake lamps, and turn signals

What the products are

The rear and side signaling lamps: tail lamps, stop lamps, turn signal lamps and hazard warning lamps. Unlike the forward lamps at subsections 1 to 3 these are signaling devices rather than illuminating ones. Their function is to be seen rather than to light the road, which means their output is not constrained by any task requirement and can be raised without affecting what the driver of the equipped vehicle can see.

Who is exposed, and under what conditions

The driver immediately behind, at the closest sustained range of any exposure in this Part other than the interior lighting of the vehicle itself: a following distance at night, for the duration of the journey, with the lamps in the center of the visual field and no means of looking away. A report at Appendix A.3 describes an oncoming turn signal of this class presenting a source so small and so bright that the reporter could not look at it, and Part VII.B.1 collects the accounts of ocular pain, glare and afterimage in which lamps of this class appear.

Two characteristics compound in this class and Part III treats each separately. The first is the geometry: these lamps have been reduced to arrays of small, discrete, high-luminance points, so the luminance of the emitting surface has risen while the luminous intensity of the lamp may be unchanged, which is the distinction Part V.B.2 sets out. The second is the temporal characteristic: a stop lamp appears abruptly, and a turn signal and hazard lamp modulate deliberately, so Part III.E.2 on rise and decay times reaches this class directly. The Foundation has located no specification of rise and decay times for any lamp in it.

Which agency asserts jurisdiction, and whether any emission limit applies

The same standard and the same agency. The Foundation states one distinction in this class's favor, because the comment should not claim that no maximum exists anywhere in vehicle lighting: the standard prescribes photometric requirements for these lamps in candela, and the Foundation records at Part VI.B that this is the only product class in this Part for which a federal standard sets numerical limits on emission. What the Foundation has not identified is any limit on the luminance of the emitting surface, any limit on the spatial uniformity of the array, or any specification of the rise and decay times of a signal.

What the Foundation asks as to this class

That the luminance of the emitting surface be measured for representative lamps, since the quantity the standard regulates is not the quantity that governs how the lamp appears, and that the rise and decay times of stop and signal lamps be measured and considered. Part IX.C for the measurement,

Part IX.I.5 for the question whether abrupt digital transitions are necessary to the signaling function.

5. Aftermarket lamps and light bars

What the products are

Lamps fitted after manufacture and not required by any standard: auxiliary driving and fog lamps, roof and bumper light bars, rock and underbody lighting, replacement bulbs of a different source technology fitted into housings designed for another, and the decorative lighting applied to the exterior of a vehicle.

Why this class is different from every other in Part VI.B

Because the federal instrument that governs vehicle lighting largely does not reach it, and Part VI.C.1 sets out the mechanism. For lamps the standard requires, it prescribes photometric performance. For additional lamps it does something different, which is to ask whether the added lamp impairs the effectiveness of the lighting equipment the standard does require. That is a test about the interaction between lamps on one vehicle. It is not a test of what the added lamp emits, and a lamp of unlimited intensity can satisfy it so long as it does not degrade the others.

The replacement-bulb case deserves separate mention because it is the most common. A housing designed around a filament source has its optical design built around the position and extent of that source. A substitute source of different geometry placed in the same housing produces a beam pattern the housing was not designed to produce, and Part V.B.2 sets out why a smaller, brighter source in the same reflector raises luminance and scatters light outside the intended pattern. The Foundation records that this is a matter of optics rather than of compliance, and does not state what the regulatory position of such a substitution is.

Who is exposed, and what the record contains

Oncoming and following drivers, pedestrians and cyclists. This class appears in the incident record more often than its share of the vehicle fleet would suggest, and Part VII.B.1 and Part VII.E collect the accounts, including the accounts of drivers ceasing to drive at night which Part VII.E.3 treats.

What the Foundation asks as to this class

That the impairment test be recognized for what it measures, which Part VI.C.1 sets out, and that the characterization at Part IX.C extend to lamps of this class, since they are electronic products emitting electronic product radiation whether or not any vehicle standard reaches them. The Foundation makes no request to the agency that administers the vehicle standard, for the reason Part VIII.H gives: this comment does not ask this Department to enforce or interpret another agency's regulation.

6. Automated vehicle lighting, and the question of technical feasibility

Why a technology not yet deployed belongs in this taxonomy

Every other subsection of this Part describes a product that exists and an exposure that is occurring. This one does not, and the Foundation gives its reason at the outset. Section 360kk(a)(2) directs the Secretary, in prescribing a performance standard, to consider among other things the reasonableness and technical feasibility of the standard as applied to a particular class of electronic products. Technical feasibility is not a fixed property. It is a fact about the state of the art at the time the question is asked, and in this product class it is about to change in a way it has not changed since the headlamp was invented.

The source, and what kind of document it is

Stone T., Santoni de Sio F. and Vermaas P. E., Driving in the Dark: Designing Autonomous Vehicles for Reducing Light Pollution, Science and Engineering Ethics (2019), described at Appendix C.105.

The authors are at the Delft University of Technology, in industrial design and in the ethics and philosophy of technology. The paper is open access under Creative Commons Attribution 4.0.

It is a work of philosophy, and the Foundation states that before using it. It reports no measurement of anything. It contains no health data, and the Foundation has checked rather than assumed: in seventeen pages the words glare, headlamp, retina, eye, blue light, circadian and melatonin do not appear at all. Its three references to human health are passing citations to secondary literature. No proposition in this comment about any biological effect rests on it, and none could.

The claim the Foundation takes from it

The paper's thesis is that a vehicle navigating by ranging sensors and stored maps does not require visible light in order to move safely, and that this makes the lighting of roads and vehicles a design choice rather than a necessity. The authors put it in terms of what such a system would require: a continuous investment in "systems that require little or no lighting to navigate at night", and they state that this "can potentially allow autonomous systems to drive in total darkness". The object of the exercise is stated as plainly: "designing autonomous vehicles to function without both streetlights and headlights".

The authors are candid that this is a proposal rather than a prediction and that it would require changes of regulation and of habit. They imagine the reaction themselves: "One can imagine some initial hesitation to being a passenger in an autonomous vehicle travelling 120 km/hr with no lights above, no headlights, and no brake lights!"

Why that is a statutory fact and not a preference

For the whole history of the motor vehicle the emission of a headlamp has been inseparable from the function of the vehicle. The driver needed the light in order to see, and so every question about limiting the emission ran immediately into the objection that the limit would disable the product. That objection is the reason the standards in this field are written as floors. Part VI.B.1 sets out the consequence: at the points where the beam is required to be brightest, Standard No. 108 specifies a minimum and no maximum.

A vehicle that navigates by light detection and ranging, radar and stored maps does not need the light to see. If such vehicles are deployed, the visible emission of their forward lighting is severed, for the first time, from the function of the vehicle. Whatever emission remains is there for other reasons: to make the vehicle conspicuous to people outside it, to reassure the people inside it, to satisfy a standard written for a driver, or because that is how vehicles have always looked. Those may be good reasons. They are not the reason the emission was previously unavoidable.

The Foundation puts the consequence in the statute's own terms. Part II.H.3 establishes, from paragraph 360ii(a)(2), that the Secretary is directed to develop techniques for minimizing unnecessary electronic product radiation, and that the categories engineering practice calls light pollution — glare, light trespass, uplight and over-illumination — are that statutory subject named in another vocabulary. Each of those is radiation that serves no illumination purpose or defeats one. In the vehicle class the necessity of the illumination purpose has never before been open to question. Here it is.

And the question that follows is the one section 360kk(a)(2) requires the Secretary to ask: what is technically feasible for this class. A limit on the luminance or the spectral content of forward lighting that would have been infeasible for a vehicle whose driver depends on the beam is not obviously infeasible for a vehicle that does not. The Foundation does not assert that any particular limit is feasible. It asserts that the feasibility analysis is about to rest on different facts, and that nobody has begun it.

What the Foundation does not take from this paper, and says so

Most of the paper is devoted to articulating the values that the authors say darkness serves, and they set out eight of them in a table. Several are outside anything this comment asks for, and the

Foundation names them rather than letting a reader suppose otherwise: stellar visibility, described as preserving conditions for access to the firmament; wonder and beauty; connection to nature; and heritage and tradition. Those are reasons a society might choose to light less. They are not reasons within the authority this comment addresses, and the Foundation does not advance them.

The boundary the Foundation observes is the one stated at Part II.H.3 and again at Part VI.B. It does not ask this Department to regulate the appearance of the night sky, and it does not ask any agency to take up the aesthetic or cultural case for darkness. What paragraph 360ii(a)(2) reaches is radiation that is unnecessary, measured at the point where it meets a person. The present subsection uses this paper for one thing only: the demonstration that in this product class the word unnecessary is about to acquire a different scope.

The timing argument, which is the paper's methodological claim

The authors' reason for writing now is that the technology is not finished. Their abstract states that "autonomous vehicles are currently still a technology in development, and not one that has acquired its definitive shape, meaning the design of both the vehicles and the surrounding infrastructure is open-ended", and the argument of the paper is that values are to be incorporated during that phase rather than retrofitted after it.

The Foundation adopts that observation and not the ethical framework built on it. Part I.C.7 sets out what happened the last time a lighting technology reached the market faster than the understanding of its effects. The emission characteristics of diode lighting were fixed by manufacturing and by standards written for the sources it replaced, and the questions this comment puts are being asked about a fleet already in service. Automated vehicle lighting is at the stage diode lighting was at before that happened. The cost of asking the feasibility question now is a study. The cost of asking it in fifteen years is the cost of every retrofit in Part VI.

What the Foundation asks

Two things, and both are modest. First, that in any study undertaken under paragraph 360ii(a)(4) of the emission of, and conditions of exposure to, radiation from vehicle forward lighting, the Department treat automated vehicles as a class whose technical feasibility under section 360kk(a)(2) differs from that of driver-operated vehicles, and record what that difference is. Second, that under paragraph 360ii(a)(3) the Department raise the question with the National Highway Traffic Safety Administration while the design of these vehicles remains open, since that agency is conducting the rulemaking that will fix it and has told the Foundation twice that the health expertise is here.

C. Emergency, Warning, and Flashing Lamps

1. Police, fire, and emergency medical service lamps

What the product is

The class comprises the warning lamps fitted to police vehicles, fire apparatus and ambulances: roof-mounted light bars, grille and visor lamps, mirror-mounted and surface-mounted lamps, and the rear directional devices fitted to apparatus working in the roadway. The emitters are light-emitting diodes in substantially every current product, and the operating pattern is the point of the device. These lamps do not modulate as an artifact of their drive electronics, which is the subject of Part V.D. They flash because flashing is the function for which they were specified, at rates and in patterns chosen by the purchaser from those the manufacturer offers.

The Foundation draws the distinction at the outset because it governs everything in this subsection. Part V.D concerns modulation nobody wants, and every source relied on there treats it as a defect to be minimized. Here the modulation is the product. No source in Part V.D addresses a device whose purpose is to flash, and the Foundation does not transfer their conclusions to one.

Who is exposed, and under what conditions

Three groups, and the conditions distinguish them. Occupants of the vehicle and responders working beside it are exposed at close range for the duration of an incident, which may be hours at a roadway scene. Other road users are exposed while approaching, passing or waiting, typically for seconds to minutes, at distances from a few meters to several hundred. Residents and pedestrians near an incident are exposed for its duration without any means of withdrawing, which at a residential address or an apartment frontage may be prolonged and repeated.

The conditions are those the sources at Part V.D.1 and Part V.D.2 identify as the ones their metrics and instruments do not reach. Exposure is predominantly at night, against a dark field, from a small bright source at distance, to an observer whose eyes are moving across a wide scene. The authors of the experiment at Appendix C.90 exclude exactly those conditions from their one frequency recommendation. The stroboscopic measure is stated by its own specialists to be inapplicable in dark environments and outdoor lighting. The field instrument described at Appendix D.3 is specified for about 100 lux. Whatever is known about flashing light in interiors, this class is operated where the measurement framework stops.

Which agency asserts jurisdiction, and what the test is

The National Highway Traffic Safety Administration asserts jurisdiction over motor vehicle lighting through Federal Motor Vehicle Safety Standard No. 108, described at Appendix D.2. The structure of that standard is the fact this subsection turns on, and the Foundation sets it out carefully because the distinction is easy to state loosely and the comment gains nothing by doing so.

For the lamps the standard requires, it specifies activation: “Each lamp must be activated as specified, in the combinations specified, and in response to the inputs specified in Table I and Table II”. It specifies photometric performance as luminous intensity in candela at defined angular test points, as Part VI.B records. And it treats steadiness as the normal condition of required lighting: a taillamp is defined as one of the “steady burning low intensity lamps used to designate the rear of a vehicle”, daytime running lamps are required to operate “in a steady burning state”, and headlamp obstructions are assessed “When activated in the steady burning state”. The Foundation states what it has not established rather than asserting more: whether Tables I and II specify steady burning for each required lamp, the Foundation has not read, and the comment therefore does not claim that the standard contains a general steady-burning clause.

A warning lamp on an emergency vehicle is not a lamp the standard requires. It is an additional lamp, and for additional lamps the standard does something different, which the agency has stated in its own words. In an interpretation letter of 6 May 2019, the agency’s Chief Counsel wrote: “Non-required (or ‘auxiliary’) lamps, while still regulated under FMVSS No. 108, are not required to meet specific performance requirements in the same way that the required lamps are”. What applies instead is the impairment provision at S6.2.1, under which no additional lamp may be installed “that impairs the effectiveness of lighting equipment required by this standard”; and of that test the same letter says that “The question of whether an auxiliary lamp impairs required lighting equipment is usually decided on a case-by-case basis”.

The Foundation asks the Department to read the impairment test for what it measures. It asks whether an added lamp degrades the performance of the other lamps on the same vehicle. It is a test about the vehicle. It does not ask what the lamp does to the eye of a person who sees it, and it could not, because nothing in the standard is expressed in a quantity that would answer the question.

Whether any federal emission limit applies

The Foundation has not identified one. The standard sets no ceiling on the luminous intensity of an auxiliary warning lamp, no limit on its flash rate, no limit on its modulation depth, no requirement as to its spectral content, and no limit that varies with ambient light. The only

instrument the Foundation has identified that addresses the intensity of such lamps is SAE J595, Directional flashing optical warning devices, which is a voluntary standard of a private body, is not federal, and is given effect only where a State equipment code adopts it. The negative claim is the Foundation's.

Two consequences follow, and the Foundation separates them because they are addressed to different things. The first is about this product class: a device whose entire function is to produce high-intensity flashing light is, federally, subject to one question, which is whether it interferes with the headlamps and tail lamps of the vehicle carrying it. The second is about the comment as a whole: Part V.E.1 sets out, from the authors of the governing recommended practice, that seizure risk runs from about 3 to about 70 hertz with a peak at 15 to 20, that risk rises with log luminance, that contrasts above 10 percent are potentially a risk, that central vision is more at risk than the periphery, and that "Deep red flicker and alternating red and blue flashes may be particularly hazardous". Not one of those parameters is addressed by any federal requirement applicable to this class.

The justification, and why the Foundation addresses it here rather than waiting

Any proposal touching these devices meets one answer, which is that responders need them to reach emergencies quickly. The Foundation takes that answer seriously, does not dispute that emergency response is urgent, and does not ask that any responder be deprived of a warning device. It records instead what the emergency services themselves have adopted as their position, because the question of operational necessity is theirs and not the Foundation's.

The document is described at Appendix D.1. It is a joint position statement of fourteen organizations, including the American College of Emergency Physicians, the International Association of Fire Chiefs, the National Association of EMS Physicians, the National Association of State EMS Officials and the National Volunteer Fire Council. The Foundation states its scope first: it concerns the operational decision when to switch lights and siren on, its safety concern throughout is the risk of collision, and it says nothing whatever about the optical characteristics of the lamps. It is cited for necessity and for nothing else.

What the sponsors state. That the devices do help in some cases: "In selected time-sensitive medical conditions, the difference in response time with L&S may improve the patient's outcome". That the time they save is small: "Over a dozen studies show that the average time saved with L&S response or transport ranges from 42 seconds to 3.8 minutes". That the occasions on which it matters are few: of responses to medical calls, "few (6.9%) of these result in a potentially lifesaving intervention by emergency practitioners". That the practice is nonetheless general: "L&S continue to be used in 74% of EMS responses, and 21.6% of EMS transports". And the finding the Foundation asks the Department to weigh longest.

> "Some agencies have used an evidence-based or quality improvement approach to reduce their use of L&S during responses to medical calls to 20-33%, without any discernable harmful effect on patient outcome".

The sponsors' own recommendation follows from that: lights and siren "should only be used for situations where the time saved by L&S operations is anticipated to be clinically important to a patient's outcome. They should not be used when returning to station or posting on stand-by assignments". And their closing statement: "In most settings, L&S response or transport saves less than a few minutes during an emergency medical response, and there are few time-sensitive medical emergencies where an immediate intervention or treatment in those minutes is lifesaving".

What the Foundation takes from this, and what it does not

It does not take, and does not assert, that these devices are unnecessary or should be removed. The sponsors say the opposite in selected conditions and the Foundation adopts their statement rather than trimming it. It does not take any proposition about optical hazard from a document

that addresses collisions. And it draws no inference about police practice: the sponsoring bodies are of emergency medicine, fire, ambulance and dispatch services, law enforcement appears in the statement only in one occupational statistic, and no police organization is a sponsor.

What it takes is narrower and is about the burden of justification. When this Department asks whether the emission characteristics of this product class should be subject to a performance standard, it will be told that the devices are operationally necessary. The answer to that is not the Foundation's opinion. It is that fourteen organizations of the services that operate them have adopted the position that their use should be confined to the occasions when the time saved is clinically important, that the time saved is between 42 seconds and 3.8 minutes, and that agencies which cut their use to between a fifth and a third of responses saw no discernible harm to patients. A requirement addressed to how bright these lamps may be, how fast they may flash, and how deeply they may modulate would not interfere with any use the services themselves regard as justified.

The color combination, which has not been raised anywhere in the regulatory record the Foundation has read

Every criterion discussed above is expressed in rate and intensity. None addresses color. The neurophysiological literature does, and what it says bears directly on this product class.

The review at Appendix C.96 sets out the interaction between color and flash rate for the induction of photoparoxysmal responses. It reports the conclusion of Parra and colleagues that "white lights flashing at higher frequencies (above 20 Hz) can induce epileptic seizures, but that for coloured stimuli (e.g., blue and red) the risk is greatest at frequencies around 15 Hz". Its summary table gives three bands: at 10 to 15 hertz color stimulation exceeds white light; at 15 hertz the entry is red-blue alternating stimulation; and at 20 to 30 hertz color and white are equivalent. Among colored stimuli the review reports that the combination of blue and green elicited the fewest epileptiform responses.

The reason that combination is identified is a documented mass incident. The review records that cases of seizure were reported in children watching a television broadcast in which, in its words, "an intense blue-red light flashed at a frequency of 15 Hz", and that later work attributed the effect to stimulation of the long-wavelength cones, with the qualification that the relationship is not clear because some individuals respond similarly to green.

The operational conclusion the review draws is addressed to researchers, and it is the sentence the Foundation asks the Department to read against the contents of this subsection. Because flicker testing itself carries a risk of inducing seizures, the authors write, "every effort must be made to avoid high-risk combinations, which include, for example, red-blue light flashing at 15 Hz".

Red and blue alternating is the color scheme of American emergency vehicle warning lighting. A stimulus that a peer-reviewed review instructs investigators to avoid presenting to consenting volunteers under ethical supervision in a laboratory is presented, without consent, without notice, without any measurement of record and without any limit in federal law, to whoever is on the road.

The Foundation states two limits on that comparison in the same place, because it will not put the point to the Department without them. The first is spatial. The broadcast incident involved a television screen at domestic viewing distance, which satisfies the visual angle condition that the photoepilepsy criteria require and which Part VI.I shows a vehicle-scale lamp does not satisfy beyond very short range. The same gate that fails for the deterrent strobe fails here, and for the same reason. The second is that the Foundation has no measurement of the flash rate or the chromaticity of any American emergency vehicle light bar. It has one measurement of one lamp, reported at Part VI.I, which was measured at 20.9 hertz and is blue.

What the Foundation therefore asserts is not that emergency vehicle lighting induces seizures. It is that the one variable the clinical literature identifies as raising risk at the lowest flash rates is the

variable this product class is defined by; that no instrument in American law addresses it; that no federal body has measured it; and that the question appears nowhere in the regulatory record this comment has assembled, including in the correspondence of the agency that publishes the flash rates.

The premise beneath this product class, and the one time it has been measured

Everything in this subsection proceeds from an assumption that is never stated in the instruments that govern these lamps: that a device which captures more of a driver's attention is for that reason safer, so that brighter and faster is better without limit. Part VI.C.2 records that the governing manual specifies flash rates and intensity classes and contains no criterion expressed in terms of effect on a person. The assumption is what fills that gap.

The Foundation has found one rigorous test of that assumption, and it is set out at Part VI.J.7 and Appendix C.97. A roadside intervention designed to capture attention was measured against eight years of crash data and was found to increase crashes, with the increase rising as the display became more arresting, and with the authors concluding that interventions can be too salient and so crowd out more important considerations.

That study measured message content and not emission, and the Foundation does not represent it as measuring a lamp. It is set beside this product class for one purpose: to establish that the premise on which the class is built is a testable empirical claim rather than a self-evident one, that it has been tested once, and that it failed. Whether it holds for a high-intensity flashing lamp is unknown, which is the condition this comment describes throughout and the reason it asks the Department to exercise paragraphs 360ii(a)(4) and (a)(5).

The criteria that exist for this hazard, and what the body that wrote them says about this product class

The comment has now obtained the document on which the secondary sources in this Part rely, which is the Epilepsy Foundation's updated review of visually sensitive seizures, described at Appendix C.98. It states the criteria directly:

> "In 2005, a panel convened by the Epilepsy Foundation of America concluded that a flash is a potential hazard if it is brighter than 20 candelas per square meter, occupies at least 10% of the visual field, flashes or changes color at a frequency between 3 and 60 Hz, and endures for at least half a second."

Four conditions, conjunctive. The review adds that avoidance of these characteristics "is estimated to be protective for at least two-thirds of people with epilepsy", which is both a statement of the criteria's value and a statement of their limits.

What the same review says about this product class, which the Foundation places here rather than anywhere less prominent

The review addresses flashing emergency lighting expressly, and what it says is adverse to the position a reader might expect this comment to take:

> "Flashing police car lights only rarely provoke seizures, perhaps because the image rarely occupies a large part of the visual field."

The Foundation reports that sentence in full, in the subsection where it does the most damage, because a comment that buried it would deserve to be disbelieved about everything else. It is the considered view of the leading expert body in the field, published in 2022, with the author of much of the flicker literature this comment relies on among its signatories.

Three observations follow, and none of them is a denial.

The first is that the sentence is about seizures and about nothing else. The Foundation's case on these lamps, set out in this Part and at Part VII, concerns disorientation, migraine, visual

impairment, after-image and loss of access to public space. The review does not address any of those in relation to vehicle lamps, and the Foundation does not suggest that it does.

The second is that the stated reason is the one this comment has independently reached. The image rarely occupies a large part of the visual field. That is the third of the four criteria above, and it is the same quantity that Part VI.I finds a measured lamp failing to meet beyond about forty centimeters. The Foundation accepts the mechanism. What follows from accepting it is that the exposures where the criterion is met are the close ones: the traffic stop, the person on the sidewalk beside a stopped vehicle, the occupant of a car halted beside a light bar at night. Those are real and they are common, and the review does not say they are safe. It says the image rarely occupies a large part of the visual field, which is a statement about frequency of occurrence and not about what happens when it does.

The third is evidentiary. The sentence carries a single citation, appears in a passage on differential diagnosis rather than in the review's treatment of stimulus characteristics, and is qualified by the word perhaps. Section 8.6 of the same review states that the effect of light-emitting diodes on people with epilepsy would benefit from additional research, and records a literature search finding five results. The Foundation does not read a qualified sentence resting on one citation as a finding that this product class is safe, and neither, on the evidence of section 8.6, do its authors.

A regulatory precedent, from the same section, that the Foundation has found nowhere else

The review's section on regulatory issues records what other countries have done. Most of it concerns broadcast content. One sentence does not:

> "In the UK, devices that flash in public are limited to frequencies no higher than 4 Hz, and they should not be visible from stairways."

That is a numerical limit on a physical device in public space, not on content on a screen. It is the only instance the Foundation has found, in any jurisdiction, of a flash-rate ceiling imposed on the class of equipment this Part describes. The lamp measured at Part VI.I operates at 20.9 hertz. The Foundation draws two things from the existence of that rule. A limit of this kind is evidently capable of being written, since one has been written. And the objection that such a limit would be impractical, which the Foundation anticipates, is answered by the fact that a comparable economy has lived with one.

The review also records that "Frequency, brightness, binocularity, and large area are all key factors in contributing to seizure provocation", and that prevention "can take place at the level of government regulation, industry, families, and individual patients", naming government regulation first. The countries it identifies as having implemented regulation are the United Kingdom, Japan, Russia and Italy. The United States is not among them.

The premise tested directly, on this product class, in a study the federal government paid for

The preceding paragraphs set the premise beside a study of roadside message signs, and recorded that the extension from message content to a lamp was an inference. That inference is no longer needed. The premise has been tested on emergency vehicle warning lights themselves, at night, by researchers under contract to the United States Fire Administration. The report is described at Appendix D.4.

The authors state the regulatory position in their introduction, and the Foundation asks the Department to notice who is saying it:

> "standards that define the minimum photometric performance of flashing emergency lights (Society of Automotive Engineers, 2014, 2019; National Fire Protection Association, 2016), but no maxima, have not changed substantially since LED light sources have become widespread"

And the consequence of that asymmetry, in the same passage: “these flashing lights, designed to capture attention and warn drivers of changing conditions, have increased in intensity as the efficacy of LED sources has increased”. The authors then state the concern this Part has been built on, in their own words: “If lights are excessively bright, they could hinder drivers’ ability to see first responders working adjacent to their parked vehicle, or create unwanted visual discomfort, potentially reducing first responder safety.”

What the experiment found about intensity

Twenty licensed drivers drove a closed course past a simulated nighttime incident scene under fourteen combinations of intensity, color, modulation, flash rate and reflective marking, rating the visibility of the lights and the discomfort glare they produced. The low intensity condition was set at about one-third to one-half of the minimum specified by National Fire Protection Association Standard 1901 for large fire trucks. The high condition was about one-third above that minimum.

The finding, in the authors’ own summary:

> “higher intensity lights present more glare, but those higher intensities do not necessarily make lights more visible at night”

The statistics are asymmetric in the same direction. Intensity had a significant effect on rated visibility and a markedly stronger one on discomfort glare. Both intensity levels were rated between 1.5 and 2 on a scale whose maximum is 2, which is to say that both were already at the ceiling of visibility. The authors conclude:

> “Lights that meet existing minimum intensity requirements (like those from NFPA) for emergency vehicles may be brighter than needed for nighttime driving conditions, at least when the emergency vehicles were stationary as in the present study. Using lower intensities at night will reduce discomfort glare without reducing their visibility.”

The Foundation states the significance of that sentence precisely. Lamps operating at one-third of the consensus minimum were nearly as visible as lamps above it, and substantially less glaring. The minimum is therefore not a floor below which the device fails to warn. It is a floor set without reference to the point at which warning is achieved, and the only federally funded test of it found that the point is below the floor. The authors recommend that the question be taken further, asking “whether reducing intensity levels of flashing lights at night (or specifying maximum limits to intensity) is beneficial to the safety of first responders”.

What it found about color, which bears on the spectral argument of Part V

Color had a larger effect than intensity on both measures. Blue and red were rated most visible; blue and white most glaring; red and yellow least glaring. “The range between the least and most glaring color was about twice the range between the low and high intensity levels in this study.”

The authors attribute the glare result to spectral content: “light sources with greater short-wavelength (‘blue’) spectral or color content were consistently judged as more glaring than yellow or red lights of the same intensity”, and “Blue lights in particular of high intensities can elicit high levels of discomfort glare.” They also state, in passing and in support of the account at Part V.B.5, that “white LEDs are actually blue LEDs equipped with a phosphor coating that converts some of the blue light into yellow light with the mixture appearing white”.

Their preliminary recommendation follows from the two results together: “This suggests that red lights for stationary blocking operations would be judged as most visible but produce the least amount of glare, compared to the other colors tested in this study.” The Foundation records that this is a recommendation about which color to use and not about whether to flash, and does not present it as more.

What the study found against the Foundation, which is set out here and not left to a reader

Three results are adverse or null and the Foundation reports them in the same subsection as the favorable ones.

There was no moth-to-flame effect. “None of the results of the study contained evidence of a ‘moth-to-flame’ effect or its opposite. Study participants drove no closer to or farther from the lights regardless of their intensity or color.” The Foundation does not assert such an effect anywhere in this comment and records the finding because the claim is commonly made.

Flash rate and modulation had no statistically significant effect on anything the study measured: not on rated visibility, not on discomfort glare, not on the visibility of the road scene, not on lateral offset, and not on the distance at which drivers detected a responder. The Foundation states the scope of that null rather than minimizing it. Two profiles were compared, one of four thirty-millisecond pulses separated by twenty milliseconds followed by a two-hundred-millisecond pulse repeating seventy-five times a minute, and one of a single four-hundred-millisecond pulse repeating sixty times a minute. The outcome measures were subjective ratings of visibility and discomfort by twenty people. The study did not measure any neurological response, and nothing in it bears on the criteria at Appendix C.98 or on the recommended practice at Appendix D.2, which concern effects that a rating of discomfort would not capture.

And no variable had a significant effect on the rated visibility of the overall road scene.

One further result was unexpected and points the same way as the intensity finding. High-reflectivity chevron markings appeared to make responders harder rather than easier to see: “the presence of high-reflectivity chevron markings seemed to make it more difficult for drivers to see responders working around their vehicles at night, even when the responders wear safety vests”. The difference was about twenty-five feet and was not significant on its own, but produced a significant interaction with intensity, and the authors suggest that a maximum specification for reflective sheeting might be appropriate. The Foundation includes it because it is a second instance, in the same study, of a conspicuity measure applied without a ceiling and found to work against the thing it was meant to protect.

The authors close the introduction with the sentence this comment would otherwise have had to assert for itself: “There is a need for additional work to investigate the role(s) of lighting intensity, flash rates, color, and other factors in helping to prevent emergency responders from being involved in crashes and being struck while working on the roadway.”

Why the equipment is selected as it is, which the Foundation has nowhere else been able to source

This Part has described a product class governed by minimums without maximums, and has not until now been able to say what fills the space above the minimum. A technical paper presented to the SAE World Congress in 2019, described at Appendix D.6, states it:

> “Anecdotal evidence suggests that public safety agencies select emergency lighting systems with red or blue flashing lights based on their apparent brightness, with brighter lights judged as ‘better.’”

The authors call it anecdotal and the Foundation repeats the word. What the sentence describes is a selection criterion operating where no regulatory criterion exists: the standards set a floor, nothing sets a ceiling, and the choice within that space is made on apparent brightness by the purchasing agency. The same paper states the consequence the authors draw from it, which is the proposition the report at Appendix D.4 later tested:

> “With the advent of light emitting diodes (LEDs), emergency flashing lights are brighter and produce more highly saturated colors, thereby causing greater discomfort and disability glare. As a result, first response workers are at higher risk for being injured or killed in vehicle crashes because approaching drivers cannot see them.”

Two distinctions should be held in view. The first is that disability glare is not discomfort glare. Discomfort is a rating; disability is a measurable loss of visual performance caused by light scattered within the eye, treated at Part V.C.3. The study at Appendix D.4 measured discomfort. This paper asserts disability as the mechanism by which responders are struck, and the Foundation records that the assertion appears in an abstract it has read and in a paper it has not.

The second is authorship. The finding that blue flashing lights are perceived as brighter and more glaring than red at the same intensity is reported here and again in the study at Appendix D.4, and in this paper the word used is always. Those are two studies and not two laboratories: the lead author is the same and the group is the same. The Foundation presents them as one body of work by one group, consistent across two designs, and not as independent corroboration.

One further result is worth recording because it points away from more light rather than toward it. In the same experiment the detection of a figure standing beside the vehicle was affected by the intensity of the flashing lights, while the color of those lights did not matter, and "the presence of low-level white illumination at the side of model vehicle significantly improved detection accuracy". Steady low-level light beside the vehicle improved the outcome the flashing lights exist to serve. The Foundation does not state which way the intensity effect ran, because the abstract does not say and the paper has not been read.

An American police agency that reduced the intensity and nearly removed the flash, and what happened

The Foundation has argued in this Part that a limit on these lamps is capable of being written and that operating them differently is a matter of policy rather than of engineering. The objection it expects is that neither is practical. The answer is a state police agency that did it, at scale, and reported the result. The account is given in the magazine of the International Association of Chiefs of Police and is described, with its limitations, at Appendix D.3.

The sequence is this. In the summer of 2010 the Massachusetts State Police had eight serious rear-end collisions involving police vehicles, one of them fatal. The agency assembled a team of its own personnel, civilians, manufacturers' representatives and engineers to establish what was causing rear-end collisions with vehicles stopped on the interstate. They took into account, in the article's words, "previous studies that showed that people tend to stare at bright flashing lights and that showed impaired drivers tend to drive where they are looking".

They then tested, at a closed airfield, in daylight and at night, with subjects approaching a stopped police vehicle at highway speed. The reported result:

> "To the majority of drivers involved, the warning lights' intensity at night appeared to be far more distracting."

And: "Some subjects had to look away while approaching the car, while others could not take their eyes off the flashing blue, red, and amber glare." The conclusion drawn was that the intensity and flash rate appropriate to a daytime response are not those appropriate to a vehicle stopped on a highway at night, the agency's fleet administrator being quoted as saying they "needed to be different, and specific to the situation".

What they tested, and the finding that answers the premise

The range tested is itself the point: "from fast, bright dazzles to slower, more synchronized patterns at lower intensity. They went as far as to remove the flash element altogether and evaluate the steady non-flashing colors of light." What they adopted was a hybrid of a steady glow and a slow synchronized blue flash. Of that pattern the article reports:

> "The test subjects agreed that they were able to distinguish this hybrid flash pattern just as quickly and from the same distance as the fast, active bright pattern, but without the distractions that the bright lights caused at night."

Equal speed of detection and equal distance of detection, at greatly reduced intensity and with the flash all but removed. If that account is accurate, the premise that this Part has traced through the regulatory record does not merely lack support. It is contradicted by the operational testing of the agency that relies on the equipment.

The parameters they adopted, which the Department should compare with the parameters in service elsewhere

In the nighttime park mode the flash rate of the lower perimeter lamps was reduced to sixty flashes per minute and their intensity, in the article's words, "greatly lowered". The light bar went to a pattern the agency named Steady-Flash, "emitting a low intensity blue glow with a flicker every 2 to 3 seconds".

Sixty flashes a minute is one hertz. A flicker every two to three seconds is between a third and a half of a hertz. Set those beside the two other figures this Part has established. The United Kingdom limits devices that flash in public to no more than four hertz. The one lamp the Foundation has had measured, reported at Part VI.I, runs at 20.9 hertz. The Massachusetts State Police, for vehicles stopped at night, chose a rate below one.

The scale matters as much as the rate. The article records that as of April 2018 the agency had more than a thousand vehicles equipped with situational warning systems, and reports its fleet administrator as saying that rear-end collisions with parked police vehicles had been reduced dramatically. The Foundation presses the first fact and not the second. A thousand vehicles is a demonstration of feasibility. A collision reduction reported in an interview, without figures and without a published analysis, is not a demonstration of effect, and the comment does not treat it as one.

What the same article says about the standards

It names four bodies whose requirements govern these lamps: the Society of Automotive Engineers, the Federal Motor Vehicle Safety Standards, the Federal Specification for the Star of Life Ambulance (KKK-A-1822) and the National Fire Protection Association. It then states the structural problem this Part has described from three other sources:

> "When 10 or 20 of them are placed on an emergency vehicle parked at night along a roadway, the lights may actually be creating a condition that is less safe than a similar scenario with the older light sources, despite being compliant with the lighting standards. This is because the standards require only a minimum intensity level."

Compliance with every applicable standard, producing a condition the author believes to be less safe than the equipment it replaced, because the standards state a floor and nothing else. And one further absence, which the Foundation has not seen stated anywhere else: "Currently, none of the warning light intensity requirements from these organizations take ambient light into account, but a standard that changes based on ambient light and other conditions might ultimately reduce these rear-end collisions and distractions across the board."

That is a call, in the professional publication of American police leadership, for an intensity requirement that varies with the ambient light level. Part VI.K and Part V.D.1 set out the population and measurement evidence that the ambient level is the variable that matters most. The Foundation asks the Department to notice that the proposal is not its own.

What the Foundation does not take from this article

It is trade writing and not research. Its author is the managing partner of a fleet equipment business, so that the adaptive systems it recommends are products of the industry he works in. One of its technical sources is an inside sales manager of a warning light manufacturer. The Massachusetts testing is described qualitatively, with no protocol, no sample size, no measurements and no published report, and the previous studies it relies on are not named. The

Foundation does not cite it for the proposition that bright flashing lights cause rear-end collisions, and does not cite it for any health effect of any kind.

It is cited for three things only: that an American state police agency tested the question and changed its practice; that the parameters it adopted are a matter of record; and that the inadequacy of a minimum-only standard is stated plainly in the profession's own publication.

What practitioners are told, and one proposition that reverses the premise entirely

The sources above are regulatory, scientific and commercial. There is a fourth literature, written by practitioners for practitioners, and the Foundation treats one example of it at Appendix D.3. It is not research, it cites much of its content to unnamed studies, and the Foundation uses it for a narrow purpose. But it contains a statement about the perception of flashing light that no other source in this comment makes, and that if correct reverses the premise on which the whole product class rests:

> "Flashing lights are not perceived as quickly as steady-burn lights, but once seen, they attract and hold the attention of the viewer. Flashing lights require higher levels of light output to compete with similar steady-burn lighting."

A flashing lamp is detected more slowly than a steady one and must be brighter to be seen as readily. If that is so, then the escalation this Part has described is not an improvement over steady burning that was purchased at the cost of glare. It is a cost incurred to recover a disadvantage created by the decision to flash. The Foundation does not assert that proposition on the authority of a trade article; it records that a practitioner audience was told it, that the article attributes it to no source, and that it is the single most consequential empirical claim in this subsection if it can be substantiated. The research priority is recorded at Part V.L.

The same article quotes a maxim attributed to Stephen Solomon, a name that recurs in this literature: "Fewer lights, flashing slower & less brightly" are more effective.

The practitioner recommendation, which is the Foundation's own

Its eighth recommendation is to add steady-burn lights, on the ground that "ultra-bright or exaggerated displays of flashing lights on vehicles do not necessarily increase scene safety" and that "Excessive lighting may in fact actively contribute to increasing the accident rate around incident scenes." It describes the practice at multi-vehicle scenes of one or two vehicles continuing to flash while the remainder "switch down to steady-burn only".

The Foundation records the convergence without overstating it. The operational literature recommends steady burning at scenes. The Massachusetts State Police adopted something close to it, as Part VI.C.1 describes above. And Part VI.C.1 also establishes that steady burning is what the federal standard requires of auxiliary lamps by the agency's own long-standing interpretation. Three independent routes, from practice, from a police fleet, and from federal interpretation, arrive at the same operating state.

Night adaptation, with figures

On flashing white lamps, the article states that "At night just a short exposure to bright flashing white lamps can obliterate night adaptation in nearby drivers within seconds, thus producing temporary night blindness", and that it is "crucial that all flashing white lights are programmed to illuminate only during daylight hours". On side-mounted lamps at eye level it is more specific: a driver glancing at such a lamp "will have his night vision adaptation eliminated in less than a second - followed by secondary after-flash effects. It may take up to 20 minutes for the driver to regain their night vision. Older drivers are particularly susceptible to bright light sensitivity and loss of night-vision."

Those figures are uncited and the Foundation flags them as such. They are nonetheless the magnitudes the operational literature works with, they are consistent with the dark-adaptation

physiology described at Part V.C.3, and the susceptibility of older drivers is the finding of Part V.C.5.

A standards sequence, and a product warning

The article describes a sequence the Foundation asks the Department to note, because Part II is built on sequences of this kind. The practice of fitting flashing lamps at the waistline of emergency vehicles accelerated after National Fire Protection Association Standard 1901 was published in 2009, and similar provisions were carried into the draft of Standard 1917 for ambulances. The article then states:

> "Information has been submitted to the NFPA suggesting that placing an 'optical warning device ….between 18 in. and 62 in. (460 mm and 1600 mm) above level ground' may cause temporary blindness in nearby drivers. The latest recommendation in the draft standard places waist-height lamps exactly at the eye-level of seated drivers in an average sedan."

A standards body informed that a mounting position may cause temporary blindness, and a draft that places the lamp at the eye height of the person said to be at risk. The Foundation has not verified that account and says so at Appendix D.3. If it is accurate it belongs with the material at Part II.K on the committee process.

And one sentence that, if it can be substantiated, bears on every disclosure question in this comment: "most warning lamps are delivered with a written warning stating that eye damage will occur if the lamp is viewed at close range". The Foundation has not confirmed it, has obtained no product manual, and does not rely on it. It is recorded because a manufacturer's own hazard warning on an emission aimed at the public would be material to Part VII, to Part VIII and to the disclosure request at Part IX.F, and because it is capable of being verified by anyone with access to a product.

Where this article and the controlled evidence disagree

The article asserts the Moth Effect, the tendency of a driver to fixate on a warning light and steer toward it. The controlled experiment described at Appendix D.4, conducted under contract to the United States Fire Administration, found no such effect in either direction. The Foundation follows the controlled experiment, does not assert the Moth Effect anywhere in this comment, and records the disagreement here so that no part of this Part is read as relying on it. The same article is candid about the related Wake Effect, stating that it "has proven difficult to quantify in research despite the accumulation of large amounts of anecdotal evidence" and that despite the difficulty in proving it the existence of the problem "is widely accepted". Widely accepted is not demonstrated, and the Foundation does not treat it as demonstrated.

2. Rectangular rapid-flashing beacons and pedestrian crossing devices

What the product is

A pedestrian-actuated warning device at a crosswalk, consisting of a pair of rectangular light-emitting diode indications mounted beside the crossing sign and facing approaching traffic, which flash in a rapid pattern when a pedestrian actuates them. The class also includes the in-roadway warning lights and the overhead beacons used for the same purpose at uncontrolled crossings.

Who is exposed, and under what conditions

Three groups, and the first is the one the Foundation asks the Department to notice. The pedestrian who actuates the device stands within a few feet of it, below it, and for the duration of the crossing. The device exists to protect that person, and that person receives the most intense exposure to it of anybody. Drivers approaching receive it at distance, at night against a dark field, which is the condition Part V.D.1 and Part V.D.2 identify as the one their metrics and instruments do not reach. And residents of the dwellings adjacent to the crossing receive it whenever it is actuated, from a fixed

installation they did not choose, which is the position Part VI.P describes for light trespass generally.

Which agency asserts jurisdiction, and what the instrument provides

The Federal Highway Administration, through the Manual on Uniform Traffic Control Devices, which States adopt or amend. Part II.H.6 sets out that agency and Part VIII.B records that California's manual is discussed in the disability context. The manual specifies flash rates and intensity classes for these devices. It contains no criterion expressed in terms of the luminance of the emitting surface, the spectral content of the emission, or the rise and decay times of each pulse, and Part VI.C.1 sets out the premise the Foundation identifies in instruments of this kind: that a device which captures more of a driver's attention is for that reason safer.

One further federal instrument reaches the place rather than the device. Part II.H.11 records that the United States Access Board published its final rule on accessibility guidelines for pedestrian facilities in the public right-of-way thirteen days before the correspondence described there, and these devices are installed in exactly those facilities. The Foundation draws no inference from the proximity of the dates.

Whether any federal emission limit applies

None that bounds the quantities above. The intensity classes are specified as minima to be met rather than as maxima not to be exceeded, which is the same direction Part VIII.D.4 identifies in the visible alarm and Part VIII.E.4 identifies in trade lighting guidance generally.

What the record contains about this class, which is more than for any other

This is the device at the center of the administrative record this comment reproduces, and the Foundation sets out the sequence without characterizing it. On June 29, 2022 Mr. Baker, individually, submitted a complaint under Title II of the Americans with Disabilities Act and section 504 of the Rehabilitation Act concerning these devices in three cities. On October 19, 2022 the Office of Civil Rights of the Federal Highway Administration dismissed it without investigation, stating that the allegations raised complex issues related to the regulation of all light-emitting diode lights that extend beyond that agency's authority. On June 15, 2023 the Minnesota Department of Human Rights found probable cause on a charge concerning such a device in one of those three cities. Part VIII.E.6 sets out both documents in full, Part IV.E.1 sets out the determination, and Part II.H.18 sets out the regulatory ground of the dismissal.

Part IV.E.1 also sets out the federal actions brought by Mr. Baker individually concerning these devices. The Foundation has brought none and is a party to none, and Part IV.A.2 records the distinction between the two capacities.

What the Foundation asks as to this class

That the luminance of the emitting surface and the temporal profile of each pulse, including its rise and decay times, be measured for representative devices as installed, at the position of a pedestrian actuating the device and at the position of an approaching driver. Part IX.C. That the question whether rapid digital flashing is necessary to the warning function be addressed rather than assumed, which Part IX.I.5 sets out as a question about necessity rather than about safety. And that whatever is found be communicated to the agency that writes the manual, which Part IX.E.4 asks generally and which this class makes concrete.

3. School buses, utility vehicles, and work zones

What the products are

Three groups with one characteristic in common, which is that each is a high-intensity flashing installation operated among people on foot. School bus warning lamp systems, comprising the amber and red lamps at the front and rear of the bus. The amber warning lamps and strobes fitted to

utility, maintenance, refuse, snow and tow vehicles. And the work zone installations: arrow boards, portable changeable message signs, and the flashing lamps on barricades and channelizing devices.

Who is exposed, and under what conditions

For the school bus, children, at the closest range of any exposure in this Part. A child boarding or alighting passes within a few feet of an actuated lamp, twice a day, every school day, for years. Part IX.L sets out why that population is treated separately: Part V.C.2.g records the measured age-dependence of ocular transmission in the short-wavelength band, and Part VI.E.2 sets out the three features that make children's exposure different in kind, which are the length of the compulsory exposure, the least filtering, and no capacity to consent or to avoid.

For utility and work zone installations, workers beside them for the duration of a shift, and road users passing them. The work zone case combines the characteristics Part III treats most separately: high luminance, deliberate modulation, multiple emitters in the field of view at once, and movement through space as the vehicle or the viewer moves.

Which agency asserts jurisdiction

Divided by group. School bus lamps are vehicle lighting and fall within Federal Motor Vehicle Safety Standard No. 108, described at Appendix D.2, together with state specifications for school bus construction. Warning lamps on utility vehicles are additional lamps in the sense Part VI.C.1 describes, and the structure of the standard as to additional lamps is the impairment test that subsection sets out. Work zone devices are traffic control devices under the Manual on Uniform Traffic Control Devices.

Whether any federal emission limit applies

The photometric requirements applicable to required lamps are minima. The Foundation has identified no maximum luminous intensity, no limit on luminance, no limit on modulation depth and no specification of rise and decay times for any installation in this group. Part VI.C.1 reaches the same conclusion for emergency vehicle lamps and sets out the two consequences at greater length.

What the Foundation asks as to this class

That the school bus case be addressed first and separately, for the reason given above: it is the clearest instance in this Part of an intense, deliberately modulating emission presented at close range to the population Part IX.L asks be addressed expressly, by a public entity, under a federal standard that sets a floor and no ceiling. Part IX.C for the measurement and Part IX.I for the instrument.

D. Roadway, Area, and Parking Lighting

This product class differs from the others in this Part in who chooses it. A householder selects a lamp, a motorist selects a vehicle, and an employer selects the lighting of a workplace. Roadway, area and parking lighting is selected by a public authority or a property owner, installed in the public realm, and directed at people who were not consulted and cannot switch it off. Part II.H.3 records that the Foundation does not ask this Department to assume the authority of States and municipalities over lighting design, and nothing in this subsection does. What this subsection addresses is the quantity of radiation those installations emit, and the basis on which that quantity was chosen.

What the products are

Overhead luminaires on poles along carriageways and footways; the same on parking lots, forecourts and campuses; floodlighting of yards and building exteriors; and the light-emitting diode retrofits that have replaced the high-pressure sodium and mercury vapor sources in most of them over the last fifteen years. The change of source is the reason this subsection is necessary. The review described below records what the replacement altered: the earlier sources offered limited choice of

spectral power distribution, were physically large and so gave limited optical control, and took minutes to reach output. Diode sources remove all three constraints, giving fine optical control, near-arbitrary control of spectrum and instantaneous switching.

Who is exposed, and under what conditions

Everyone outdoors after dark, and many people indoors. Drivers and passengers; pedestrians and cyclists; residents whose windows face a luminaire; people whose work is conducted under it. The exposure is nocturnal, it is chronic, it continues for the whole of the dark period, and unlike every other class in this Part the exposed person has no control over it whatever. Part V.G treats the circadian consequences of nocturnal exposure and Part V.C the visual ones. This subsection concerns the quantity.

Which body sets the quantity, and what the test is

No federal standard does. The quantities are set by consensus recommendations of standards bodies and adopted by reference in State and municipal practice: in the United States the Recommended Practice on Roadway Lighting of the Illuminating Engineering Society, and internationally the publications of the Commission Internationale de l'Eclairage and the European EN 13201 series. The test is photometric: an average illuminance in lux or an average road surface luminance in candelas per square meter, with uniformity ratios, for a lighting class selected from a table.

The review the Foundation relies on, and what it concludes

Fotios S. and Gibbons R., Road lighting research for drivers and pedestrians: The basis of luminance and illuminance recommendations, Lighting Research and Technology, volume 50, number 1 (2018), described at Appendix C.110. The first author is at the University of Sheffield and the second at the Virginia Polytechnic Institute, and the second has performed much of the American research in this field under Federal Highway Administration sponsorship. It is a review of where the recommended light levels came from. Its conclusion is stated in its abstract:

> "Recommendations for the amount of light do not appear to be well-founded in robust empirical evidence, or at least do not tend to reveal the nature of any evidence."

And at the end, more plainly: "While there appears to be little, if any, credible empirical support for light levels recommended in much current road lighting guidance, data are emerging that will allow standards to be better informed by empirical evidence."

What the American recommendation rests on

The authors trace it to a single study. The recommendations of the Illuminating Engineering Society, which they describe as originally implemented in 1972 and "still the basis of current standards in North America", derive from work by Box published in 1971 on the relation between illuminance and crashes along 203 miles of freeway.

What that study found is not what the standard implies. The authors report that "Box concluded that roads with the lower range of illuminances (0.3 to 0.6 horizontal foot candles (HFC), or 3.2 lux to 6.4 lux) had a lower night/day crash ratio than roads with a higher range of illuminances", and that he recommended the lower figure of 0.5 foot-candles accordingly. They then state the obvious difficulty and the explanation for it:

> "This result seems counter to intuition as a higher lighting level increased the crash rate ratio. It must be remembered that additional lighting can create additional glare and impacts the driver's adaptation level so while this result is not expected, it may be justifiable."

The Foundation asks the Department to read that against Part VI.B.1. The two mechanisms the authors invoke to explain why more light was associated with more crashes are glare and the driver's adaptation level. Those are the two quantities measured in 1989 by the vehicle research institute described at Appendix C.109, and the second is the one an oncoming headlamp raises by three log

units. The explanation offered for an anomaly in the roadway lighting literature is the mechanism established in the headlamp literature.

The authors then record two limitations that govern what the American standard can claim. The first is internal to the data: the six-lane road results do not exhibit a relationship between light level and crash rate at all, the linear fit returning a coefficient of determination of 0.02. The second is the one that matters most here: "these values were applied only to freeways; the levels for other roadway categories had no empirical backing. Despite these limitations, the 0.5 foot candle illuminance determined by Box has been carried through the standards and translated into luminance criterion."

So the quantity of optical radiation directed at people on American residential streets, in parking lots and along footways derives, through a chain of consensus documents, from a figure established for limited-access highways in 1971 and extended to every other category of road without, in the words of the authors reviewing it, empirical backing.

What the international recommendations rest on

The authors find the same absence and say so three times. Of the earliest British standard, whose minimum illuminances ranged from 0.1 to 21.5 lux, they record that those minima "were not intended to be considered as a figure of merit for the installation but only as a rating of its size and had no theoretical basis". Of the modern pedestrian classes: "the empirical evidence for these recommendations, if any, is unknown", and "there is no published explanation of the basis for these values". Of the facial recognition criteria, where the ratios between horizontal, vertical and semi-cylindrical illuminance are suspiciously round: "There are no known reasons for these criteria and the consistent ratios suggest they were not independently evaluated but are simply an arbitrary ratio."

And on the apparent agreement between the international and European documents, which a reader might take for corroboration, the authors supply the reason it is not. The similarity "is unsurprising since 'many of the members on the CIE committee are also members of the CEN committee', which is not the same as independent groups reaching similar conclusions". The Foundation records that observation because it bears wherever this comment meets a consensus document, and Part V.D.3 and Appendix D.2 contain several.

Why the levels rose

The authors address the trend directly, and their explanation is the one this comment has given for a different product class. Recommended maxima for subsidiary roads in the United Kingdom rose from 10 lux in 1992 to 15 lux in 2003, and measured average street lighting illuminance in Britain has tended to rise over time. The reason they give:

> "Changes in technology have moved towards lamps of greater efficacy and light levels may have increased, because there was an ability to do so, not because there was evidence of a benefit to be gained from higher light levels."

Part VI.B.1 reports that the luminous intensity of vehicle low beams rose by about a third in the decade to 2025. Here is the same movement in the fixed lighting of the same roads, given the same explanation by the people who review the standards: the emission rose because the technology permitted it.

The authors' own prescription, which is what this comment asks for

Two passages of this review ask for what the Foundation asks this Department for. The first adopts a framing the Department will recognize. Reporting the position of Lucas and colleagues, the authors write that the management and use of light is "similar to administering a drug: light has both benefits (positives) and unwanted side-effects (negatives) giving the need to control the dosage of the light so as to provide the maximum benefit whilst minimising the negatives".

The second states what they think the standards must come to contain:

> "The average illuminances and uniformity of current standards may no longer be sufficient and future standards may need to include maximum light levels, limitations for SPD and spatial distribution and exposure doses."

Maximum light levels. Limits on spectral power distribution. Exposure doses. Those are the three things this comment has asked the Department to consider for every product class in this Part, and they are proposed here by two researchers in the field, in the journal of the discipline, as what lighting standards will need. The Foundation observes that the third is not a concept the lighting standards possess. A dose is a quantity received by a person over time, which is the subject matter of paragraph 360ii(a)(4) and the organizing idea of this Department's radiation program.

One further finding, on the metric itself

The authors note that road lighting is specified in photopic quantities while the conditions under which it is used are mesopic, so that the recommended values are "derived from the CIE standard photopic observer and hence ignore any contribution from the rods (and short wavelength sensitive cones)". They add that the limitation "has become more important since the widespread introduction of LEDs", because diode sources make the spectrum adjustable. That is the proposition at Part V.B.3, reached from the direction of roadway practice: the photometric quantity in which the installation is specified does not describe the spectral content of what it emits.

What this review does not establish

It is a review and reports no original experiment. It is about visibility, safety and reassurance, and it contains no health endpoint: the side effects it names are energy, sky glow, light trespass and effects on the natural environment, and it treats the human consequences as matters of seeing rather than of biology. It does not assert that any light level causes any injury, and the Foundation does not cite it for any such proposition.

Its authors declare no conflict of interest. One of them discloses that much of the research he refers to was supported by government agencies including the Federal Highway Administration, by local agencies, and by "lighting companies and other interested parties". The Foundation records the disclosure and notes that the review's findings are adverse to the commercial interest of the last of those categories.

What the Foundation asks

That the Department notice three things about this product class. That the quantity of optical radiation emitted into the public realm at night is set by consensus recommendations which, on the assessment of two researchers who review them, have little if any credible empirical support. That the American figure at the root of those recommendations was derived for freeways in 1971 from data showing higher illuminance associated with a higher crash ratio, and extended to other road categories without empirical backing. And that the researchers who report this propose, as the remedy, maximum light levels, limits on spectral power distribution, and exposure doses, which are quantities within the subject matter of section 360ii and within no other federal authority the Foundation has been able to identify.

E. Interior Lighting in Schools, Workplaces, and Healthcare Settings

The settings in this subsection share a feature that distinguishes them from every other interior treated in this Part. The people exposed are present by requirement rather than by choice, for the longest continuous periods of any indoor setting, and in the case of the largest affected population they are children attending school under compulsion of State law.

1. What the products are

The dominant product is the recessed ceiling luminaire: the two-foot by four-foot and two-foot by two-foot troffer and its flat-panel successor, installed on a grid at a spacing and mounting height determined by a design illuminance. In American classrooms these were fluorescent for roughly four decades and are now predominantly light-emitting diode, either as complete replacement luminaires or as tube retrofits installed in the existing housings.

The retrofit pattern matters and the Foundation identifies it because it bears on what was evaluated. A tube retrofit changes the emitter, the spectral power distribution, the source luminance and the driver, while leaving the layout, the mounting height, the spacing and the design illuminance as they were. The design was not reconsidered. One component inside it was exchanged for another with different emission characteristics, and the quantity held constant across the exchange was illuminance in lux, which Part V.B.3 establishes is silent as to spectral composition and Part V.B.2 establishes is silent as to source luminance.

Three further classes are present in these settings. Linear suspended and surface-mounted luminaires, in corridors, gymnasia and newer construction. Task and accent lighting at reading tables and nurse stations. And displays: the interactive whiteboard and the projector, now standard in American classrooms, which are self-luminous surfaces at a viewing distance of a few meters and are treated as a product class at Part VI.H. In healthcare settings the class also includes examination lighting, overbed lighting and continuous corridor lighting.

2. Who is exposed, and under what conditions

Three populations, and the first of them is the reason this subsection exists.

Children are exposed for approximately six hours a day, on the order of 180 days a year, for thirteen years, under a luminous condition they did not choose, in a room they cannot leave, under a legal obligation to attend. The Foundation is not aware of any other exposure to an electronic product in American life that combines that duration, that involuntariness and that population.

That conjunction compounds with a fact established earlier in this comment, and the Foundation asks the Department to hold the two together. Part V.C.2.g sets out the age-resolved ocular transmittance figures stated by a European scientific committee: about 65 percent of light at 460 to 480 nanometers reaches the retina in children under nine years of age, against about 40 percent in adults aged 60 to 70. The population with the longest compulsory exposure to interior lighting is also the population whose crystalline lens filters the least of the short-wavelength content of that lighting.

Teachers and school staff are exposed occupationally, for the duration of a working day, across a career. Part II.H.10 and Part VI.F describe the occupational dimension and the consultation that § 360ii(a)(6) directs.

In healthcare settings the exposed population includes patients, some of them for extended inpatient stays, some of them supine and unable to avert the gaze or move away from an overhead source, and some of them in conditions that bear on photosensitivity. Part V.E. It also includes staff working night shifts, which is the exposure for which the International Agency for Research on Cancer has made the classification described at Part II.E.6.

3. What has been measured, and by whom

The largest American study of classroom lighting against a measured human outcome is not a federal study, is not a health study, and was not commissioned by any body with authority over emission. It was commissioned by an electric utility under a State energy-efficiency program. The Foundation sets it out at some length, both for what it found and for what it could not do.

The Heschong Mahone Group reported Daylighting in Schools: An Investigation into the Relationship Between Daylighting and Human Performance on August 20, 1999, for Pacific Gas and Electric Company on behalf of the California Board for Energy Efficiency Third Party Program, under contract 460 000 8215. Appendix D.4. The study covered more than 21,000 students in grades two through five and more than 2,000 classrooms, in Capistrano Unified in Orange County, Seattle Public Schools and the Poudre School District in Fort Collins. Classrooms were coded for window area and tint, for skylight presence and type, and for overall expected daylight, and the codes were regressed against standardized test performance.

Its reported headline associations are large. In the Capistrano district, where each student served as their own control because fall-to-spring score change was used, classrooms with the most daylight were associated with 26 percent faster reading progress and 20 percent faster progress in mathematics than those with the least. Across the three districts the report gives a range of 7 to 18 percent.

Why the Foundation does not rely on those figures

The Foundation states its reasons, because a comment that quoted a 26 percent figure from a 1999 consultancy report as though it were settled would deserve to be discounted entirely, and because this comment holds other parties to the same standard.

The study is correlational and says so. Its authors state that it cannot prove the cause for an effect.

Its authors describe their proposed mechanisms as informed guesses, and the Foundation notes that the executive summary speaks more strongly than the body of the report supports.

The same firm returned to the question for the California Energy Commission in work reported as Windows and Classrooms, which examined student performance against a wider set of indoor environmental variables. No figure from the 1999 report should be quoted in this comment until that later work has been read and its effect on these estimates stated.

The finding the Foundation does rely on, which points the other way

One result in the 1999 study is adverse to its own thesis, and it is the result this comment uses.

Classrooms with one particular skylight configuration, designated Type B in the report and described as clear acrylic, uncontrolled and mounted in a corner, were associated with 21 percent lower reading progress, with no significant effect in mathematics. The authors attribute the result to glare: direct sunlight splashing onto walls and desks. In the Fort Collins district the south-facing roof monitors were described as very bright, and the report records that the investigators did not learn the extent of the glare problems until after the analysis was complete.

The Foundation asks the Department to weigh what that is. It is a quantified association between a luminous condition that produces glare and a degraded, objectively measured performance outcome, in a population of American schoolchildren, produced by a study that was not designed to look for it and whose sponsor had no interest in finding it. More daylight was not uniformly better. The configuration that admitted light without controlling it was associated with worse performance than the configuration that admitted less.

That bears directly on Part V.D, which treats discomfort glare, and on the proposition this comment makes throughout: that the quantity of light delivered is not the measure of its effect, and that how it is delivered – from what apparent source size, at what luminance, in what part of the visual field – governs the outcome. A skylight and a diode luminaire are different products, and the Foundation does not equate them. The mechanism of a high-luminance source in the field of view of a seated child is the same in both.

What the study could not do, and why that is the more important point

Two of the report's own limitations are characterization failures, and they are the same two failures this comment identifies in the present record.

The first is spectral. The authors hypothesized color rendition as a mechanism, on the ground that daylight has a continuous spectrum while electric sources are uneven, and they could not test it. No spectral measurement of the classrooms was available to them.

The second is more basic. In Capistrano, the district whose design was strongest and whose results are most often quoted, the type of electric lighting equipment installed was unavailable to the investigators, so electric lighting could not be analyzed at all. In Fort Collins electric lighting was excluded from the analysis for the same practical reason.

So the largest American study of lighting and childhood performance was unable to say what the electric lighting in the rooms was, or what any of the light in the rooms was spectrally composed of. Twenty-seven years later, neither datum is available for American classrooms. Part IX.H asks for the second of them. Paragraph 360ii(a)(4) directs the Secretary to study and evaluate emissions of, and conditions of exposure to, electronic product radiation, and a classroom is a condition of exposure.

4. What federal requirement governs the optical output

As with every other class in this Part, the Foundation can identify none.

The Department of Energy regulates lamp efficacy in lumens per watt, and Part IV.G establishes that efficacy is silent as to what the selected technology emits. No federal requirement addresses the spectral power distribution, the source luminance, or the temporal modulation of a luminaire installed in a classroom. Part 1040 of title 21 prescribes a performance standard for no product in this class.

What exists is voluntary and non-federal, and it is addressed to task visibility rather than to biological effect. The Illuminating Engineering Society publishes recommended illuminance for educational facilities. State school facility standards and construction codes address illuminance, and in some States daylighting, as design criteria. None of them states a limit on what a luminaire may emit at a given wavelength, and none was set by a body with a health mandate.

The Foundation notes one consequence specific to this setting. Where a school district specifies lighting, it specifies it by illuminance, efficacy, correlated color temperature and cost. Those are the quantities available on the product literature, as Part II.H.13 describes. A district that wished to specify by source luminance or by short-wavelength content could not, because the information is not published. Part IX.F.

5. What the Foundation asks as to this class

That the luminous environment of representative American classrooms be measured as children actually encounter it: at the seated eye height of a child rather than at the work plane, in the directions a child actually looks, including toward the ceiling luminaires and the interactive display, and reported in spectrally resolved radiometric terms and in source luminance rather than in illuminance alone. Part IX.H.

That the spectral power distribution and source luminance of the luminaires and tube retrofits actually installed in American schools be characterized – the measurement the 1999 study could not obtain and that no federal body has obtained since.

That exposure be evaluated over the duration it actually occurs: the school day, the school year, and the thirteen years of compulsory attendance, rather than the single episode of under three hours for which the only existing exposure limit was constructed. Part V.C.2.c.

That the occupational exposure of teachers, school staff and healthcare workers be evaluated in consultation with the Secretary of Labor under § 360ii(a)(6) and with the National Institute for Occupational Safety and Health, which is a component of this Department.

That this setting be included expressly in the research and evaluation directed by § 360ii(a)(2) and (a)(4), and that the conjunction described at subsection 2 – longest compulsory exposure, least lenticular filtering, no capacity to consent or avoid – be addressed in the treatment of sensitive populations requested at Part IX.L.

F. Retail and Commercial Interior Lighting

The product class treated in this subsection is the luminaire, not the store. That distinction does real work here, and the Foundation states it at the outset rather than at the end.

1. What the products are

A large-format retail interior — a supermarket, a warehouse club, a general merchandise store — assembles several distinct classes of light-emitting diode product in one enclosed volume: recessed and surface-mounted troffers, continuous linear strips, high-bay and low-bay fixtures, track-mounted accent heads, refrigerated-case lighting, backlit and edge-lit signage and menu boards, and illuminated shelf, cooler-door and endcap displays. Each is an electronic product within 21 U.S.C. § 360hh(2) and each emits electronic product radiation within § 360hh(1)(A). Part II.B.

2. Who is exposed, and under what conditions

Two populations are exposed, and they differ in a way the statute treats as significant.

Customers are exposed episodically, for periods ordinarily measured in minutes to an hour. The exposure is not avoidable in the ordinary sense of that word, because these premises are where food, medicine and household necessities are obtained. The courses open to a person who cannot tolerate the environment are to send someone else, to use delivery where it is available and affordable, or to do without.

Employees are exposed for the duration of a shift, on a schedule not of their choosing, in a luminous environment they did not design and cannot alter. This is occupational exposure to electronic product radiation. Paragraph 360ii(a)(6) names the Secretary of Labor among the officers with whom the Secretary is directed to consult and maintain liaison, and Part II.H addresses that paragraph.

3. The characteristics that distinguish this setting

Four characteristics distinguish the retail interior from the other settings treated in this Part, and they compound rather than simply add.

The first is emitter count. The sources are present in the hundreds, and in the largest formats above that. Part V.D addresses the general problem that the published literature characteristically exposes a subject to one source while real exposure is to many; this is the setting in which the gap between the two is widest.

The second is directionality. Retail luminaires are frequently aimed. Accent heads, case lighting and shelf lighting are directed at merchandise rather than at a horizontal work plane, so a person moving through the space traverses a field of sources whose angular relationship to the line of sight changes continuously. Disability glare is a function of that angle, and Part V.C.3 sets out why.

The third is the one that separates this setting from every other interior, and the Foundation asks the Department to attend to it particularly. In an office, a classroom or a healthcare interior the design aim is uniformity, and recommended practice limits luminance ratios within the field of

view for that reason. In a retail interior the aim is the opposite. Contrast between accent and ambient illumination is used deliberately, to draw the eye to merchandise, and the recommended practice for retail contemplates luminance ratios well above those recommended for task environments. The variable that produces discomfort glare is, in this setting, the variable the design is optimizing for.

The Foundation does not offer that as an accusation. It is a description of a design objective that was settled when the available sources were physically large, diffuse and low in luminance, and that has been carried over without reexamination to sources that are small, intense and spectrally narrow. Part V.B.2 describes the change in source geometry. The objective is the same; the means of achieving it is not.

The fourth is spectral distribution. The correlated color temperatures selected for merchandise presentation, and the short-wavelength peak characteristic of phosphor-converted white LEDs, are addressed at Part V.B.1 and Part V.B.3.

4. What federal requirement governs the optical output

As to the optical output of these products, the Foundation can identify none. The Department of Energy regulates lamp efficacy in lumens per watt, as Part IV.G describes, and efficacy is silent as to what the selected technology emits. No federal requirement addresses source luminance, spectral power distribution, temporal modulation or glare in a retail interior. As to employees, 29 C.F.R. § 1926.56 prescribes minimum illumination intensities for construction work; the Foundation is aware of no federal standard prescribing a maximum luminance, a spectral characteristic or a glare limit for general industry.

What exists is voluntary and is not addressed to biological effect: recommended practice published by the Illuminating Engineering Society for retail spaces, model energy codes that regulate installed power density rather than optical character, and the photometric reporting that manufacturers choose to publish.

5. The limit of this Department's authority, stated plainly

The Foundation is sometimes asked why it does not simply request that the Food and Drug Administration regulate the lighting in a store. The answer is that the authority of this chapter does not reach that far, and the Foundation does not claim that it does. Performance standards under § 360kk are prescribed for electronic products and run against manufacturers; § 360oo prohibits the introduction of non-conforming products into commerce. A retailer that buys conforming luminaires and installs them is not a manufacturer, and a store is not an electronic product. Nothing in this chapter authorizes the Secretary to determine how many fixtures a business may install, how it may aim them, or how bright its interior may be.

Two things the chapter does reach, and together they are sufficient to make this product class the Department's concern.

The first is the product. The characteristics that make the aggregate environment what it is are characteristics of individual luminaires as manufactured and sold: the radiance of the emitting surface, the spectral power distribution, the presence or absence of diffusion, the beam distribution, and the temporal modulation imposed by the driver. Every one of them is fixed before the product reaches the purchaser. A standard addressed to those characteristics would change the installed environment without regulating any installation.

The second is the exposure. Section 360ii(a)(4) directs the Secretary to study and evaluate not only emissions but "conditions of exposure to" electronic product radiation. That phrase is what reaches the installed environment. A retail interior is a condition of exposure, and evaluating it requires no authority over the retailer whatever. Section 360ii(a)(2) runs the same way: it directs the minimization of "the exposure of people to" unnecessary electronic product radiation, and not merely the emission of it. Part II.D.

6. What the Foundation asks as to this class

That the luminous environment of representative large-format retail interiors be measured as it is encountered — at eye height, in the directions a person actually looks, and in terms of luminance and spectral content rather than illuminance at a work plane. Part IX.C.

That employee exposure across a full shift be evaluated, in consultation with the Secretary of Labor under § 360ii(a)(6) and with the National Institute for Occupational Safety and Health. Part II.H.

That the emission characteristics of individual luminaires be disclosed, so that a purchaser, an employer or an occupational health professional can ascertain them before installation. Part IX.F.

That this exposure setting be included in the research and evaluation directed by § 360ii(a)(2) and (a)(4), which at present it is not.

G. Consumer Lamps, Fixtures, and Household Products

This subsection concerns the light-emitting diodes a person lives with: the lamps in fixtures, and the indicators on appliances, tools, chargers, outlets, alarms, routers, televisions, furniture and the rest of what occupies a modern household. Subsection 1 names the class in full, because its breadth is not apparent from a summary and because almost nothing in it is a lighting product. The Foundation treats the indicator at length and the lamp briefly, which is the reverse of the attention these receive elsewhere, for a reason it states at the outset. The lamp is at least nominally within a framework. The indicator is, on the account at Part V.C.2.k, typically not evaluated at all.

1. The products this subsection reaches, and the code the Center has already assigned them

The Foundation sets the class out by naming it, because the breadth is the first thing to understand about it and a general phrase does not convey it. The products in this subsection include: lamps in fixtures and the fixtures themselves; and the indicator, status and annunciator lamps fitted to kitchen and laundry appliances, including ovens, ranges, refrigerators, dishwashers, washing machines and dryers; to cordless and corded power tools, battery chargers, air compressors and portable generators; to wireless routers, modems, network switches and televisions; to wall outlets, switches, surge protectors and power strips; to smoke alarms and to carbon monoxide and carbon dioxide alarms; to thermostats, door locks, doorbells and cameras; and to furniture with electrical functions, including powered recliners and adjustable beds. It also includes seasonal and decorative light strings and the backlighting behind a display panel.

This Department has classified that class. Product code RIQ, reproduced at Appendix F.1.20, is defined by the Center as:

> Finished LED products intended to act as an indicator or for decorative purposes, such as Christmas tree lights or display backlighting. LED product only intending to emit visible radiation at low intensities.

The entry records, against the field for applicable performance standards, that no standard applies and that the general radiological health requirements of parts 1000 to 1005 do. So the position for this class is the position Part IX.A describes for the illumination lamp: the product is classified, its emission is recorded as optical, the general requirements are stated to apply, and nothing limits what it may emit.

Two features of that definition do the work of this subsection, and the Foundation separates them because they fail in different ways.

The first is the word low. The class is confined to products intending to emit visible radiation at low intensities, and low is nowhere defined. Subsection 2 sets two indicator components of identical physical size beside each other and finds a difference of between about two hundred and

twenty and four hundred and twenty times in luminous intensity. Both are within this class as it is drawn. A classification whose boundary is an undefined adjective cannot exclude anything, and the Foundation does not ask for the adjective to be defined; it asks for the limit sought at Part IX.I, which is a different thing and is what an undefined boundary actually calls for.

The second is the word intended, and it is the more interesting of the two. The class turns on what the product is intended to do, and for a great many of the products named above the intention is to be noticed. A status lamp exists in order to be seen across a room, in daylight, by somebody who is not looking for it. On a smoke alarm or a carbon monoxide alarm the indicator is part of a safety function, and a manufacturer with reason to make it conspicuous has every reason to make it bright. That is a design pressure toward higher intensity operating inside a classification premised on low intensity, and no instrument reconciles the two. The Foundation does not suggest that annunciators should be made less visible. It observes that the brightness of an indicator is determined by what it has to do, that what it has to do is often a safety requirement, and that nothing anywhere establishes a ceiling at which conspicuity has been achieved and further intensity is unnecessary radiation within the meaning of paragraph 360ii(a)(2).

One further characteristic of this class distinguishes it from every other in this Part, and the Foundation states it plainly because it is the reason the class matters at all. The exposure cannot be avoided without giving up the function. A person who finds a streetlight intolerable can draw a curtain, and Part VII records that many have. A person who finds the indicator on a smoke alarm intolerable cannot cover it without defeating the alarm, cannot unplug it, and in a rented dwelling cannot replace it. The same is true of a carbon monoxide alarm, of a thermostat, and of a wall outlet. Subsection 2 describes the exposure; this is what makes it different from a lamp.

2. The indicator, and the characteristic nobody can obtain

An indicator is a single small emitter whose purpose is to be looked at. It is encountered at short range, frequently in a dark room, and often by someone who did not choose to encounter it and cannot switch it off without disabling the appliance. The Foundation offers no estimate of how many are present in an American dwelling and does not need one; the relevant fact is what is known about any particular one of them.

The governing characteristic is the beam angle, because it determines both how concentrated the emission is and whether the optical treatment described at Part V.C.2.k applies. The industry specifies it as the full angle between the directions at which luminous intensity falls to half its value on the optical axis, written 2θ-one-half and defined on the component data sheets in those terms. The Foundation examined two ordinary five-millimeter indicator components:

A diffused red device, gallium aluminum arsenide, peak wavelength 660 nanometers, luminous intensity 36 millicandela minimum and 80 typical at 20 milliamperes, specified at a full viewing angle of 110 degrees. The half angle is therefore 55 degrees and the emission occupies about 2.68 steradians.

A water-clear yellow device of the same five-millimeter package, luminous intensity 15,000 to 20,000 millicandela at the same 20 milliamperes, specified at a full viewing angle of 15 degrees. The half angle is therefore 7.5 degrees and the emission occupies about 0.054 steradian.

Two components of identical size, fitted behind identical panel apertures, differing by a factor of about 50 in the solid angle into which they emit and by between about 220 and 420 in luminous intensity depending on whether typical or minimum figures are compared. The two choices travel together, because the clear lens is what produces both. And the second device has a half-power angle of 7.5 degrees, which places it inside the range in which the partial-coherence analysis at Part V.C.2.k is valid and in which treating the source as fully incoherent understates what reaches the observer.

None of that is disclosed to anyone who meets the appliance. The figure exists: it is on the component manufacturer's data sheet, it is known to the appliance maker who specified the part, and it is a routine parameter of the trade. It does not appear on the appliance, in its manual, on its energy label, or in any filing made in respect of it. A person who wakes at night in a room containing the device cannot obtain it. A physician asked about that person cannot obtain it. A public entity conducting the self-evaluation described at Part VIII cannot obtain it. The number is not unknown. It is known one tier up the supply chain and is not carried forward, because no instrument requires that any emission characteristic of a visible-light diode product be disclosed to anybody. Part IX.F.

The Foundation asks the Department to notice the shape of that, because it recurs throughout this comment and is clearest here. The difficulty is not that the emission characteristics of these products are hard to measure. They are measured, by the people who make the components, as a condition of selling them to the people who make the appliances. The difficulty is that the measurement stops at the boundary of a commercial transaction and is required to go no further.

3. The lamp

General service lamps and the fixtures that hold them are the product class through which most Americans encounter diode lighting, and the Foundation treats them here only to record what is and is not fixed about them. Within the photobiological framework a general lighting service lamp is assessed at the distance producing 500 lux, which Part V.C.2.k describes. There is no federal limit on the luminance of the emitting surface, on the spectral power distribution, or on the temporal modulation of any of them, and Part V.B.1 records that the spectral output of a phosphor-converted lamp shifts toward the short wavelengths as the phosphor degrades over the product's life, so that a measurement made at manufacture does not describe the lamp in service.

4. What the Foundation asks as to this class

Four things, none of which requires a finding this record cannot support. That the Department confirm, as Part IX.A asks generally, that a product classified under RIQ is within the scope of its authority. That the disclosure sought at Part IX.F reach this class, so that the beam angle and the luminous intensity which exist on the component data sheet are carried forward to the person who meets the appliance; subsection 2 sets out that the figure is known one tier up the supply chain and is required to go no further. That the research at Part IX.C include the exposure geometry specific to this class, which is a small high-radiance source at short range in a dark-adapted eye, and which differs from every other class in this Part in that the exposed person cannot end it without disabling a function they rely on. And that any classification system developed under Part IX.G not rest on an undefined adjective, the defect subsection 1 identifies in the present class.

H. Displays, Screens, and Personal Devices

What the products are

Self-luminous screens. Televisions and monitors, tablets and telephones, the interactive whiteboard and the projector now standard in American classrooms, the display fitted in a vehicle dashboard, and the screens on payment terminals, kiosks and self-service equipment. Part VI.S treats the decorative lighting applied to equipment of that last kind and Part VI.T the lighting on mobile devices; what distinguishes this class from both is that the surface is conveying information rather than signaling presence.

What makes this class different from every other in this Part

Two things, and the second is not addressed anywhere in the regulatory apparatus.

The number of emitters. In every other class the emitters in the field of view can be counted: one headlamp, two beacons, a row of luminaires. In a display they number in the millions per device, each individually driven. Part III.D.8 treats the number of emitters during exposure as a

characteristic requiring a boundary, and Question 15 of the notice raises it. A criterion written for a countable number of point sources does not describe this class.

Modulation per color channel. Part III.E.1 and Part III.E.2 treat temporal characteristics and rise and decay times, and Part V.D treats temporal light modulation. None of those quantities is computed per wavelength channel. A display can present a surface of constant total luminance while modulating strongly in color, because the channels modulate against one another, and a criterion expressed in the usual temporal quantities would not reach it. Part VI.K treats the entertainment class in which color-changing programming is the deliberate point of the product. The Foundation identifies the gap and does not assert that any effect follows from it: it states that the quantity is not measured and that no criterion describes it.

Who is exposed, and under what conditions

Nearly everyone, at close range, for hours daily. The conditions divide sharply and the Foundation keeps the halves apart because its request differs between them. A person using their own telephone or monitor chooses the device, controls its brightness, and can put it down. A child in a classroom facing an interactive whiteboard does none of those things, and Part VI.E.1 treats that setting. Nor does a driver facing a dashboard display, a worker facing a monitor for a shift, which Part V.H treats, or a person obliged to use a payment terminal to complete a transaction. Part VII.F records accounts of people ceasing to enter places for reasons of lighting, and Part VI.S records that the nearest account in this record to that class concerns the screen of a tabletop payment terminal in a restaurant, which belongs here.

Which agency asserts jurisdiction, and what this Department has already done

This Department has classified these products. Appendix F records three display codes in the Center's classification of radiation-emitting electronic products, and the Foundation asks the Department to read the definition of one of them. It turns on the presence of a high intensity light source, and the term high is nowhere defined in the classification. So the Department's own operational record contains a category of product distinguished by the intensity of its source, with no statement anywhere of what intensity qualifies. Part II.B.6 sets out what a product code is and is not, and the Foundation does not treat the code as a rule.

No performance standard under § 360kk applies to the visible light these products emit, and Part VIII.D.1 establishes that generally. No other federal body limits it either: the radiofrequency emissions of a display are within the Federal Communications Commission's rules and its energy consumption is within the efficiency framework Part IV.G describes, and neither reaches what the screen emits toward the person looking at it.

What the Foundation asks as to this class, and what it does not

It does not ask for a limit on the screen of a device its user chooses, holds and controls, and it says so plainly because the opposite request is the one that would be assumed. A person who can dim their own telephone is not the subject of this comment.

What it asks is three things. That the characterization at Part IX.C reach this class, and specifically that it resolve modulation per color channel rather than integrating it away, which Part IX.C.3 sets out. That the definition of the display code turning on a high intensity light source be given a value, since the Department has already drawn the distinction and has not said where it falls. And that disclosure under Part IX.F reach the settings in which the exposed person does not control the device, which are the classroom, the vehicle, the workplace and the terminal a transaction requires.

I. Security and Deterrent Lighting Systems

This class is the newest in this Part and the only one for which the Foundation has a complete independent measurement of an actual product in actual use. The Foundation therefore sets the subsection out differently from the others. It describes the class briefly, gives the measurements,

and then does the one thing this comment is otherwise never able to do: it sets measured values for a product on an American street against every published criterion the Foundation has been able to find, and reports what happens.

1. What the products are

Self-contained units installed on private property and directed at the space around them, combining cameras with high-intensity light-emitting diode sources operated in a strobing mode. They are marketed for deterrence and surveillance rather than for illumination, and that distinction is central to everything below. A luminaire is designed to put light on a surface so that a person can see. These products are designed to be looked at, and to be unpleasant to look at. The aversiveness is the function.

They are mounted on trailers or masts, moved between sites, and operated unattended. They are not street lighting, they are not vehicle lamps, and they are not signs. No federal instrument addresses them, and the Foundation has found no product class in 21 C.F.R. part 1040 into which they fall.

2. Who is exposed, and under what conditions

The population is everyone within line of sight, which in the surveyed installations includes a public sidewalk, a parking lot entrance in continuous use, and a roadway. Exposure is involuntary in the strict sense: the person has not sought the source out, cannot negotiate with its operator, and in the cases described below encounters it while walking on a public way or driving on a public road. It occurs at night, against a dark-adapted eye, which is the condition under which every mechanism treated in Part V is at its most consequential and under which, as Part V.D.1 establishes, the instruments built to measure modulation are least able to operate.

3. The product that has been measured, and how the measurement came to exist

The Foundation commissioned an independent measurement report on these units, described at Part IV.E.3 and listed at Appendix D.4. It was prepared by Ken Walczak of Night/Light Consulting, LLC, a board member of DarkSky International and a member of the Illuminating Engineering Society, and is dated 10 September 2026. The lamp characterized is an Abrams Manufacturing TG-300-B, measured in the laboratory on a purchased unit and observed in service at three sites in Chicago and one in Woodland, California.

The Foundation states its own position in the document plainly. It commissioned the report and paid for it. It did so because no federal measurement convention existed to which a complaint could refer, and because no federal body measures these products. The Department should weigh the report accordingly, and the Foundation asks it to notice the fact the commissioning discloses: the only photometric characterization of this product class known to the Foundation exists because a private party paid a consultant to make it.

4. The measurements

The values below are taken from the report. Those marked as laboratory values were obtained on a purchased lamp powered at 12 volts direct current from a calibrated supply and stabilized for at least five minutes, with the lamp in its steady setting.

Luminance in the direction of the central peak of emission: 700,000 candelas per square meter.

Total emission area of the three light-emitting diodes in the unit: 10.4 square centimeters, from which the report derives an average peak luminous intensity of 728 candelas.

Illuminance at one meter, photopic corrected, at the center of the emission peak: 145 lux.

Spectrum: peak emission at 456 nanometers, with more than 80 percent of the emitted light in the blue part of the spectrum. The report summary gives the blue content as 81.5 percent.

Flicker, which the report attributes to pulse-width modulation in the driver: frequency 100.1 hertz, flicker percentage 63.9, flicker index 0.24, cycle 10.0 milliseconds.

Strobing, which the report distinguishes from flicker as a designed function rather than a residual fluctuation: frequency 20.9 hertz, modulation 77.4 percent, flicker index 0.385, cycle 47.85 milliseconds.

The lamp offers fifteen flash patterns. The pattern observed in use at every surveyed unit was the default, which the report identifies as P9 Quint 75 PH1: five pulses at about 20 hertz followed by a gap of 0.2 seconds, the whole repeating more than twice a second, with the first four pulses lasting about 50 milliseconds and the fifth about 200 milliseconds.

5. The measurements set against IEEE Std 1789-2015

Appendix D.2 describes that document and states what it is: a recommended practice of a professional body, which imposes no obligation on any manufacturer and with which no federal regulation requires compliance. The comparisons below are therefore comparisons with a voluntary criterion, and the Foundation makes them because it is the only quantitative criterion in existence for the quantity measured. The report itself describes the results as violations of that document. The Foundation does not adopt that word. Nothing is violated, because nothing was required.

The arithmetic is the Foundation's, from the recommended practices as published at clause 8.1.1 and the measured values above.

The strobe, at 20.9 hertz and 77.4 percent modulation, is below the 90 hertz boundary, where all three recommended practices apply. Recommended Practice 1, for limiting possible adverse biological effects, permits modulation below 0.025 times the frequency, which is 0.52 percent. The measured value is about 148 times that. Recommended Practice 2, the no-observable-effect level, permits 0.01 times the frequency, or 0.209 percent, which the measured value exceeds by a factor of about 370. Recommended Practice 3 is the seizure-prevention practice and is stated differently from the other two:

> "Recommended Practice 3: (seizure prevention) For any lighting source, under all operating scenarios, flicker Modulation (%) shall satisfy the following goal: Below 90 Hz, Modulation (%) is less than 5%."

The measured modulation is 77.4 percent against a goal of 5 percent: about fifteen times. The Foundation draws the Department's attention to the words for any lighting source and under all operating scenarios, which are the only place in the document where that formulation is used.

The flicker, at 100.1 hertz and 63.9 percent, is above the 90 hertz boundary, where the seizure practice does not apply. Recommended Practice 1 permits modulation below 0.08 times the frequency, or about 8.0 percent, which the measured value exceeds by a factor of about eight. Recommended Practice 2 permits 0.0333 times the frequency, or about 3.33 percent, exceeded by a factor of about nineteen. The same document's comment at clause 8.1.1.1 adds that it seems reasonable to give a general guideline to avoid flicker below 90 hertz whenever possible. The strobing function of this product is a deliberate modulation at 20.9 hertz.

6. The decision tree, and why it returns no answer

Clause 7.4.1 of the same document contains a risk assessment for photoepilepsy, and Figure 19 states it as a decision tree with three gates taken in order: visual solid angle, luminance change, and frequency. The Foundation applies it to the measured lamp and reports the result, which is not the result the Foundation expected.

The luminance gate is 20 candelas per square meter. Taking the modulated change as 77.4 percent of the measured 700,000 candelas per square meter, or about 542,000, the gate is exceeded by a factor of about twenty-seven thousand. The frequency gate is given in Figure 19 as 1 to 65 hertz, and the measured 20.9 hertz falls within it; it also falls within the 3 to 65 hertz range stated at

clause 7.4.1.4, and within the range of maximum provocation identified in the clinical literature at Part V.E.

The solid angle gate is 0.006 steradians, and the lamp does not meet it. A source of 10.4 square centimeters subtends 0.006 steradians only within about 42 centimeters of the emitting surface. At any distance at which a person would encounter one of these units, the lamp is far below that gate.

Two gates of three are therefore met, and met by very large margins, and the third is not met at all. The Foundation asks the Department to read what the document says about that case, because it says it in terms:

> "No information on the probability of seizure has been located for flicker that meets zero, one, or two (but not all three) of the flicker hazard criteria (solid angle, flash rate, modulation depth)."

The tree assigns such a case to medium risk, and states that it does so by assumption: assuming that the probability of seizure is low or very low, the risk matrix indicates a medium risk level, and the decision tree in Figure 19 is based on this assumption. The document adds that on a different assumption a more complicated decision tree incorporating more risk levels would be necessary.

That is the finding of this subsection, and the Foundation states it without enlargement. The only quantitative framework in existence for assessing this hazard returns, for this product, an answer that its authors identify as an assumption standing in for evidence that has not been located.

7. Why the gate that fails cannot simply be carried across

The three gates are not independent and were not derived independently. Clause 7.4.1.1 takes them from the expert consensus of the Epilepsy Foundation of America working group, which defined a flash as a potential hazard if it has luminance of at least 20 candelas per square meter, occurs at a frequency of at least 3 hertz, and occupies a visual solid angle of at least 0.006 steradians. A footnote to that criterion states what the solid angle figure was calibrated against: an area greater than 25 percent of the area of a television screen, at standard viewing distances of two meters or more.

The document is explicit that the terms interact:

> "The statement recognizes that for flashes less than 20 cd/m2, the risk may be less because the time-averaged luminance is low, but that as the time-averaged luminance increases, lower and lower modulations may be capable of inducing a seizure. The statement was designed for use with displays having a typical luminance of about 200 cd/m2 for which a flash of 20 cd/m2 provides about 5% modulation depth."

Two things follow, and the Foundation separates them because the first is about this document and the second is about the product. The first is that the 5 percent figure in Recommended Practice 3 is not a property of the visual system. It is 20 candelas per square meter expressed as a fraction of a television of about 200 candelas per square meter. The second is that the lamp measured here presents a luminance about three and a half thousand times that display, and the document states that as luminance rises the modulation capable of inducing a seizure falls. Whether the solid angle boundary calibrated at 200 candelas per square meter marks the same boundary at 700,000 is not addressed anywhere the Foundation has looked.

One arithmetical comparison makes the scale of the extrapolation visible, and the Foundation states its limits before stating the figure. It is a comparison of the product of luminance and solid angle, which is proportional to the flux the source delivers to the retina. It is not a seizure threshold, and the Foundation does not offer it as one; the literature at Part V.E establishes that retinal area matters to this mechanism in its own right and not merely as a proxy for flux. With that said: the threshold pairing of 20 candelas per square meter with 0.006 steradians gives a product of 0.12. A modulated change of about 542,000 candelas per square meter reaches the

same product at about 1.7 × 10 to the minus seventh steradians, which for a source of 10.4 square centimeters is a distance of about 68 meters. The lamp delivers the threshold flux from the far side of a parking lot while subtending roughly one five-thousandth of the area the criterion names.

The Foundation does not conclude from this that the solid angle criterion is wrong, and expressly does not ask the Department to find that it is. It concludes that the criterion was calibrated against a class of object this product does not belong to, that the document itself says the criteria interact, and that nobody has done the work that would say where the boundary lies for a small source of extreme luminance. That is a research gap of exactly the kind paragraphs 360ii(a)(2) and (a)(5) direct the Secretary to close, and it is the Foundation's answer to the question this Request for Information asks about research priorities.

The clinical criteria, applied to the same lamp

The preceding paragraphs apply a recommended practice of an engineering body. The clinical criteria are stated by the expert body in the field, in the review described at Appendix C.98, and the Foundation applies them here as well because they are the primary statement from which the engineering document's version was taken.

> "In 2005, a panel convened by the Epilepsy Foundation of America concluded that a flash is a potential hazard if it is brighter than 20 candelas per square meter, occupies at least 10% of the visual field, flashes or changes color at a frequency between 3 and 60 Hz, and endures for at least half a second."

Applied to the measured lamp, three of the four conditions are met and one is not.

Brighter than 20 candelas per square meter. Met. The modulated change is of the order of 542,000, exceeding the condition by a factor of about twenty-seven thousand.

A frequency between 3 and 60 hertz. Met. The measured strobe frequency is 20.9 hertz. The review adds elsewhere that flashes at 15 to 20 hertz are the most likely to provoke seizures.

Enduring for at least half a second. Met. The lamp operates continuously in a pattern that repeats more than twice a second.

Occupying at least 10 percent of the visual field. Not met beyond very short range, for the reason given above: an emitting area of 10.4 square centimeters.

The Foundation states the consequence without enlarging it. Under the clinical criteria as under the engineering decision tree, this lamp fails the spatial condition and meets the others by wide margins. The review says in terms that flashing police car lights only rarely provoke seizures, perhaps because the image rarely occupies a large part of the visual field, and that sentence is set out and answered at Part VI.C.1 rather than omitted here. The Foundation does not assert that this lamp provokes seizures. It asserts that three of four criteria are satisfied, that the fourth is satisfied at close range and not at distance, that no federal instrument limits any of the four, and that the only reason any of them can be evaluated at all is that a private party paid for a measurement.

8. The other criteria, and what they do and do not reach

California Title 24. The report identifies the one American code criterion it could find that addresses the measured quantity. Joint Appendix 8 of the California Building Standards Code requires that light sources exhibit, in the report's quotation of it, less than 30 percent flicker for frequencies at or below 200 hertz, measured at both full and dimmed levels, with Joint Appendix 10 supplying the test method. Both measured values exceed that limit: the flicker at 63.9 percent by a factor of about two, the strobe at 77.4 percent by a factor of about two and a half. The Foundation records two limits on that comparison. It is a State building standard, and whether it reaches a trailer-mounted surveillance unit on a parking lot is a question of California law that neither the report nor this comment resolves. And it is a State standard, which is the point of Part

II: the only operative numerical limit on temporal modulation the Foundation has found anywhere in American law is in the building code of one State.

Glare. The report calculates the small-source Unified Glare Rating for each surveyed location, using a luminous intensity of 728 candelas, a Guth position index of 1 for peak line of sight, and background luminances of 3.0 candelas per square meter for the urban Chicago sites and 0.3 for the suburban Woodland site. On a scale where 19 is just acceptable and 31 is just intolerable, it reports 24.3 at 90 meters, 39.6 at 10 meters and 45.9 at 4 meters at the Chicago pharmacy site, and 29.7 at 50 meters at Woodland. Adjusting the luminous intensity for the intermittency of the strobe, by the flicker index of 0.385, it reports 17.7, 32.9 and 39.3 at the same three Chicago distances. The report states that the minimum distance at which the rating becomes acceptable is 194 meters unadjusted and beyond 73 meters adjusted, and 235 meters at Woodland.

The Foundation records what the report itself says about that metric, because it bears on how much weight the figures carry. The Unified Glare Rating provides a method for determining the acceptability of glare in indoor environments; the report states that an updated metric is needed for the outdoor environment, and that the small-source variant was created to begin to characterize outdoor nighttime glare more realistically. The published scale ends at 31 and the report extends it for presentation. Figures above 31 are therefore outside the range for which the metric is defined, and the Foundation presents them as what they are: a statement that the source is far outside the range of any criterion that exists, rather than a calibrated value.

Illuminance. The report measures 145 lux at one meter and sets it against the recommendation in ANSI/IES RP-43-25 of 4 lux typical and 8 lux maximum for pedestrian safety in a developed commercial space. The report is careful that the comparison is of unlike things, since the function of the product is signaling rather than illumination, and the Foundation repeats that caution here.

9. The spectrum, and the one place where every framework stops

The emission peaks at 456 nanometers with more than 80 percent of its output in the blue. Part V.B.3 and Part V.F set out why that matters. What belongs here is what the criteria do with it, which is nothing. IEEE Std 1789-2015 lists the spectral composition of the light among the parameters on which seizure risk is known to depend, at clause 7.4.1.1, and then states at clause 7 that features associated with wavelength are not considered. The flash criteria of the broadcast guidance address a transition to or from saturated red and nothing else. The photobiological framework at Part V.C.2 addresses blue light but by a weighted radiance the Foundation cannot compute from this report. A near-monochromatic blue source operated in a strobing mode is a case that every instrument in this field names as relevant and none evaluates.

One corroboration belongs here, from a different literature and a different purpose. The study described at Appendix D.4, conducted under contract to the United States Fire Administration, measured discomfort glare from flashing warning lamps of four colors at equal intensity and found that blue and white were the most glaring and that the effect of color was about twice the effect of intensity, attributing the result to short-wavelength content. The lamp measured in this subsection emits more than eighty percent of its output in the blue with a peak at 456 nanometers. On the only federally funded assessment of discomfort glare from flashing lamps the Foundation has found, this product sits at the worst end of the spectral axis, and nothing in the photobiological framework at Part V.C.2 or in any instrument described in Part II reaches that fact.

10. What the Foundation does not claim from this report

Four things, stated so that the Department does not have to find them. The report is not a health study. It reports no biological endpoint, no exposure of any identified person, and no clinical outcome, and it does not claim to. Its statements about health risk are the stated opinion of a lighting consultant about what the measured values imply, and the Foundation relies on the measurements rather than on those statements.

The report does not state the accuracy or uncertainty of its instruments, and does not map each instrument to each reported reading. The Woodland site was not surveyed in person; it was assessed remotely from geographic information system data and eyewitness accounts, and the Foundation does not place the Woodland figures on the same footing as the Chicago ones.

The luminance of 700,000 candelas per square meter was measured with the lamp in its steady setting rather than while strobing. The report argues that averaging the output of an intermittent source over time, while correct as photometry, does not represent the physiological experience of a dark-adapted viewer, and illustrates the point with a photographic flash. The Foundation records that this is an argument rather than a measurement, and that the report itself applies a time-averaging factor of 0.385 when it calculates glare. Where this comment uses a modulated luminance change it computes it from the measured modulation of 77.4 percent, and says so.

And the report is internally inconsistent in three places that the Foundation has found, each of which is recorded at Appendix D.4 and none of which affects the measured values relied on above.

11. What follows for this Department

A product is in use on American streets whose emitting surface is at a luminance of the order of 700,000 candelas per square meter, which strobes at 20.9 hertz with 77.4 percent modulation, which carries a further 63.9 percent modulation at 100.1 hertz from its driver, whose output is more than 80 percent blue with a peak at 456 nanometers, and which is aimed at public sidewalks and roadways and operated unattended at night. Every one of those figures exists because a private party commissioned a consultant to measure them. No federal instrument sets a limit on any of them. The only quantitative criterion that addresses the modulation is a voluntary recommended practice that this product exceeds by factors between eight and three hundred and seventy, and whose own risk assessment returns, for this product, an answer its authors describe as an assumption made in the absence of located evidence.

J. Signage, Billboards, and Dynamic Message Displays

This product class differs from every other in this Part in one respect, and the Foundation puts it first because the rest of the subsection follows from it. These are the largest emitting surfaces in the built environment. A roadway luminaire presents an aperture measured in centimeters and a retail downlight rather less; a video display on the side of a building presents one measured in meters. Part V.B.2 establishes that the distance at which a source ceases to be resolved by the eye, and therefore the distance beyond which retinal exposure begins to fall, scales with the size of the emitting aperture. For this class that distance is measured in kilometers.

1. What the products are

Direct-view light-emitting diode video displays, installed outdoors and oriented toward public space. The class includes video billboards on buildings and roadside structures, perimeter and facade displays at stadiums and arenas, dynamic message signs on highways, and the increasingly common replacement of printed signage with emissive panels on commercial premises. The emitting surface is an array of discrete diodes rather than an illuminated translucent face, which distinguishes this class from the backlit sign it replaced: the older product diffused light through a lens or a vinyl face, and this one does not.

Two characteristics of the class are material and both follow from its construction. The content changes, so the emission is temporally modulated by design and not merely as an artifact of the driver, which distinguishes it from the flicker treated at Part V.D. And the luminance is set to be legible against daylight, which means it is set against the brightest background the product will ever face and is then operated against the darkest.

2. Who is exposed, and under what conditions

Two populations, and the second is the one this subsection is about.

The audience for whom the product is designed looks at it deliberately and briefly: a driver reading a message sign, a spectator watching a replay. That exposure is voluntary in the ordinary sense and the Foundation does not treat it as the problem.

Residents of the surrounding area did not choose the exposure, cannot alter it, and receive it from inside their own dwellings for as long as the display operates. The emission enters windows. It is present during the hours when the occupant is attempting to sleep, if the display operates then, and in the field of view whenever the occupant looks outward. This is the condition of exposure that paragraph 360ii(a)(4) directs the Secretary to study and evaluate, and the Foundation is aware of no federal study of it.

3. Source size, and why distance does not resolve the problem

The Foundation works the arithmetic for a specific installation because it is the clearest demonstration in this comment of the proposition at Part V.B.2. The installation is described at paragraph 4 below: three outdoor video displays, each approximately thirty feet by fifty feet.

Thirty feet is 9.14 meters, and the Foundation uses the smaller dimension because it governs. Applying the relation at Part V.B.2.c, that the distance at which an aperture subtends a given angle is the aperture divided by the angle:

The display subtends 100 milliradians, the upper bound of the averaging field, at approximately 91 meters.

It subtends 11 milliradians, the criterion below which the retinal photochemical hazard may be assessed as an irradiance rather than a radiance, at approximately 830 meters.

It subtends 1.5 milliradians, the minimum angular subtense beyond which the inverse square law begins to govern retinal exposure, at approximately 6.1 kilometers.

Within five kilometers of that display, the irradiance delivered to the retinal image of it does not diminish with distance. A resident at four kilometers and a resident at four hundred meters receive, at the retinal image, the same irradiance; what differs is how much of the retina receives it. The Foundation asks the Department to compare that with the approach the public health assessment described below took to the same installation, which was to identify as a needed datum the "data on nearby residential distances and lines of sight to the screens." Line of sight governs. Distance, within that radius, does not.

The Foundation states the limits of that arithmetic. It assumes the whole emitting surface is at a common radiance, which a video display showing an image is not: the relevant aperture at any instant is the bright region of the picture, which may be a fraction of the panel. It assumes clear air. And it concerns the irradiance within the retinal image rather than the total optical power entering the eye, which does fall as the inverse square throughout, as Part V.B.2.b explains. The proposition is not that a distant display is as hazardous as a near one. It is that moving a dwelling further away does not reduce the intensity of the exposure at the retina, which is what a setback requirement assumes it does.

4. What a public health body found when it examined this class

The Foundation has located one assessment of this product class by a public health body, and it is not a United States one. In January 2013 the National Collaborating Centre for Environmental Health, a body funded by the Public Health Agency of Canada, published an evidence brief by M. Shum and M. Wiens titled Health effects of large LED screens on local residents. It is an organizational publication and not peer-reviewed research, and the Foundation identifies it as such; it is listed at Appendix D and is not an entry in Appendix C.

The brief examined three high-definition light-emitting diode video billboards, each approximately thirty by fifty feet, installed in 2011 around a sports stadium, and considered four potential effects on nearby residents: photosensitive epilepsy, retinal damage, stress and

annoyance, and circadian or sleep disruption. Its overall conclusion is the reason the Foundation brings it forward:

> "The lack of information on exposure characteristics of the LED video billboards and the affected population, along with the lack of scientific evidence informing the process, precludes undertaking a current risk assessment."

The Foundation asks the Department to attend to the first of those two grounds. The brief did not conclude that the evidence was adverse or that it was reassuring. It concluded that the assessment could not be performed, and the first reason given was the absence of data about the exposure. Among the data the brief identified as needed were the screen manufacturer, the flicker frequency and the maximum luminance — which is to say, what the product emits.

How the brief treated luminance is the part that bears most directly on this comment. It records that the supplier listed the maximum luminance of the displays as 5,000 to 6,000 cd/m², and that the actual measurements were unknown. The brief then disposed of the retinal question by reference to a screening threshold which it attributes to the 1997 guidelines of the International Commission on Non-Ionizing Radiation Protection, to the effect that sources below 10,000 cd/m² are not hazardous and that radiometric measurement is not necessary. Because the displays were believed to operate below full capacity and therefore below that figure, the risk was judged limited.

The Foundation does not say the brief was wrong to reason that way; the threshold is what the guidance provides and the brief applied it honestly and said what it did not know. The Foundation says that the reasoning illustrates the structure this comment is about. A finding of limited hazard was reached on the strength of a figure from a manufacturer's specification sheet, unverified by measurement, compared against a threshold whose function is to make measurement unnecessary. Part V.K.3 describes the same structure in the 2018 SCHEER Opinion, where a safety conclusion was conditioned on exposure limits. Here the conclusion is conditioned on a screening threshold below which the limits need not be evaluated at all.

The brief also stated four gaps, in 2013, which the Foundation reproduces because they describe the position thirteen years later:

- That no studies examining physiological stress responses to unwanted outdoor light in humans were found.
- That no research had been done specifically on large light-emitting diode screen exposure and retinal damage.
- That sleep and metabolic effects had yet to be studied in relation to exposure to outdoor light at night.
- That data were needed on residential distances, lines of sight and the characteristics of the exposed population.

5. The daytime comparison, and the condition of use

The brief placed the luminance of the displays in context by comparison with the sky, recording that the sky on a cloudy day has a luminance of about 3,000 cd/m², rising to 6,000 to 10,000 cd/m² on a clear day. On that comparison a display at 5,000 to 6,000 cd/m² is unremarkable: it is no brighter than the sky behind it.

The Foundation accepts the figures and identifies what the comparison omits. A display designed to be legible against a daytime sky is operated after dark against a background several orders of magnitude dimmer. Part V.C.4 sets out the discomfort glare metric and identifies the background luminance in its denominator: the same source luminance against a darker background yields a higher glare rating, and the relation is not marginal. A luminance that matches the daytime sky is not a luminance that matches the night sky, and the comparison with daylight describes the one hour of the product's operation when it is least consequential for a resident.

Two further quantities in the brief are worth recording, because the comment elsewhere argues about luminance at length and states few values. The brief sets out five limits which it attributes to guidance of the International Telecommunication Union produced for broadcasters, Recommendation ITU-R BT.1702 of 2005, Guidance for the reduction of photosensitive epileptic seizures caused by television: that flashes with a frequency greater than 3 Hz are prohibited; that flashes with changes in luminance of 20 candelas per square meter or more are prohibited; that flashes covering more than one quarter of the screen area are prohibited; that flicker from saturated red light is prohibited; and that the color, size and duration of striped images are limited. And the brief separately identifies alternating dark and bright images differing by 20 candelas per square meter as of greatest concern for photosensitive epilepsy, which is the subject of Part V.E.1.

The Foundation draws attention to the position that leaves. A numerical flash criterion exists, is expressed in the quantity that governs, and applies to the television in a dwelling but not to the sixty-foot display outside its window.

The third of those five is worth isolating, because it is a spatial criterion and this comment has argued a spatial point. The limit is expressed as a proportion of the screen area, and the brief explains why in its own discussion of what provokes seizures: "The larger the visual image, the greater the portion of the brain is stimulated. This variable also depends on the distance of the viewer from the source." That is the quantity the arithmetic above concerns. For a broadcast image the proportion of the visual field is fixed by the television and the room. For a thirty by fifty foot display outside a window it is fixed by nothing, and it is larger for the nearer resident.

The Foundation records, because it bears on how much the brief can be made to carry, that the brief does treat these broadcast criteria as the applicable benchmark for the installation. Its conclusion on this head is conditional: the risk of photosensitive epilepsy "should be minimal if images on the LED screen comply with the International Telecommunications Union recommendations to prevent photosensitive seizures". The Foundation adopts the finding and draws attention to the condition. Compliance by a display with broadcast content guidance is a choice made by whoever loads the content. No instrument identified anywhere in this comment requires it, no authority verifies it, and the brief did not know whether it was happening at the installation it was asked about. It is the same structure Part VI.J.6 describes in the brightness criterion: a safety conclusion resting on a setting rather than on a property of the product.

Two statements in the brief that run against this comment

The first concerns flicker, on which this comment argues at length at Part V.E. The brief states that "Most LEDs are designed to control for these fluctuations, and perceptible flicker occurs only when the LED is deeply dimmed", citing work of Bullough and others. The Foundation records that statement, does not suppress it, and notes three things about it rather than disputing it. It concerns perceptible flicker, and Part V.E concerns modulation at frequencies above the threshold of perception as well as below it. It is a statement about design intent across a product category rather than a measurement of these displays, whose modulation the brief elsewhere records it did not know. And deep dimming is the condition under which these particular displays operate at night, the brief recording that two of the three run at twenty-five percent of capacity outside the hours of nine to seven and the third at twenty percent.

The second concerns the evidence base generally, and the Foundation quotes it because it is the fairest statement of the position and because it is adverse to any suggestion that the science is settled in the Foundation's favor: "Most of the research examines indoor lighting, personal screen use, or occupational exposures to industrial lighting and thus may not be generalizable to the scenario of exposure to a large outdoor screen." The Foundation agrees, and that sentence is the reason this comment asks for a research program and a measurement requirement rather than asking the Department to find a hazard established.

A feature of the brief's reference list, stated because the Foundation would rather disclose it than be shown it

The reference list of the brief contains three documents that do not appear to belong to the propositions near which their numbers fall. Reference 7, which the text cites for the proposition that workplace lighting conditions have been studied across office and health care settings and that inability to control lighting is associated with worker stress, is listed as Cummings J., Wind farm noise and health, Acoustic Ecology Institute. Reference 11, which the text cites for the spectral dependence of melatonin suppression, is listed as Bartholomew R.E., a letter concerning a review of the published literature on epidemic hysteria. A further entry is a summary of seventeen reviews of the research literature on wind farms and health.

The Foundation states the innocent explanation first and believes it to be the likely one: the in-text superscripts and the numbered list in the published web version do not align, and this is a numbering fault rather than a representation that wind-farm literature supports propositions about lighting. The Foundation makes no allegation and draws no inference about the authors. It records the matter for two practical reasons. The first is that the comment should not rest any proposition on a passage whose supporting citation cannot be identified, and it does not: the propositions the Foundation takes from this brief are its statements about what was not known and what had not been studied, which are statements about the brief's own inquiry and require no citation. The second is that a comment which relies on a document ought to have read its reference list.

6. What federal requirement governs the optical output

As to the optical output of these products the Foundation can identify none. Outdoor displays are regulated where they are regulated at all by municipal sign ordinances and by State highway authorities, and those instruments address size, placement, dwell time and in some cases illuminance measured at a property line. None of them, so far as the Foundation has found, limits the luminance of the emitting surface, the spectral content of the emission, or the depth and frequency of its temporal modulation. Part IX.C and Part IX.I.

The criterion the ordinances use, who wrote it, and what it says it does not address

The paragraph above records that control of these products, where there is any, is municipal. The Foundation sets out the technical basis of that control, because there is one, because it is not a public instrument, and because the document which supplies it is explicit about the question it does not reach. The report is described at Appendix D.4. It was prepared by Ian Lewin of Lighting Sciences Inc. of Scottsdale, Arizona, is dated November 26, 2008, and states its own commission: it was prepared for the Outdoor Advertising Association of America under contract, for the development of nighttime brightness recommendations for digital billboards.

The criterion it recommends is 0.3 footcandles above ambient, measured with a footcandle meter held at eye height and faced toward the display at a standardized viewer distance, which for a 14 by 48 foot bulletin is 250 feet. It is derived from the light trespass practice of the Illuminating Engineering Society of North America. The Foundation draws attention first to the quantity. The criterion is expressed in illuminance at a stated distance, which is the form Part V.B.2 identifies as incapable of constraining retinal exposure, and not in the luminance of the emitting surface.

The report nonetheless permits the conversion, and supplies the formula for it, so the luminance the criterion implies can be computed. Its equation A5 gives luminance in candelas per square meter as 10.76 multiplied by the illuminance in footcandles, multiplied by the square of the distance in feet, divided by the area in square feet. For the standard bulletin at the standard distance the recommended limit works out at about 300 candelas per square meter. That arithmetic is the Foundation's, using the report's formula and the report's own standard geometry, and the figure is not stated in the report.

The report also measured a real display, and the comparison between the two sets of figures is the material one. A commercially produced electronic display of 20 millimeter pixel spacing, made in

2006, was measured on a goniophotometer by the approved methods of the Illuminating Engineering Society.

Color at the 100 percent setting	Measured luminance (cd/m²)
White, 6,800 kelvin	7,000
Green	5,100
Red	1,500
Blue	700
Implied by the recommended criterion	about 300

The recommended nighttime criterion is therefore about 4 percent of what the hardware was measured to deliver. Three consequences follow and the Foundation separates them. The emitting surface of this product class is capable of some twenty-three times the brightness the criterion contemplates after dark. Compliance is accordingly not a property of the product but a setting on it, and depends on the dimming being configured correctly and left so. And the comment's own figures at subsection 5 above place the measured full-output value of 7,000 candelas per square meter inside the range given there for a clear daytime sky, which is consistent: the hardware is built for daytime legibility and must be turned down by a factor of more than twenty at night.

The Foundation adds one comparison from Part V.C.2, because it locates this product in the photobiological framework. The governing exposure guidelines state that assessment of a source is normally required only where its luminance exceeds ten thousand candelas per square meter. The measured white output of this display is 7,000. It sits at about seventy per cent of the threshold at which the photobiological framework would begin to look at it, and therefore below it, and the Foundation does not suggest that the framework has been breached. What it asks the Department to notice is that a product encountered by the public from a public road sits within a factor of one and a half of a screening threshold, and that no one is required to measure it.

Then the exclusion, which the Foundation quotes rather than summarizes because the words are the author's and they are unambiguous.

> "The investigations and this report do not cover factors related to changing images and billboard message movement. Issues that may be related to motorist attention are beyond the scope of the work and use of the proposals in this study should be based on that understanding."

So the criterion that governs the brightness of a changing illuminated display states, in the document that developed it, that it does not cover the changing of the images, the movement of the message, or anything related to the attention of motorists. The Foundation makes no complaint of that. A consultant instructed to develop a brightness recommendation is entitled to define his scope and is to be commended for stating it. The point is what follows for the Department. When it is said that these products are regulated, what is meant is this criterion; and this criterion disclaims the effect on driver attention, which is the effect the public would most expect a limit on a roadside display to address.

One further matter is recorded as a chronology, without characterization, because the sequence is the fact. The report considered two possible bases for the recommendation. One was driver glare, of which it states that the procedures of the Illuminating Engineering Society "can, in theory, be used to produce limitations on digital billboard luminance that will ensure that any glare problems created for drivers will be relatively minor". The other was light trespass. The report states that of the two "the first method has disadvantages" and recommends the second. It also sets out the three requirements the analysis was to satisfy, the third being "The needs of OAAA members, who require effective use of digital billboards, which in turn requires adequate brightness for clear visibility." A glare-based criterion was available and was described as

workable in theory. A nuisance-based criterion was adopted. The commercial requirement for brightness was one of the three stated constraints on the choice. The Foundation states those three facts and draws no inference from them beyond the one in the next paragraph.

The inference is about the record rather than about anyone's motives. The only operative brightness criterion for this product class in the United States was developed under contract to the industry that sells it, is expressed in a quantity that does not constrain retinal exposure, implies a luminance some twenty-three times below the measured capability of the hardware it governs, and excludes driver attention from its scope by its own terms. That is not a criticism of its author, who disclosed every one of those features in the document itself. It is the answer to the question whether anybody has set a limit for this class on health or safety grounds. The Foundation submits that nobody has, and asks the Department to do so under paragraph 360ii(a)(4) and, if warranted, paragraph 360kk.

What tells the other way is recorded at Appendix D.4 and summarized here. The report states that its luminance figures represent a worst case of an all-white display which it describes as unlikely absent a malfunction; that displays viewed at an angle, as most are, present substantially lower luminance than the head-on figures; and that on a comparison with measurements by the Lighting Research Center of Rensselaer Polytechnic Institute, digital billboards will be only slightly brighter than the maximum luminance of conventional billboards. The first two are reasons the measured values overstate ordinary exposure. The third is a comparison drawn against the brightest of the class being replaced rather than against its typical member, and the Foundation notes the distinction without pressing it.

The temporal questions the American criterion excludes, which have been reduced to numbers elsewhere

The exclusion quoted above is the center of this subsection. The only operative American brightness criterion for this product class states, in the document that developed it, that it does not cover changing images, message movement, or anything related to the attention of motorists. The Foundation records here that those questions have been reduced to numbers in other jurisdictions, because whether a criterion can be drafted bears on whether one should be.

The source and its weight, stated before its contents. Zhu Y., Consider digital billboards a contributing outdoor light source, Buildings, 28 July 2023, described at Appendix D.1. It is a short article in a trade publication by a lighting practitioner. It reports no measurement, conducts no study, and its substance is a summary of other documents. The Foundation relies on it for one thing only, which is to identify criteria that exist and the instruments that carry them.

The criteria it reports, which it attributes principally to guidance of the New Zealand Transport Agency and to related sources, are these:

- a minimum dwell time, being the interval between successive images, of eight seconds, which the article describes as "widely accepted by the industry";
- a finding that "Images with dwell time shorter than 7 seconds attract the attention of drivers more than road signs";
- a maximum transition between successive displays of "between 0.5 to 2 seconds, without other visible effects";
- a requirement that "the average luminance level should not fluctuate greater than 30% between images";
- restrictions on how many displays may fall within a driver's field of view, the article reporting that "In the U.S., standards limit the number of billboards to two or three within the driver's field of view";

and placement rules, of which the example given is a New Zealand district plan requiring billboards to stand at least fifty meters from a signalized intersection and not to be "directly visible from a residential zone".

The fourth of those is the one the Foundation places before the Department. A limit on how much the average luminance may change between successive images is a modulation criterion. It is expressed as a percentage change in a photometric quantity, which is the form the recommended practices at Part V.D.3 take, and it governs the same variable that Part VI.J.8 asks the Department to characterize for this class. Somebody has written the number down. It is not in any American instrument the Foundation has found.

The Foundation states with equal clarity what these criteria do not do. Not one of them limits the luminance of the emitting surface. They govern how long an image stays, how fast it changes, how much the average may change between images, how many displays a driver may face and where they may stand. The quantity this subsection has shown to be unregulated, which is how bright the surface is allowed to be, is unregulated in these instruments too. Two jurisdictions have addressed what changes, and neither has addressed how bright.

One further formulation is worth adopting because it is careful, and because the comment has elsewhere declined less careful versions of the same claim. The article states that "research has not proven that digital billboards affect motor vehicle crash rates", while reporting that they "may have an impact on driver speed, lateral control, mental workload, ability to follow road signs, and eye movements and fixations". That is the same distinction Part VI.J.7 draws from the one rigorous causal study in this field, and the Foundation adopts it: the demonstrated effects are on what drivers do with their attention, and the crash question remains open.

And the article's own conclusion, which the Foundation records because it is the position this whole Part describes: that the number of these displays is expected to increase, and that "their lighting impacts on traffic, environment, and public wellbeing are not yet fully understood".

The eight second figure, corrected by the research it rests on

The Foundation reported the dwell time criteria above from a trade article, and recorded there that it had not read the instruments behind them. It has since read a document that reviews the underlying research, and it corrects one of those figures here rather than leaving it to stand.

Wachtel J., Compendium of Recent Research Studies on Distraction from Commercial Electronic Variable Message Signs (CEVMS), The Veridian Group, Inc., February 2016, described at Appendix C.113. The Foundation states its nature first. It is a review of other people's work, not primary research, and nothing in it was measured by its author. It is the second update to a report the same author prepared in 2009 for the American Association of State Highway and Transportation Officials under National Cooperative Highway Research Program Project 20-7/256, and it summarizes twenty-one studies in tabular form, giving for each one its sponsor, its method, its findings and its weaknesses. It is now ten years old and captures nothing published since.

The correction concerns the minimum dwell time of eight seconds, which the trade article above describes as widely accepted by the industry. The most recent study in this compendium is an on-road study of that very question, and its authors reach the opposite conclusion. Belyusar D., Reimer B., Mehler B. and Coughlin J.F., A field study on the effects of digital billboards on glance behavior during highway driving, Accident Analysis and Prevention, volume 88 (2016), pages 88 to 96, conducted at the New England University Transportation Center and the Massachusetts Institute of Technology AgeLab, with one hundred and twenty-three subjects driving an instrumented vehicle past a digital billboard on a sixty-five mile per hour highway. The subjects were divided between men and women and between drivers aged twenty to twenty-nine and drivers aged sixty to sixty-nine. They were given no task; they simply drove.

The finding is reported in the compendium in the authors' own words, and it is about the moment of change rather than about the display:

> "Drivers glanced more at the time of a switch to a new advertisement display than during a comparable section of roadway when the billboard was simply visible and stable."

And their conclusion, which is the correction:

> "Given typical billboard dwell (cycle) times of six (6) or eight (8) seconds, these findings add to the argument the dwell times for such signs should be considerably longer."

So the figure the Foundation reported above as the industry-accepted minimum is the figure the most recent on-road measurement in this field identifies as too short. The Foundation does not ask the Department to adopt eight seconds, or any other number, and it withdraws no part of what it reported, which was an accurate account of what the trade article says. It records the correction because a criterion described as accepted by the industry that sells the product, and contradicted by the research, is the same pattern this subsection has already described in the brightness criterion, and the Foundation would rather state it against its own earlier paragraph than leave the figure unqualified.

The mechanism, which is the part of this that belongs before the Department

The Foundation is candid about the limits of this document for its purposes. Not one of the twenty-one studies measures a health endpoint, a visual endpoint or any biological effect whatever. They measure glance duration, lane position, reaction time and crash rates. Driver distraction is the business of the National Highway Traffic Safety Administration and the Federal Highway Administration, and the Foundation does not suggest that the Department of Health and Human Services should take up road safety.

One thread in it does belong here, and the Foundation confines itself to that thread. It is the mechanism by which these displays take a driver's attention, which the review describes as involuntary and physiological rather than as a choice:

> "This attention is often captured through a 'bottom up' physiological process, in which the driver attends to the sign unintentionally and unconsciously, with the eyes captured involuntarily by the sign's changing imagery, brightness, conspicuity, and/or movement."

One of the reviewed studies, Roberts, Boddington and Rodwell for Austroads in 2013, states the same thing in terms of the optical property itself:

> "The appearance of movement or changes in luminance can involuntarily capture attention, and engaging information can capture attention to the detriment of driving performance, particularly in inexperienced drivers."

That is a statement about what a change in luminance does to a person who did not choose it, and it is the proposition this comment has advanced throughout about this class of product. The quantity named is luminance. The response named is involuntary. Whether such a response is properly characterized as a biological effect of electronic product radiation within the meaning of the statute is a question for the Department, and the Foundation asks it rather than answers it. But the Department cannot reach that question while the only American criterion for this product class excludes changing images from its scope by its own terms, and while no federal health authority has examined the matter at all.

A second study in the review, Edquist, Horberry, Hosking and Johnston in 2011, records the consequence in the same involuntary terms: billboards "can automatically attract attention when drivers are engaged in other tasks, delaying their responses to other aspects in the environment", and that effect was strongest in scenes already cluttered with visual material, which the authors note is where these displays are most often erected.

A natural experiment, recorded with its limitation

The review describes one study the Foundation considers worth setting out, because its design is one that rarely becomes available. Following complaints, the Supreme Court of Israel ordered a series of

billboards on an urban freeway near Tel Aviv to be covered for one year while an evaluation was carried out. At the end of that period they were uncovered. Gitelman, Zaidel and Doveh studied eight treatment sites and six control sites on the same highway, with traffic volume as a control variable, across the period in which the displays were present, then covered, then present again.

The review reports that at the control sites crashes were essentially unchanged throughout, and that at the treatment sites, after adjustment for traffic volume, covering the displays was associated with reductions of sixty percent in all crashes, thirty-nine percent in injury and fatal crashes and seventy-two percent in property damage crashes. The later paper adding the third period reports that removal was associated with a thirty to forty percent reduction in injury crashes on two different databases, and that uncovering them again was associated with an increase of forty to fifty percent or eighteen to forty-five percent in such crashes depending on the database, with similar trends for damage-only, injury and total crashes and for night-time against daytime injury crashes.

The Foundation records the limitation in the same breath, and it is severe. The review states that the complete study exists in Hebrew only and that an English translation is available for the executive summary alone. The Foundation has read neither. Every figure in the preceding paragraph is at third hand: a review's account of a report the reviewer read in summary. The Foundation offers it to the Department as an indication of where the evidence points and as a document worth obtaining, and not as a fact it has verified.

What runs the other way, stated because it does

Three of the reviewed studies found no such effect, and the Foundation sets them out rather than reporting only the twenty-one that suit it.

- The Federal Highway Administration's own study, Perez, Bertola, Kennedy and Molino in 2012, used an instrumented vehicle in Pennsylvania and Virginia by day and by night and found that digital billboards "were not associated with 'unacceptably long glances away from the road'". That is the federal government's own finding and it runs against the position this comment takes.
- Hawkins, Kuo and Lord in 2014, sponsored by the on-premise signage industry, analyzed crash data at one hundred and thirty-five sign locations against one thousand three hundred and one control sites in four states and found "no evidence the installation of on-premise signs at these locations led to an automatic increase in the number of crashes".
- Samsa and Phillips in 2015, for the Outdoor Media Association of Australia, found fixation durations well below three quarters of a second and no significant difference in vehicle headway, though they did find poorer lateral deviation when billboards were present. The review records that only an abstract of that study is available.

The review disputes the first of those three at length and the Foundation does not adopt the dispute. Its author wrote the critique on which the review relies to set the federal study aside, which is to say that on this point the reviewer is a party. The review also makes an allegation about the conduct of a different industry-sponsored study which the Foundation will not repeat and does not rely on, because no evidence for it is given in the document and the Foundation is not in a position to test it. What the Foundation takes from the review on this point is only the undisputed procedural fact it records: that the federal study was released on the agency's website, has never been formally published, and carries no agency report number.

The American criterion tested by people who had to use it

The preceding passages describe the criterion from its own documents. The Foundation now records what happened when a road authority and a university optometry department set out to apply it.

Krumina G., Volberga L., Ikaunieks G. and Naumovs L., The Development of Brigthness Evaluation Method for Digital Billboards, IOP Conference Series: Materials Science and Engineering, volume

1202 (2021), article 012035, described at Appendix C.111. The first three authors are of the Department of Optometry and Vision Science at the University of Latvia and the fourth of the Department of Road Equipment and System of the Latvian State Roads. The work was funded by that road authority and by the university. It is open access under a Creative Commons licence, and its object was practical: to find a way for a supervising authority to check the brightness of a billboard while it is operating, using an instrument the authority can afford.

What they found when they applied it

They tested the method of the Outdoor Advertising Association of America and the International Sign Association, which they describe as developed to simplify the recommendation of a former member of the board of the Illuminating Engineering Society of North America, naming the author of the report at Appendix D.4. Their conclusion, in the abstract:

> "We tested the recommended method of OAAA and concluded that it is not applied for large billboards (over 25 square-meter) due to the calculated far distance and low sensitivity of lux meter."

The Foundation draws attention to the nature of that failure, because it is not a disagreement about stringency. The American method fixes the measurement distance by the dimensions of the screen, so that a large display must be measured from far away; and at that distance the quantity to be measured, an illuminance increment of three tenths of a foot-candle above ambient, falls below what the instrument the method prescribes can reliably read. The criterion is not merely permissive for large displays. On this assessment it cannot be applied to them at all.

A structural objection, and an independent check on the Foundation's arithmetic

Their second objection concerns area. The American method yields a permitted luminance that does not vary with the size of the display, and the authors state the consequence twice, in their analysis and again in their conclusions: "The larger the digital billboard area, the more it dazzles a person if the luminance remains constant", and "The larger the area of digital billboard or light object, the more it dazzles the driver even at a low screen brightness level". Their own proposed limit accordingly scales inversely with the square root of the billboard area.

They also compute what the American criterion implies in luminance, and the figures matter to this comment for a reason independent of their argument. Part VI.J.6 above derives, from the formula in the American report itself, an implied luminance of about 300 candelas per square meter for the standard bulletin at the standard distance. These authors, working independently in Latvia from the same method, obtain 322 candelas per square meter for an intrinsically dark environment, rising to 423, 524 and 827 as the setting moves through rural, suburban and urban ambient levels. The Foundation records the correspondence because the arithmetic at Part VI.J.6 is its own and this is the only independent check on it the Foundation has found.

What the criterion permits, measured on the discomfort scale

The authors then do the thing nobody in the American record has done. They take the luminances the method permits and evaluate them against the De Boer scale of discomfort glare, which they define as running from 1 for unbearable glare through 3 for disturbing, 5 for just acceptable and 7 for satisfactory to 9 for unnoticeable, and on which they state that comfort begins at 5. The computation was performed for a real installation, a billboard of 52 square meters at a crossroad on Lielirbes street near Riga, standing 15 to 19 meters from the edge of the road.

The results for the American method, at two viewing distances and four ambient zones, are these:

- in the darkest zone, a permitted luminance of 19 candelas per square meter at 30 meters, rating 4.7; and 215 at 100 meters, rating 3.9;
- in the next zone, 58 at 30 meters rating 5.2, and 646 at 100 meters rating 4.3;
- in the third, 155 rating 4.5, and 1,722 rating 3.8;

in the brightest ambient zone, 291 rating 4.2, and 3,229 candelas per square meter at 100 meters, rating 3.5.

Seven of those eight ratings fall below the value the authors identify as the threshold of comfort, and the paper marks those seven as out of criterion. Four of them fall closer to the scale's label for disturbing glare than to its label for acceptable. The comparison the Foundation draws is with the authors' own proposed limits, which return ratings between 5.2 and 6.5 and are marked as within criterion throughout. It is not with the Netherlands instrument they also assess, which fares better than the American method but not well: three of its six tabulated ratings, those at the thirty meter distance, are also marked out of criterion.

The Foundation states the proposition carefully. This is a calculation and not a survey of people: the De Boer values are predicted from an illuminance-based model, which the authors report correlates with measured ratings at a Pearson coefficient of 0.87 in the study they take it from. What it establishes is not that any particular billboard caused discomfort to any particular person. It is that when the only operative American brightness criterion for this product class is evaluated against the standard scale for the effect it exists to prevent, it permits values that the scale classes as uncomfortable.

Why this bears on Part VI.B.2 as well

The scale these authors define is the scale on which the American evaluation of adaptive driving beam headlamps at Part VI.B.2 rested. That evaluation reported ratings between six and seven and described the result as low perceived glare. On the definition given here, 7 is satisfactory and 5 is just acceptable, so those ratings sit where the evaluation placed them. The Foundation records the definition here because the comment uses the scale in two places and should use it consistently, and because a reader meeting a De Boer number anywhere in this comment is entitled to know what the number means.

One finding the Foundation notes for Part V.E

In reviewing the literature the authors report a Taiwanese study in which drivers rated their comfort against the angular size, brightness and image flicker rate of a light-emitting diode screen, and in which "the larger discomfort in the study participants was at a screen flashing at a frequency of 16 Hz". The Foundation records that at second hand and does not rely on it, but notes that 16 hertz falls within the band Part V.E.1 identifies as carrying the greatest photosensitive risk, and that the study is therefore worth obtaining.

What this paper does not establish

It is a conference paper, its measurements were made on billboards near Riga, and its purpose was to design a practical inspection method rather than to study any health outcome. It measures no biological endpoint and examines no one; its discussion asserts that the difference between a billboard's illuminance and ambient lighting at night can cause sleep disorders for people living nearby who receive the light through their windows, but offers no evidence for that and the Foundation does not rely on it. Its central comparison is computed rather than observed: no person rated any of the installations whose De Boer values it tabulates. Its criticism of the American method is directed at that method's usability and its treatment of area, not at any claim about injury. And the Foundation notes that an assessment of an American instrument by authors applying it in a different regulatory and lighting context should be checked rather than adopted.

What these screens are measured to emit, and what the road they stand beside emits

The passages above concern what the criterion permits. This one concerns what the products do, and it supplies the comparison this subsection has lacked.

He Y., Zhang X., Quan L., Mi R., Cui Y., Xu J. and Tian Z., Influence of coloured light projected from night-time excessive luminance outdoor LED display screens on vehicle driving safety along urban roads, Building and Environment, 2021, described at Appendix C.112. The authors are principally of

Chongqing University and the work was supported by the National Natural Science Foundation of China. The Foundation states at once what it has read. The article is behind a paywall and the Foundation has read its abstract, its list of highlights, its introduction and the truncated section summaries the publisher displays. It has not read the methods, the results or the conclusions in full.

The two luminances

The first figure is the screen. The authors state that they determined, in combination with field tests, the "excessive luminance values of typical OLDSs at night (1,000, 3,000, and 5100 cd/m2)", and used those three values as the experimental conditions.

The second figure is the road. In their introduction they state that "The average luminance of the urban road surface at night is usually 1.0–2.0 cd/m2, which causes the visual characteristics of vehicle drivers to change from photopic vision in the daytime to mesopic vision at night-time".

The arithmetic is the Foundation's and it is simple division. A display at the lowest of those three values is of the order of five hundred to a thousand times the luminance of the road surface beside it. At the highest it is between two and a half and five thousand times. The driver is required to read a roadway at one to two candelas per square meter while a surface of several thousand stands in the same visual field.

Set against the criterion, the same figures give the measure of the gap this subsection has been describing. The implied luminance of the American criterion is about 300 candelas per square meter on the Foundation's own derivation and 322 on the independent one at Appendix C.111, rising to 827 for the brightest urban ambient zone. Typical screens as these authors measured them run from about three to about sixteen times the first figure, and from about one and a quarter to about six times the second. The proposition at Part VI.J.6, that compliance with this criterion is a setting on the product rather than a property of it, is corroborated by field measurement on another continent.

The authors say as much directly, and the Foundation quotes it because it is the clearest statement of the point the comment has found anywhere: "To pursue better advertising effects, the luminance of many advertising signs (including OLDS) at night greatly exceeds the luminance control value established in the specifications and guidelines". They record that the United States, Europe, Australia, China and other countries have issued such guidelines, governing position, luminance, relationship to traffic signs and signals, area, dynamic requirements, screen content and closing time. The guidelines exist. They are exceeded.

What the experiment found, so far as the Foundation can read it

Twenty-four subjects viewed fourteen simulated night road scenes at the three screen luminances, in a darkened room, on a television at a viewing distance of 920 millimeters, and responded to small targets. Five thousand and forty reaction time measurements were obtained. Where the reaction time exceeded two thousand milliseconds or no response was made, the authors recorded the trial as a missing dot, treating it as a case in which the subject "did not see" the target and "the safety risk to driving was high".

The result reported in the abstract has two halves and the Foundation gives both. Colored light projected from these screens "can improve a driver's ability to recognise small targets and reduce RTs in the case of low WFL values, but the coloured light causes more MDs and affects traffic safety". So reaction time, measured on the targets that were seen, improved; and the number of targets not seen at all increased. The Foundation records the first half because it runs against the position this comment takes and because a measure that improves is not evidence of harm.

One exception is stated in the abstract and again in the fragment of the conclusions the publisher displays, and it is the finding the Foundation places before the Department. The improvement holds for the colors tested "in addition to blue light"; and of blue the conclusion states that "blue light can

increase RTs, i.e., worsen driving safety". The sentence is cut off in the preview at the following clause and the Foundation does not know what it says.

Taken at the weight the Foundation can give it, which is that of an abstract, that is a spectral finding on a driving safety endpoint: among the colors a large outdoor display can emit, the short-wavelength one is the one reported to lengthen the time a driver takes to respond. Part V.B.3 and Part V.F treat the spectral question generally, and Part VI.B.1 records the two sources finding that short-wavelength content increases discomfort while leaving disability glare to luminance. This is a third kind of effect again, and it is measured in milliseconds of response rather than in ratings.

A finding the Foundation does not use, and why

The abstract reports that the night recognition ability of female subjects under this exposure was better than that of male subjects. The Foundation does not rely on that finding. It rests on twenty-four subjects, the preview does not disclose how they were divided, and the comment already declines a sex-difference finding running in the opposite direction, reported at Appendix C.103 from a study of twelve subjects under fog. Two small studies reaching opposite conclusions on the same kind of question is the ordinary signature of samples too small to support either, and the Foundation treats both the same way.

The criterion measured against the products, and traced to the standard it was borrowed from

The preceding passages describe the American criterion from its own documents, record what happened when a road authority tried to apply it, and set out what typical screens emit according to field work in China. This passage does three things those could not. It reports luminance measured with a calibrated photometer on identified American signs at identified American addresses; it sets those measurements against every recommended value the literature contains; and it identifies the standard from which the American criterion was taken, which is not a roadway standard at all.

Wachtel J., Report on Digital Sign Brightness, prepared for the Nevada State Department of Transportation, Washoe County, the City of Reno and the City of Sparks, The Veridian Group, Inc., November 2014, described at Appendix C.114.

Three matters of provenance before its contents, each of which cuts against the weight the Foundation can give it. First, it is by the author of the review at Appendix C.113, so two of the sources in this subsection are the same person and the Foundation does not treat them as independent of one another. Second, the report states on its own face that the work was performed at the request of Scenic Nevada, which it records as having had no role other than providing maps of sign locations for the site visit. Scenic Nevada is an advocacy organization and the Foundation discloses that as plainly as it discloses the sponsorship of the industry report at Appendix D.4. Third, the report was prepared for a State department of transportation, a county and two cities, but it is a consultant's report and nothing in it shows that any of those bodies adopted it. The Foundation does not describe it as a Nevada standard and the Department should not read it as one.

What was measured

Nighttime luminance was measured on identified signs in Reno, Sparks and unincorporated Washoe County on 22 September and 18 October 2014, with daytime readings on 19 October, using a Minolta LS-100 calibrated photometer with a one degree acceptance angle. The appendices list each sign by number, location, jurisdiction, whether it is on-premise or off-premise, the message it was displaying, the number of meter readings taken and the average and range of those readings. The Foundation has read those tables.

The summary figures are these. On 22 September, sixteen traditional billboards averaged 59.8 candelas per square meter, with a range of 2.2 to 291, and seven LED billboards averaged 1,291, with a range of 107 to 5,390. On 18 October, eleven traditional billboards averaged 51.1, with a range of 2.1 to 240, and eight LED billboards averaged 1,318.2, with a range of 44 to 4,440. Three fixed

internally illuminated signs averaged 191.3. The report states that the digital signs measured in the two visits, taking billboards and on-premise signs together, averaged more than twenty-two times the traditional billboards measured on the same nights in the same county. The Foundation has checked that figure against the two pairs of averages and obtains between twenty-two and twenty-six times.

Two single readings are worth stating because they bound the range. The highest average recorded for any sign at night was 3,850 candelas per square meter, for an on-premise digital sign on South Virginia Street in Reno, with individual readings to 5,390. A digital billboard at a retail site on Interstate 395 averaged 1,961.9 with readings to 3,142, and the table carries a footnote the Foundation reproduces in full: “Messages on this sign were often too bright to be readable.”

The measurements against the recommended values

The report collects the luminance values that the technical literature recommends for these signs at night. The Foundation sets them out because the comparison is the point, and because the sources are not of one persuasion:

- Thirty candelas per square meter. A Federal Highway Administration study, reported at second hand through a municipal code review, concluded that “a brightness of 30 nits was sufficient to view the message on an electronic billboard at 650 feet at night and 1000 nits was sufficient during the day”.
- Thirty to seventy-five candelas per square meter. The model guidelines of Kuhn, Garvey and Pietrucha, prepared for the United States Sign Council, which is to say for the on-premise sign industry.
- About forty candelas per square meter as an appearance limit. Luginbuhl and others, reasoning from adaptation: drivers “should be subjected to brightness levels of no greater than 10 to 40 times the brightness level to which their eyes are adapted for the critical driving task”, and since roadway lighting and headlamps give about one candela per square meter, “this implies signage should appear no brighter than about 40 nits”. They recommend that the new technologies not exceed one hundred.
- Forty-five to one hundred and eleven candelas per square meter. The standard of the Illuminating Engineering Society of North America directly applicable to this product class, titled Recommended Luminances for Poster Panels, Painted Bulletins, and Other Advertising Signs.
- One hundred candelas per square meter. Freyssinier, Narendran and Bullough, who found that sign luminances of no more than that figure “were found to optimize legibility and acceptability, even when competing signs were present”.
- One hundred and fifty candelas per square meter at night. Carhart, for the Illinois Coalition for Responsible Outdoor Lighting, rising to two hundred where the limit is set by calibration against a full white display.
- One hundred in rural areas and one hundred and fifty in brightly lit urban areas. The recommendation of this report itself.

Against that range the measured averages of 1,291 and 1,318.2 are extraordinary, and the arithmetic that follows is the Foundation’s. They are about forty-four times the thirty candelas per square meter the Federal Highway Administration study found sufficient to read the message at six hundred and fifty feet. They are about thirty-three times the appearance limit Luginbuhl derives from adaptation. They are about thirteen times the hundred that three separate sources converge on, which is the comparison the report itself draws when it states that the digital signs “averaged 12-13 times the level recommended by the many experts cited in this report”. The highest single reading, 5,390, is one hundred and eighty times the thirty.

The Foundation draws the Department's attention to the convergence between this report and the field work at Appendix C.112. Those authors, working in China some six years later and wholly independently, identified the excessive luminances of typical screens at night as one thousand, three thousand and five thousand one hundred candelas per square meter. The measured averages here are 1,291 and 1,318.2 and the measured maximum is 5,390. Two sets of field measurements on two continents, by investigators with no connection to each other, arrive at the same floor and very nearly the same ceiling. The Foundation had recorded that the Chinese figures rest on an abstract it could not read in full; they are now corroborated by measurements it has read in full.

That the signs are not easier to read for being brighter

The report records two observations that the Foundation places before the Department because they dispose of the only justification ever offered for these luminances. Of the traditional billboards: "None of the traditional billboards measured in Washoe County presented any visibility or legibility concerns, even though several of these signs had luminance values below 5 cd/m2." And of the digitals: "One digital billboard in Washoe County measured only 44 cd/m2. Yet, there was no difficulty seeing or reading this sign."

The report states the general proposition in its list of consequences of excess sign luminance, and the Foundation adopts it: "Beyond certain luminance levels, brighter signs become more difficult to see and to read, thus defeating the advertiser's specific purpose". The sign whose messages were often too bright to be readable is that proposition measured. A product emitting at two thousand candelas per square meter is not doing its own job better than one emitting at forty-four. It is emitting more light into the eyes of everyone who passes for no gain to anybody, including its owner.

Where the American criterion came from, which is the finding the Foundation most wishes to place before the Department

Part VI.J.6 has described the only operative American brightness criterion for this product class, has recorded that it was developed under contract to the industry that sells the product, and has recorded at Appendix C.111 what happened when a road authority and a university optometry department tried to apply it. This report supplies the piece that was missing, which is where the number came from.

> "It is interesting to note that Lewin's methodology and his resultant recommendations are, in fact, based on a standard for light trespass rather than a standard relevant to roadways and driving."

The report identifies the source as a technical memorandum of the Illuminating Engineering Society of North America titled Light Trespass: Research, Results, and Recommendations. It then records that the same society already had in force a standard written for this very product class, Recommended Luminances for Poster Panels, Painted Bulletins, and Other Advertising Signs, which recommends illuminance levels "consistent with luminances of 45-111 nits". Following the trespass memorandum instead, the report states, billboards "could reasonably be expected to achieve luminance levels of 300-350 nits, a level some 3-6 times higher than is necessary or desirable for roadside advertising signs", and it concludes that the trespass standard "is the wrong standard to use when developing brightness criteria for signs to be viewed by road users".

The Foundation asks the Department to hold that beside two figures it has already derived by other routes. Its own arithmetic from the industry report at Appendix D.4 gives an implied luminance of about three hundred candelas per square meter. The optometry department at Appendix C.111 computed three hundred and twenty-two for the darkest ambient zone. This report reproduces the table in the industry document itself, which gives three hundred, three hundred and forty-two, three hundred and three hundred and thirty for the four standard billboard sizes. Three independent routes to the same number, and this report explains it: the number is what you get when you take a criterion written to stop light falling on a neighbor's window and apply it to a surface a driver has to look at.

Two further matters the report records about that criterion. It observes that having explained the merits of measuring illuminance, its author ultimately converts the illuminance readings into luminance values anyway, which the report describes as "begging the question of why the far simpler and more direct method of measuring luminance was not followed in the first place". And of the later industry measurement protocol, in which an assistant holds an opaque black sheet in front of the meter to block the sign, the report gives three reasons why it cannot work in the field and adds that "there seems to be no recognition or endorsement by Dr. Lewin of the proposed OAAA approach". The Foundation notes separately that the underlying industry document is cited in this report's reference list as undated.

That the industry is not of one mind, and that one half of it agrees with the Foundation

The comment has said at Part VI.J.6 that the American criterion is expressed in a quantity that does not govern what a person sees. It is worth recording that the on-premise sign industry says the same thing. The United States Sign Council, in its Model On-Premise Sign Code, states:

> "The USSC standard for the measurement of on-premise sign illumination is Luminance. Luminance measures light output at its source, does not vary with ambient light conditions, and further can be objectively measured both during the sign fabrication process and after installation in the field to ensure adherence to the illumination requirements of this model". And: "This Model Code strongly recommends that other light measurement methods be avoided in regard to on-premise signs (for instance, an illuminance standard, or including ambient lighting conditions as a part of a complicated formula), because these methods do not account for true sign brightness which, in regard to traffic safety, is the primary determinant as to whether a sign is visible and legible to the motorist".

That is one trade body rejecting, in terms, the measurement approach another trade body developed and promotes. The Foundation does not suggest that either position was arrived at disinterestedly. It places the division before the Department for a narrower purpose: the proposition that luminance is the quantity that governs what a road user sees, and that an ambient-dependent illuminance formula does not capture it, is not a contention of this Foundation against an industry. It is common ground between the Foundation, the independent researchers, the road authorities of three countries and one of the two American sign industries.

The report records one further thing about the on-premise industry's position which the Foundation states without comment, the facts being sufficient: that notwithstanding the thirty to seventy-five candelas per square meter its own commissioned consultants recommended, the sign council "continues to recommend a nighttime maximum luminance level of 750 cd/m2, a value more than ten times greater than their own consultants recommended".

A nineteen sixty-six finding on adaptation, and sixty years of nothing after it

The report quotes a study the Foundation had not encountered and which bears directly on Part V and on Part VI.B.1. Allen, Smith, Janson and Dyer, Sign Brightness in Relation to Legibility, a final report on a highway planning and research study conducted in cooperation with the United States Department of Commerce, Bureau of Public Roads, published by the Michigan State Highway Commission in 1966. Its finding, as quoted:

> "the data suggested that high-luminance signs can change the adaptation level of the eye (or the pupil size, or both). This finding suggests that the driver's vision would be impaired for other tasks requiring dark adaptation. It seems unwise to install unnecessarily bright signs that are unpleasant to the driver and may impair his vision"

The Foundation asks the Department to notice four things about that passage. It describes an effect on the eye rather than on behavior: a shift in adaptation level and possibly in pupil size, and consequent impairment of vision for tasks requiring dark adaptation. It is the same quantity, the adaptation level of the driver's eye, that Part VI.B.1 takes from the headlamp literature at Appendix

C.108, and the same mechanism. It was produced in cooperation with a federal agency. And it is sixty years old.

In those sixty years the luminances actually emitted by roadside signs have gone from the tens of candelas per square meter that floodlit billboards produce to the thousands measured in this report, and the Foundation has been unable to identify any federal health authority that has examined the question in the interval. A finding that bright signs may impair a driver's dark adaptation, made when the brightest signs were a fraction of what is now installed, has never been revisited by the agency that Congress charged with the biological effects of electronic product radiation.

The Foundation states the limits of what it has. It has not read the 1966 study; it has read a quotation from page thirty-three of it in this report. It does not know the size of the effect, the method by which it was obtained or the luminances at which it was observed.

Two further matters the report records

On malfunction. The report observes that digital displays, particularly those controlled remotely, are subject to failures that may be manifested in "display segments that appear to flash or scintillate", and recommends that any such failure produce an immediate conversion of the display to an off or all dark configuration until it is corrected. That is a flash-producing failure mode in a product of this size, and Part V.E.1 is the place in this comment where flashing is treated. The Foundation notes that no American instrument it has identified requires such a fail-safe.

On daytime output. The report states that manufacturers promote signs capable of eleven thousand candelas per square meter or higher, records a daytime measurement of 4,442.3 on a single digital sign, and recommends a daytime ceiling of three thousand. For comparison it gives the luminance of the sun as approximately six thousand five hundred. A product marketed on its capacity to approach the luminance of the daytime sky is a product whose optical output nobody has assessed for effect on the eye.

The source behind two of the findings above, now obtained, and what it adds

Two propositions in this subsection have rested on a critic's account of a document the Foundation had not read: the ratio of ten to forty times the adaptation level, and the origin of the American criterion in a light trespass standard. The Foundation has now obtained that document. It confirms both, and it supplies a third finding which the Foundation regards as the most serious thing it has to say about the American criterion.

Luginbuhl C.B., Israel H., Scowen P., Polakis J. and Polakis T., Digital LED Billboard Luminance Recommendations: How Bright Is Bright Enough?, 9 November 2010, described at Appendix C.117. The first author is of the United States Naval Observatory Flagstaff Station and the third of Arizona State University; the remaining authors are named without institutional affiliation. The Foundation states three things about its status at once. It is marked DRAFT on its face and the Foundation has found no final version. It is not a publication of the Naval Observatory or of any agency, and must not be represented as one. And its authors write from a concern with the darkness of the night sky, which is an interest, disclosed here as the Foundation discloses the sponsorship of the industry report at Appendix D.4 and the advocacy commission behind Appendix C.114.

The adaptation argument, in its own terms

The argument runs from a property of the eye rather than from a preference about signs, and the Foundation sets out the chain because each link is a published recommended practice of the same standards body whose figures the American criterion invokes.

The first link is asymmetry. The authors quote the ninth edition of the society's lighting handbook at page 3-9 to the effect that where a change in brightness lies within the range of the cone photoreceptors a few minutes suffices for adaptation, and that as to direction, "changes to a higher [brightness] can be achieved much more rapidly than changes to a lower [brightness]". The authors draw the consequence: the eye adapts quickly to the bright sign and slowly back to the dim roadway.

The comment has the same asymmetry measured in seconds at Appendix C.108, where readaptation after facing headlamps took a mean of 3.63 and 5.14 seconds.

The second link is the roadway. Design luminances for illuminated roadways are about one candela per square meter, varying from about 0.3 to 1.2 by road type. That is the level the driver's eye is adapted to, and it is the denominator of everything that follows.

The third link is the ratio the same society recommends for adjacent areas. Its recommended practice for exterior environments states that where roadways are lighted to a base level, adjacent areas "should be no brighter than ten times that level. Additional brightness will not attract more attention, and may present a hazard to motorists on adjacent roadways." Its practice for parking facilities sets a maximum to minimum range of fifteen to twenty to one, on the stated ground that a driver looking at the brightest spot in the field of view must still be able to detect an object in the dark areas of it. Its practice for merchandise areas states that luminance ratios "should not exceed 20:1", adding that "Increasing the lighting level does not add to merchandise attraction, and may create a hazard to motorists on adjacent roadways or a nuisance for neighbors."

From a twenty to one ceiling and a roadway at one candela per square meter the authors obtain twenty candelas per square meter as the maximum for a sign visible to drivers. They then record that the society's own recommended practice for roadway sign lighting gives twenty to eighty, and that the figure in the lighting handbook for poster panels, painted bulletins and other advertising signs is consistent with forty-five to one hundred and eleven. Their recommendation is that no sign visible from a roadway exceed one hundred candelas per square meter in an urban environment, and they say in terms that "it can be easily argued that this value is too high".

The contradiction inside the standard itself

The finding the Foundation asks the Department to read twice is this. The same lighting handbook, at page 17-26, carries a table titled Recommended Luminous Background Sign Luminances giving values between two hundred and fifty and one thousand four hundred candelas per square meter. The authors state the consequence:

> "These recommendations, if visible to highway drivers, will subject drivers' eyes to a brightness ratio of 250-1400:1. According to their own recommendations this ratio is unsupportable and will lead to compromised visibility and safety on public roadways."

And they add an observation about the structure of the document rather than about its numbers: "It is perhaps telling that nowhere in the discussion of recommended advertising sign brightnesses is transient adaptation or the vision of drivers mentioned."

One standards body, one handbook. In the sections on roadways, parking and merchandise it limits adjacent brightness to ten or twenty times the adaptation level because exceeding it may hazard motorists. In the section on advertising signs it recommends values up to fourteen hundred times the roadway, and in that section the vision of drivers is not discussed. The Foundation makes no allegation about why. It observes that this is what a subject looks like when no authority is charged with the biological question, which is the condition Part II of this comment describes.

What conventional billboards actually emit

The authors measured. Fifty-five floodlit billboards in the Phoenix metropolitan area in August and November 2009, and three in the Chicago area in November 2010, were measured on white surfaces with a Minolta LS-100 luminance meter, and the individual readings are tabulated by advertiser, city and cross street. The average was fifty-four candelas per square meter; fifty-two of the fifty-eight were at or below one hundred and fifty-six of the fifty-eight below one hundred and fifty. Separately, five hundred and ten billboard faces inventoried in the Tucson metropolitan area gave an estimated average of fifty-nine, with four hundred and twenty-four at or below one hundred and five hundred and two at or below one hundred and fifty.

The Foundation records the difference in method between those two sets, because the authors do. The Phoenix and Chicago figures are measurements. The Tucson figures are not: no direct luminance measures were made, and the values were deduced from lamp lumens and sign areas using assumed values for light loss factor, coefficient of utilization and surface reflectance, which the authors state. The comment relies on the measured set and reports the deduced set as corroborating it.

Those figures give the comparison its force. Conventional floodlit billboards, erected in most cases with no restriction on brightness and therefore illuminated to whatever the industry found satisfactory, run at about fifty to sixty candelas per square meter. The American criterion permits about three hundred. The products measured in Nevada at Appendix C.114 ran at about thirteen hundred. And the authors note that digital billboard products on the market in 2010 commonly advertised maximum luminances between six thousand five hundred and seven thousand five hundred.

What the criterion was built on, which is the finding of first importance

The authors describe the industry report precisely: a method based ultimately on considerations of light trespass as developed in the society's technical memorandum TM-11-00, using a footcandle meter at five feet, between one hundred and fifty and three hundred and fifty feet from the sign depending on its size, comparing the reading with the sign on against the reading with it off, and treating a difference of 0.3 footcandles or less as acceptable. They then state what that permits, and the Foundation notes that this is a fourth independent arrival at the same number: "the report indicates that this method effectively limits the luminance of signage to 300-350 nits."

Then the conceptual objection. The authors examined what the trespass memorandum actually measured, and report that a group of observers was shown brightly illuminated panels, of two thousand to seven thousand five hundred candelas per square meter, and asked to judge whether they seemed too bright. The critical sentence:

> "the observers were asked only to rate how 'objectionable' they found the illuminated panels to appear; no evaluation of visual performance - the ability to see objects or read signs - was attempted."

The authors state the error that follows and the Foundation adopts the statement: the approach "has confused lighting that has been judged to cause an acceptable level of light trespass or even just an 'objectionable' sensation with the much more vital issue of sign lighting that compromises the vision and therefore safety of drivers. The ability to see and light trespass/objectionability are essentially unrelated."

And then the sentence that the Foundation places above every other quotation in this Part, because it is the industry report convicting itself out of its own mouth:

> "The OAAA report recognizes this, stating 'Digital billboards are not the form of lighting that TM-11-00 was developed to limit.' Yet the OAAA report does just that."

If that is accurate, and the Foundation has flagged below that it must be verified in the industry report itself, then the only operative American brightness criterion for this product class was derived from an instrument which the criterion's own author acknowledged was not developed to limit this kind of lighting, resting on a study that measured whether people found panels objectionable and never measured whether anyone could see. The Foundation has argued throughout Part VI.J that the criterion is expressed in the wrong quantity. This is the further and graver point: the underlying evidence was never about vision at all.

The authors close with the proposition the Foundation asks the Department to carry into its own consideration of this product class: "Transient adaptation, and not light trespass, or 'objectionability,' is the overriding concern for public safety with regard to the brightness of signage." Transient adaptation is a property of the human eye. It is measured in Appendix C.108 in

seconds, reported in Appendix C.114 from a federally cooperative study of 1966, and it is the endpoint on which this subsection, the headlamp subsection at Part VI.B.1 and the roadway subsection at Part VI.D all converge.

The industry report read against the criticism of it

The Foundation has the industry report. It is at Appendix D.4 and the comment has quoted its exclusion clause, reproduced its measured luminance table and computed with its equation A5 since this Part was first drafted. It has now been re-read in full against the criticism set out above, and this passage records what that comparison establishes. Every quotation below is from the report itself.

The sentence verified

The most serious charge in the preceding passage was that the report applies an instrument its own author acknowledged was not made for this purpose. That charge is made out. At section A3.1 the report states:

> "Digital billboards are not the form of lighting that TM-11-00 was developed to limit. In fact, digital billboards are specifically intended to be seen over a wide area, much of which may be remote from the billboard itself. Nevertheless, the principles of TM-11-00, in terms of the calculation method and the limits it provides, can be examined to determine whether the methodology can form a useful method of specifying billboard luminance limits."

The Foundation gives the whole passage, including the sentence beginning Nevertheless, because the criticism quoted only the first sentence and the third is the author's reason for proceeding. He did not overlook the objection. He stated it, and went on, on the ground that the calculation method and the limits could still be useful. The Foundation does not suggest concealment. It says that an acknowledged mismatch between an instrument and its application is a matter for the body adopting the criterion to weigh, and that no federal health authority has ever weighed it.

What the criterion is calibrated to, in the report's own words

The preceding passage asserted that the underlying research measured objectionability rather than visual performance. The report confirms it twice, without being asked. At section A3.7, of the limits it borrows: they "are realistic and prevent undue annoyance to a majority of viewers, and thus appear to have formed a satisfactory basis for specifying such lighting limits." And at the close of Section A:

> "Because these values have been derived from IESNA publication TM-11-00, which in turn is based on an extensive human factors research project, adoption of such values should satisfy the requirement that most persons will not find these billboard luminances to be objectionable."

The requirement the criterion is designed to satisfy is that most persons will not find the luminance objectionable. That is the standard on its face, stated by its author. It is a standard about annoyance. It is not a standard about whether a driver can see, and it is not a standard about the eye.

That the glare method was considered and set aside

The report did not overlook driver glare. It examined it first, as its Method 1, built on the roadway lighting standard, and then declined it. The five reasons given are set out in the report and the Foundation characterizes them fairly: that the roadway standard has fourteen classifications; that a billboard is visible from many vantage points so the applicable class is unclear; that glare depends on distance and the viewing distance varies; that glare depends on the angle from the line of sight, which changes as the driver moves; and that the extent of glare depends on billboard size. The conclusion drawn from them is administrative:

> "because of all the variables involved, the establishing of realistic billboard luminance limits based on the RP-8-00 methodology would be exceedingly complex. Even if simplifications were introduced, there would be problems in deciding which luminance limit would be

> applicable to a given billboard. Checking and enforcement similarly would be highly problematic. For these reasons, Lighting Sciences Inc. has not developed and is not recommending a billboard luminance specification system based upon glare limitations."

Every one of those five reasons is true, and every one of them is a reason why the quantity is hard to administer rather than a reason why it does not matter. The Foundation asks the Department to notice what the passage concedes by its structure: that a specification addressed to driver glare was the first approach considered, that it was rejected for complexity and enforceability, and that the simpler instrument adopted in its place was one the report elsewhere says was not developed for this kind of lighting. Difficulty of measurement is a reason to fund measurement. In the hands of a body with no health mandate it became a reason to measure something else.

The report also records a gap in terms, and the Foundation adopts the sentence: that while a single billboard at these levels is unlikely to produce significant glare, "Situations where a multiplicity of such billboards appear in the driver's field of view simultaneously require further research." That research has not been identified by the Foundation as having been done, and the trade guidance at Part VI.J.6 reports that American practice permits two or three such displays in the field of view at once.

The dimming table, which quantifies what compliance consists of

The report measured one display and then computed what it must be dimmed to in order to meet the criterion. The Foundation reproduces the result because it is the most economical statement in this Part of a proposition the comment has advanced throughout. For the four standard sizes the required settings are 4.3, 4.9, 4.3 and 4.7 percent of full output. The report states the arithmetic for the medium size: an allowable 342 candelas per square meter against a measured 7,000 at full power, giving 4.9 percent. It later assumes, in its sky glow calculations, that a fourteen by forty-eight foot display "would be operated at 4.3% of full output at night, as recommended in table 4 above".

A product that complies with the only operative American brightness criterion is a product turned down to about one twentieth of what it can emit. The other ninety-five percent remains in the device, available at any time, reachable by a controller setting. The report confirms the setting governs the output, recording that measured luminance reduction "accurately corresponded to within a few percent of the dimming settings indicated on the controller". Part VI.J.6 has said that compliance with this criterion is a setting rather than a property of the product. The report says the same thing in a table, and puts a number on it.

The comparison the report draws, and the figure it draws it against

The report concludes Section B by comparing its recommended levels with conventional billboards, and the Foundation examines the comparison because it is the report's principal reassurance. It cites a technical memorandum of the Lighting Research Center at Rensselaer Polytechnic Institute, Evaluation of Billboard Luminances, dated 31 March 2008 and sponsored by the New York State Department of Transportation, for the proposition that "it is probably reasonable to expect that the luminance of a conventional billboard would not be likely to exceed about 280 cd/sq.m. during the nighttime". From that it concludes that digital billboards at its recommended 300 to 342 "will be brighter, but only slightly brighter, than the maximum luminance of conventional billboards."

The arithmetic is correct and the comparison is not, and the Foundation can now show why because it has the measurements. The 280 figure is an upper bound: what a conventional billboard would not be likely to exceed. It is not what conventional billboards emit. Two independent sets of field measurements set out earlier in this subsection answer that question. Fifty-eight floodlit billboards measured in Phoenix and Chicago averaged fifty-four candelas per square meter, and twenty-seven measured in Washoe County, Nevada averaged between fifty-one and sixty. Against the figure that conventional billboards actually reach, a limit of 300 to 342 is not slightly brighter. It is about six times brighter, and the arithmetic is the Foundation's from the measurements at Appendices C.114 and C.117.

The Foundation states the limits of that criticism. Comparing a proposed maximum with a measured maximum is a defensible thing to do, and the report says plainly which figure it is using. The Rensselaer memorandum, which the Foundation has not obtained, may well support the 280. What the Foundation contends is narrower: that a reader of this report alone would take from it that the recommended levels sit close to existing practice, and that the measurements show existing practice to be some six times lower. The comparison that would have shown this is one no party to the report had any reason to draw.

The instruments the 2013 brief reached for are both borrowed. One is broadcast guidance addressed to television and disclaimed for billboards. The other is a photobiological screening threshold whose effect is to end the inquiry. Neither was made for this product, and between them they are the whole of what a public health body examining this class had available.

7. A measured cost of attention capture, and the limits of what it shows

Everything above in this subsection concerns the optical output of the product. This paragraph concerns something else, and the Foundation separates it carefully because the distinction is the whole of its honesty. There exists one rigorous causal study of the effect of this product class on crashes, and it is not a study of emission. It is a study of what the display says.

The study is described at Appendix C.97. A State transportation department displayed the year-to-date count of statewide road fatalities on its dynamic message signs for one week in each month, the week before its monthly board meeting, beginning in August 2012. The authors used that schedule as a natural experiment, with data on 880 signs and every crash in the State between 1 January 2010 and 31 December 2017, holding fixed the road segment, the year, the month, the day of the week and the time of day, and running placebo tests on weeks before the campaign began and on road upstream of the signs.

What they found is stated in their own structured abstract:

> "Contrary to policy-makers' expectations, we found that displaying fatality messages increases the number of traffic crashes. Campaign weeks realize a 1.52% increase in crashes within 5 km of DMSs, slightly diminishing to a 1.35% increase over the 10 km after DMSs. We used instrumental variables to recover the effect of displaying a fatality message and document a significant 4.5% increase in the number of crashes over 10 km."

They give two calibrations. The effect is "comparable to raising the speed limit by 3 to 5 miles per hour or reducing the number of highway troopers by 6 to 14%". And, on their own description a back-of-the-envelope calculation, the campaign "causes an additional 2600 crashes and 16 fatalities per year in Texas alone, with a social cost of $377 million per year".

Their account of the mechanism is attentional, and the supporting pattern is specific. The messages, in their words, are "'in-your-face,' 'sobering,' negatively framed messages" which "seize too much attention (i.e., are too salient), interfering with drivers' ability to respond to changes in traffic conditions". In support they report that a higher displayed count causes more crashes than a lower one, that the effect is worse on more complex road segments, that it falls with distance from the sign, and that the messages "increase multi-vehicle crashes (but not single-vehicle crashes)". They set out seven alternative explanations and give evidence inconsistent with each.

What this study does not show, stated before what it does

It is not evidence that the emission of a dynamic message sign causes crashes, and the comment does not offer it as such. The signs were already in place and operating in both conditions; the abstract says so, describing the campaign as displaying counts on "previously installed highway dynamic message signs". The luminance, the spectral content, the refresh behavior and the physical presence of the sign were identical in treated and untreated weeks. The design holds the emission fixed and varies the message. Nothing in it bears on the quantities that the rest of this subsection, and the rest of this comment, are about.

What it does show, which is a premise the whole of Part VI rests on

Every device in Part VI that exists to be noticed — the warning beacon, the emergency lamp, the deterrent strobe, the message sign — is deployed on an unstated premise: that capturing more of a person's attention is better, and that a device which captures more attention is therefore safer. The Foundation has not found that premise examined anywhere in the regulatory material described in Part II or Part IV. It is simply assumed.

This study is a measurement of it, in the one case where somebody thought to measure. The authors state the general finding in terms: behavioral interventions "can be too salient, crowding out more essential considerations and causing the intervention to backfire with costly consequences". A device designed to seize attention does seize it, and the attention comes from somewhere. On a road, it comes from the driving task.

The Foundation is explicit about the status of the extension it draws. The measured instance is message content. Whether a high-luminance flashing lamp imposes an attentional cost of the same kind is not established by this study and the Foundation does not assert that it is. What the study establishes is that the premise is not self-evidently true, that it is measurable, that in the one case measured it was false, and that the cost of being wrong was calculated at hundreds of millions of dollars and sixteen lives a year in one State. That is a reason to measure, which is what paragraphs 360ii(a)(4) and (a)(5) direct.

Two further findings that answer objections this comment habitually meets

The first is habituation. The commonest answer to any complaint about an intrusive light is that people become used to it. The authors report the opposite for an attention-capturing roadside stimulus observed over five years, stating as one of their five lessons that "individuals don't necessarily habituate to behavioral interventions, even after years of treatment". The second is that the effects "do not necessarily persist after treatment stops", which is to say the harm ended when the practice ended.

The regulatory finding, which is the reason this appears in a comment to this Department

The campaign was not an aberration of one State. The authors record that it "has been implemented in 28 US states". These are devices and messages governed by the Manual on Uniform Traffic Control Devices, published by the agency which told the Foundation, in the letter quoted at Part II.H.6, that the health effects of light-emitting diode devices extend beyond its authority. No one was required to evaluate whether this intervention worked or what it cost. It ran for years in more than half the States. The evaluation was eventually performed by two economists and published in a general science journal, and it found harm.

The authors drew the same conclusion the Foundation draws, and the Foundation adopts their words rather than its own: "it is important to measure an intervention's effect, even for simple interventions, because good intentions do not necessarily imply good outcomes".

The same cost measured directly, in seconds taken from the driver

The study above infers the cost of attention capture from crash counts. There exists a second measurement of the same cost, taken the other way round: by tracking where drivers actually looked, for how long, and what was in front of them while they looked. The Foundation has the full text of that study and sets it out here because the two methods agree and because the second supplies a unit.

Herrstedt L., Greibe P. and Andersson P.K., Driver attention is captured by roadside advertising signs, 16th Road Safety on Four Continents Conference, Beijing, 15 to 17 May 2013, by the Danish consultancy Trafitec, described at Appendix C.115. The review at Appendix C.113 records that an independent reviewer considered this the best designed and conducted on-road study in the field.

The limitation that governs everything below

The Foundation states it before the findings because it is decisive for the use that can be made of them. The empirical part of this study measured one hundred and nine drive pasts of sixteen conventional static roadside advertising signs on Danish rural main roads, selected as the most striking such signs by Danish standards. They are painted and printed boards. The study measured no digital display, no electronic sign and no light-emitting product of any kind in its empirical part, and it reports no optical quantity whatever: no luminance, no illuminance, no spectral content, no modulation. Its endpoints are where the eye went, for how long, at what angle, and what was in front of the car at the time.

What it measured

Thirty-two drivers aged between twenty-three and seventy, men and women, drove an instrumented car on four routes in three regions of Denmark, by day and outside peak hours, without being told the purpose of the drive. The car carried a three-camera eye-tracking system sampling head and eye position sixty times a second, a scene camera, satellite positioning for speed, and a laser scanner measuring the distance to vehicles ahead across about fifty degrees either side at a range of eighty to one hundred and twenty meters. Two hundred and thirty-three glances at the sixteen signs were recorded.

That the signs took the attention

In sixty-nine percent of the drive pasts the driver was tracked glancing at the sign at least once, and in almost half of all drive pasts twice or more at the same sign. Most glances were short: fifty-six percent lasted under half a second. But eighteen percent of the tracked glances lasted one second or longer, and for more than twenty-two percent of the drive pasts the total duration of successive glances at the same sign reached two seconds or more, with ten percent reaching three seconds or more. The horizontal angle of the glance reached forty-five degrees in some cases; forty-eight of the two hundred and thirty-three glances, twenty-one percent, fell outside what the authors define as the normal range of road users' visual behavior on rural roads, by the combination of angle and duration. The authors note that the wider the angle, the longer the driver needs to bring attention back to the road ahead.

The unit, which is what this study contributes

The authors construct a quantity they call the safety buffer, and the Foundation adopts it because it expresses the cost of a glance in the only currency that matters to the person in front. It is the time gap to the vehicle ahead, in seconds, minus the duration of the glance away from the road:

$$T\,(\text{sec.}) = l\,(\text{sec.}) - t\,(\text{sec.})$$

Where T is the safety buffer, l the time gap to the driver ahead and t the advertising glance duration. Their worked example is a time gap of 1.1 seconds and a glance of 0.60 seconds, leaving a buffer of 0.5 seconds. That remainder is, in their words, the maximum time the driver has to perceive, interpret and respond to a sudden incident after bringing the eyes back from the sign.

The Foundation asks the Department to attend to what that formulation does. It converts an act of looking at an advertisement into a quantity of response time removed from the driver, and it makes the cost additive with whatever else is consuming the same budget. A device that holds the eye for six tenths of a second takes six tenths of a second from every driver behind whom a car is following too closely, whether or not anything happens in that interval.

What the buffer came to

Of the two hundred and thirty-three glances, a vehicle was present ahead within a time gap of under three seconds in sixty-five. In fifty-nine of those the safety buffer was less than two seconds, and for twenty percent of all advertising glances it was below 1.5 seconds. Two glances produced a buffer below zero, which is to say that the driver looked at the advertisement for longer than the entire gap to the car in front.

The arithmetic the Foundation adds is the ratio within the estimable cases, and the authors do not state it. Fifty-nine of sixty-five is about ninety-one percent. Where a vehicle was close enough ahead for the buffer to be calculated at all, nine glances in ten left the driver under two seconds to react. The authors' own summary states the figure the other way, as a quarter of all tracked glances, because they divide by every glance including the seventy-two percent taken with no vehicle ahead. Both statements are true of the same table and the Foundation gives both.

And the threshold it is measured against

The two second figure is not arbitrary. It comes from the hundred-car naturalistic driving study of the Virginia Tech Transportation Institute and the National Highway Traffic Safety Administration, which this study cites and which the Foundation records as a federal product. In that data, looking away from the road at driving-irrelevant stimuli for a total of at least two seconds within any six second period almost doubles the risk of being involved in a crash or near-crash. The same study measured, in the six seconds before the event, a cumulative average of 1.8 seconds of eyes away for crashes and 1.25 seconds for near-crashes, against 0.85 seconds for baseline driving.

Measured against that threshold, seventeen of the one hundred and nine drive pasts in this study met the definition of visual distraction — more than one drive past in six. Those seventeen were spread across eleven of the thirty-two test drivers and eight of the sixteen signs, which is to say across about a third of the drivers and half the signs. The authors draw the conclusion the Foundation would draw: the effect "seems to apply to a substantial part of all road users and is not concentrated on a single – or few – persons".

Their overall conclusion is stated in the abstract and the Foundation quotes it exactly: "The overall results of the empirical studies show that advertising signs do affect driver attention to the extent that road safety is compromised."

What this does to the Foundation's own argument, which is not all favorable

The Foundation will not leave the obvious inference to be drawn against it later. The signs measured here emit no light of their own. They are painted boards lit by the sun. If conventional static signs capture attention to the extent that road safety is compromised, then attention capture is not a property peculiar to light-emitting products, and nothing in this study shows that an LED display does anything a large painted board does not.

That is the correct reading and the Foundation adopts it. It sharpens rather than weakens what this comment actually claims. The Foundation does not contend that the Department should regulate these products because they are distracting; distraction is the business of the agencies named in Part II.H.6 and the Foundation says so at Part VI.J.6. What it contends is that these products emit optical radiation at luminances measured in the thousands of candelas per square meter, with spectral content and temporal modulation that no federal health authority has examined, and that those are properties of the emission rather than of the message. The studies in the review at Appendix C.113 that compared the two found the digital signs worse than the static ones on every behavioral measure. This study establishes the floor beneath that comparison: that even the version with no emission at all already takes measurable time from the driver.

The same measurement on electronic signs, by the road administration that then removed them

The study above measured painted boards. There is a companion to it which measured electronic ones, on a motorway, by day and by night, and it is the most two-sided source in this Part. The Foundation sets out what it found against this comment as fully as what it found for it, and places the adverse findings first among the results.

Dukic T., Ahlström C., Patten C., Kettwich C. and Kircher K., Effects of electronic billboards on driver distraction, Traffic Injury Prevention, volume 14 (2013), pages 469 to 476, described at Appendix C.116. The first, second, third and fifth authors are of the Swedish National Road and

Transport Research Institute; the fourth is of the Light Technology Institute of the Karlsruhe Institute of Technology. The research was funded by the Swedish Transport Administration, which is to say by the road authority itself and not by any party to the dispute about these products.

The occasion for the study is the part the Foundation asks the Department to notice first. Sweden had not permitted roadside electronic billboards at all. In 2009 the administration gave temporary permission for twelve, of which eight were installed, on a four-lane motorway through central Stockholm, and made the trial period subject to a road traffic safety evaluation in which driver distraction was of particular interest. The product was admitted provisionally, for measurement, with the question open. That is the opposite of the American position described at Part VI.J.6, where the product was admitted generally and the criterion came afterward from the industry that sells it.

What was measured

Forty-one drivers, mean age forty-two, drove an instrumented Volvo on a forty kilometer route in the autumn of 2010 wearing a head-mounted eye tracker sampling at fifty hertz, twenty of them between nine in the morning and three in the afternoon and twenty-one between half past six and half past nine in the evening. Four electronic billboards were studied against seven conventional signs on the same stretches, being three overhead gantries, two guide signs and one bus lane sign, together with one large static paper billboard. The participants were not told the purpose of the experiment until afterward. The billboards changed message every seven seconds, so each driver saw three or four advertisements while approaching one. The authors record the optical difference between the two classes in one sentence: "The billboards are lit, while the other signs are retroreflective, which most likely makes the billboards brighter."

What this study found against the Foundation's position

Four findings, and the Foundation states them without qualification before it states anything in its favor.

- The authors' own conclusion is that the safety question is open. "Whether they attract attention too much, that is, whether they are a traffic safety hazard, cannot be answered conclusively based on the present data." The Foundation does not represent this study as showing that these products are hazardous, because its authors expressly decline to say so.
- No effect on driving was found. There were "no consistent significant changes in driving behaviour with respect to speed, lateral placement of the vehicle or headway" between the stretches before, at and after a billboard.
- No difference was found between day and night on any visual behavior measure, and the authors draw an inference from that which is adverse to this comment. Drivers "did not avoid looking at the billboards at night-time more than during daytime, indicating that the brightness was not so high as to cause considerable glare".
- The accompanying crash analysis found nothing. The larger Swedish investigation of which this formed part examined accident statistics from 2003 to March 2011 and, in the authors' words, "no significant differences were found that could be attributed to the billboards when comparing before and after their installation".

The third of those bears directly on the central contention of this Part and the Foundation addresses it rather than passing over it. The inference is a reasonable one and the Foundation does not call it wrong. It records what it rests on, which the authors state in the sentence immediately before: "Unfortunately we did not have the opportunity to measure the luminance of the electronic billboards." The conclusion that brightness was not high enough to cause considerable glare is therefore an inference from the absence of a behavioral difference, not a finding from photometry, in a study whose authors identified the missing photometry as a limitation. That is the same structure the Foundation identifies at Part VI.J.4 in the public health brief and at Part V.K.3 in the 2018 Opinion: a conclusion about optical output reached without measuring the optical output. The

Foundation makes the observation about the state of the evidence and not about these authors, who said plainly what they had not done.

A fifth point belongs here too, because it cuts against the mechanism this comment has taken from other sources. The authors note that "a substantial number of drivers did not look at the billboards at all, which is a strong indication that they actually can be" ignored. If capture were wholly involuntary that would not be so. The Foundation accordingly does not assert that attention capture by these displays is irresistible, and Part VI.J.6 should be read subject to this.

What it found that supports the Foundation

On the visual measures the differences were significant and they were all in one direction. Significantly more participants looked at the billboards than at the other signs. When they did, dwell times were longer, the number of fixations was greater, and the maximum fixation duration was longer, each at the conventional level of significance. No significant effect was found on visual time sharing.

The concentration of the long glances is the finding the Foundation regards as most telling, because it concerns the tail rather than the average. Six fixations across the four electronic billboards lasted more than two seconds, ranging from 2.1 to 3.5 seconds, spread across different drivers and across all but one of the billboards. Across the seven conventional signs such a fixation occurred once in total. The authors put it in a single sentence: "Note that all cases where the visual time sharing intensity exceeds the threshold belong to the electronic advertising billboard group." Six of the seven glances exceeding two seconds were at the electronic billboards, and in four of those six the level of glance diversion reached the threshold the authors take from the naturalistic driving literature.

The Foundation notes what that means for the sample. The authors describe their participants as "a best case scenario", being middle-aged experienced drivers familiar with the road, and record why: "both novice and older drivers have been found to be more affected by electronic billboards", older drivers having "deteriorated physiological abilities" and being "more prone to suffer from glare". The result above is what the product does to the drivers least affected by it.

The mechanism, stated as a mechanism

The authors adopt the two-dimensional framework of Trick and Enns and apply it to this product class in terms the Foundation asks the Department to read closely:

> "In the context of electronic billboards, the mechanism that has the greatest influence on the driver is reflexive attention selection (automatic/bottom-up). Reflexive responses cannot be disengaged and at best the negative effects can be minimised by intentional inhibition."

Read with the finding two paragraphs above that a substantial number of drivers did not look at all, the claim is narrower than it first appears: the reflexive component cannot be disengaged, but a person may inhibit what follows from it at a cost in effort. That is a description of a stimulus which imposes a load whether or not the person yields to it, and it is the proposition this comment advances about this class of emission. The authors state it in a peer-reviewed journal, on the authority of a published framework, about electronic displays specifically.

The seven second cycle, and where it came from

Part VI.J.6 records a dwell time of eight seconds described in a trade article as accepted by the industry, and records at Appendix C.113 that the most recent on-road study says that figure is too short. This study shows how such a number is arrived at. The seven second cycle used on these billboards was, in the authors' words, "a compromise between traffic safety demands and requests from the billboard owners", specified by the road administration "based on trial and error followed by further refinements after complaints from the public".

One of those refinements is a measured temporal effect and the Foundation records it because no instrument it has identified addresses the phenomenon. The displays originally blanked between messages. That "was found to cause distraction since drivers said that they couldn't help waiting for the next message to appear", and the transition was altered so that one advertisement followed directly after another. A driver held by the anticipation of a change he has learned to expect is being acted on by the temporal structure of the emission rather than by its content, which is the subject of Part V.E.

What the road authority did about it

The study closes with the regulatory outcome, and the Foundation quotes the sentence in full because the attribution matters: "Based on the results reported here, along with results from the other studies, the Swedish authorities decided not to extend the test period and to remove the billboards under investigation."

The Foundation is careful about what that does and does not show. The decision is attributed to this study together with others, not to this study alone, and one of those others was an unpublished questionnaire which the authors report "showed that glare and visual clutter was seen as a problem". The Foundation has not seen that questionnaire and does not rely on it. Nor does it suggest that the Department should reach the conclusion a Swedish authority reached, on a Swedish motorway, under a different statute.

What the sequence shows is a method. A road authority declined to permit the product generally; permitted a small number provisionally; funded measurement by its own research institute; published the measurement including the findings that cut against restriction; and then decided. The Foundation asks the Department to compare that with the position Part VI.J.6 describes, in which the only operative American criterion for the same product class was written under contract to the industry that sells it, borrowed from a standard for light trespass, and has never been tested by any federal health authority at all. The Foundation does not ask the Department to ban anything. It asks for the step the Swedish authority took first, which was to measure.

8. What the Foundation asks as to this class

That the luminance of the emitting surface of representative outdoor light-emitting diode displays be measured as installed, at night, and in the directions in which dwellings lie, and that the measurement be of the product rather than of the illuminance it produces at a property line. Part IX.C.

That the temporal characteristics of the content be characterized — transition rate, luminance step and depth of modulation — and evaluated against the flash-rate material at Part V.E.1, given that a numerical criterion for this exact risk exists in broadcast guidance and does not reach this product.

That the conditions of exposure of residents be studied under paragraph 360ii(a)(4), which for this class means the exposure received inside a dwelling, at night, from a source the occupant cannot switch off.

That any limit the Department may prescribe not be expressed as a setback distance. For a source of these dimensions a setback does not reduce the intensity of retinal exposure within several kilometers, for the reasons given at paragraph 3 and at Part V.B.2.e, and a requirement framed in distance would appear to address the hazard without doing so.

K. Decorative, Architectural, and Entertainment Lighting

This class is treated briefly, and the Foundation says why at the outset. Entertainment and architectural lighting differs from every other class in Part VI in that the exposure is in large part sought: a person buys a ticket to a concert knowing there will be stage lighting. The Foundation

does not ask the Department to regulate a light show, and nothing in this subsection should be read as asking for that.

Three features nonetheless bring the class within the scope of this comment, and the third is the reason it appears at all.

1. What the products are, and the two exposures they create

Stage and effect lighting at concerts, festivals and clubs; strobes, moving heads, wash and beam fixtures and laser effects; architectural facade and feature lighting on buildings and structures; and decorative installations in public and commercial space. All are now predominantly light-emitting diode, and effect fixtures in particular are operated in modes of deliberate temporal modulation at frequencies and depths chosen for effect rather than constrained by any criterion.

The first exposure is the audience, which is voluntary in the ordinary sense and which the Foundation does not press. The second is not. Architectural and decorative installations are directed at public space and are seen by people passing, and festival and venue lighting is seen by people living beside the site and by workers whose employment requires them to be present for the duration. A person employed at a venue is exposed for a shift, repeatedly, by occupational necessity, and does not choose the programming. Part V.H treats occupational exposure generally and the Foundation records here that this class is among the most intense occupational optical exposures it is aware of, and among the least studied.

2. What is known

This class has one study behind it that no other class in Part VI can match, and the Foundation puts it first. It is a cohort study of 400,343 people, described at Appendix C.99, and it is the only population evidence in this comment that a stroboscopic exposure in public space is associated with a measured increase in a diagnosed clinical outcome.

Twenty-eight electronic dance music festivals in the Netherlands in 2015 were divided by the condition under which they took place. Festivals held in darkness, indoors or at night, were treated as exposed; those held in daylight were treated as unexposed. All of them used stroboscopic lighting. The exposed group comprised 241,543 people and 2,222,196 person hours; the unexposed 158,800 people and 2,334,360 person hours. On-site medical staff recorded thirty seizures in the exposed group and nine in the unexposed.

The incidence density ratio was 3.5, with a 95 percent confidence interval of 1.7 to 7.8 and p less than 0.0005. The authors conclude that stroboscopic light effects at such events held in darkness “probably more than triple the risk of epileptic seizures”.

The study is accompanied by a case. A twenty-year-old man had a tonic-clonic seizure at an indoor festival. At a later examination after sleep deprivation, stroboscopic stimulation “throughout the 14–25 Hz range elicited generalised epileptiform discharges”, and the same discharges and sensations occurred when he was shown phone video of the concert he had attended.

The variable that distinguishes the two groups, which is the reason this study matters beyond its own subject

The exposure contrast is not intensity. It is darkness. The same kind of event, with the same kind of lighting, attracting the same audience, produced three and a half times the seizure incidence when it took place against a dark background rather than in daylight.

That is the proposition this comment advances throughout Part V and has nowhere else been able to support with population data. Part V.C.3 sets out why a dark-adapted eye receives a flash differently from a light-adapted one. Part V.D.1 records that the instruments built to measure modulation require about one hundred lux to resolve a signal and that the stroboscopic metric is stated by its own authors not to be applicable in dark environments or with outdoor lighting. Part VI.I reports a lamp measured against a suburban background luminance of 0.3 candelas per

square meter. Every product class in Part VI that operates after dark operates in the condition this study identifies as the one that differs.

The Foundation does not extend the finding to those products. The study concerns concert lighting and its authors say expressly that the results may be less applicable to other kinds of event. What it establishes is that the state of adaptation of the viewer is not a theoretical refinement of the criteria discussed in Part V. It is a variable large enough to move a clinical incidence rate by a factor of three and a half in a cohort of four hundred thousand people.

What the study does not contain, stated before the lesser evidence

No photometry of any kind. No luminance, no measured flash rate, no modulation depth, no spectral data, and no measurement of any fixture at any venue. The exposure variable is whether the event occurred in darkness. The authors also concede that sleep deprivation, exertion and stimulant use cannot be fully separated from the lighting, writing that stroboscopic effects are "prime suspects, but probably not solely responsible" for the increase, and seizures were identified by on-site staff from witness reports rather than by confirmed diagnosis. The Foundation does not cite this study for any proposition about intensity.

A second and much weaker study addresses what attendees report. It is described at Appendix C.95 and it is a survey. Two hundred and six people in Portugal were asked about their experience of lighting at summer festivals between June and September 2024. Of those, 14.3 percent reported high sensitivity to stage lighting and 23.4 percent moderate sensitivity. Asked what would improve visual comfort, 44.81 percent favored higher-quality light-emitting diode systems, 37.66 percent designated areas of low light for visual rest, and 31.82 percent minimizing the use of intermittent lighting. Of the stage lights themselves, 20.13 percent found them uncomfortable.

The Foundation presents that as what it is: self-report from a small sample in one country, cross-sectional, with the authors' own statement that the design does not permit inference of causation and that the margin of error is 6.8 percent. It is not a measurement of anything, and the paper reports no photometry of any fixture at any event.

Those two studies are the evidentiary record the Foundation has been able to assemble for a class of product operated at deliberate high modulation in front of audiences numbered in the tens of thousands. Between them they establish that the exposure is associated with a measured increase in seizures when it occurs in darkness, and that a substantial minority of attendees report discomfort. Neither contains a single photometric measurement of a single fixture, which is the condition this comment describes for every product class in Part VI.

3. Why the class matters to this Department despite the voluntary character of the principal exposure

Because it is the clearest case in Part VI of deliberate modulation at frequencies and depths selected for aesthetic effect, with no criterion of any kind constraining the selection. Part V.D establishes that the recommended practice addressing modulation sets a seizure-prevention goal below 90 hertz, and Part VI.I establishes what a real product does against it. An effect fixture programmed to strobe is doing deliberately, and at the operator's choice of rate, what that practice addresses. No federal instrument reaches it. No American broadcast or venue rule reaches it either: the expert working group convened by the Epilepsy Foundation records that several countries, but none in North America, require television programs and advertising to meet guidelines for reducing the risk of visually provoked seizures, and that there is no provision in United States federal law requiring a warning of flashing lights even in television content.

And because the voluntary character of the audience exposure does not extend to the worker, the resident, or the person walking past an architectural installation, and because a person who has consented to attend a concert has not thereby been given any information about what the emission will be. Part IX.F asks the Department to require disclosure of emission characteristics. This is the class in which the absence of disclosure is most complete: a ticketholder cannot learn

the modulation frequency or depth of the fixtures at a venue, and neither can a person with diagnosed photosensitivity who has been advised by a clinician to avoid exactly those conditions.

L. LED Products That Also Emit Radiofrequency Energy [RFI Q13]

This class is defined by a property of the product rather than by where it is installed: it comprises light-emitting diode products that emit radiofrequency energy as well as optical radiation. Part II.B.5 establishes the consequence under the Act. Both emissions are electronic product radiation within § 360hh(1)(A), both arise from the operation of an electronic circuit within the same product, and a single product may therefore engage the performance standards of part 1030, which governs microwave and radiofrequency emitting products, and the optical provisions of part 1040.

The regulatory position is not symmetrical, and the asymmetry is the reason this subsection exists. The radiofrequency emission of such a product is subject to the rules of the Federal Communications Commission, which require authorization of unintentional radiators and limit what they may emit. Those limits exist to prevent interference with other radio services. The optical emission of the same product is subject to nothing. So a product that emits two kinds of electronic product radiation is constrained in one of them, for a reason unconnected with health, and unconstrained in the other.

Part II.H.8 sets out the Commission among the agencies with which this Department is directed to consult and maintain liaison, Part II.H.20 sets out the one documented instance of such consultation in the history of the program, which occurred in 2019 and concerned radiofrequency, and Part IX.E.4.b sets out a docket of that Commission that is open as this comment is filed. The Foundation draws attention to the sequence: the single occasion on which this Department consulted that Commission about electronic product radiation concerned the emission the Commission already regulates, and not the one nobody does.

1. Networked and wirelessly controlled luminaires

What the products are

Lamps, luminaires and lighting controls containing a radio. The class includes the consumer lamp controlled from a telephone, the commercial luminaire on a building management network, and the controller, sensor or gateway installed alongside them. The radio may use any of the short-range protocols in common use. The defining feature for this comment is that a lamp, which was formerly a passive device on a circuit, is now also a transmitter and in many cases a receiver that is energized whenever the fixture has power, whether or not it is emitting light.

Who is exposed, and under what conditions

The occupants of the building, continuously, at distances of a few meters, from devices mounted overhead. The exposure differs from most of the radiofrequency exposure a person receives in that the person did not choose the device, frequently does not know it is transmitting, and cannot switch it off without switching off the light. Part III.G.2 treats user control of indicator lights as a technique of minimization and the same reasoning reaches the radio: a person who wants light does not necessarily want a transmitter.

The federal position

Authorization under the Commission's rules establishes that the device will not cause harmful interference. It is not a health determination and is not presented as one by the body that issues it. No federal evaluation of the combined exposure from a product of this kind has been identified by the Foundation: that is, no evaluation that considers the optical emission and the radiofrequency emission of the same device together, which is the exposure the occupant of the room actually receives. Part II.B.5 establishes that the Act reaches both.

2. Smart-city and connected streetlight systems [RFI Q13.h]

What the products are

Street lighting in which each pole carries a networked control node. The node reports the condition of the luminaire, accepts dimming and scheduling commands, and in many deployments communicates over a cellular or mesh radio link. The same pole may carry additional municipal equipment attached to the lighting network, including cameras, environmental sensors and acoustic sensors. The lighting conversion is frequently the occasion for the network: the pole is already being visited and already has power.

Who is exposed, and under what conditions

Residents of the street, continuously and involuntarily, from a fixed installation in the public right of way outside their dwellings. The exposure cannot be avoided by leaving a building, which distinguishes it from the class at subsection 1, and it cannot be declined, because the installation belongs to the public entity rather than to the resident. Part VI.D treats the optical emission of roadway and area lighting and Part VI.P treats light trespass into dwellings.

The federal position, and the one that matters here

The radio link is authorized under the Commission's rules. The optical emission is subject to no federal limit, as Part VIII.D.1 establishes. And the federal involvement in the installation of these systems has been as a driver of it rather than as an evaluator: Part IV.G sets out the efficacy framework that drove the conversion to light-emitting diode roadway lighting, and Part IV.G.5 establishes that no biological or health evaluation accompanied it.

What this class adds to the comment

It adds the identity of the purchaser, and that is why the Foundation treats it separately rather than as an instance of subsection 1. The entity procuring a connected street lighting system is a public entity, and Part VIII establishes what else that entity owes. It holds the self-evaluation duty of 28 C.F.R. § 35.105, which Part VIII.C shows it cannot complete for the optical emission because no federal characterization exists. It is now procuring, on the same poles and in the same transaction, a second emitting system, with no federal criterion for the exposure from either. A city which asked what the combined installation outside a resident's bedroom window delivers to that resident would find no federal answer to either half of the question.

The Foundation makes no assertion about the health effects of the radio link, has not evaluated it, and relies on no study about it. Its position is confined to allocation: both emissions are electronic product radiation under § 360hh(1)(A), this Department holds the program duty for both under § 360ii, and the characterization requested at Part IX.C would have to reach the product as installed rather than the luminaire in isolation.

3. Autonomous and driver-assistance vehicle systems [RFI Q13.i]

What the products are

The sensing and signaling systems of vehicles with driver-assistance or automated driving functions. Three emissions are relevant and they are of different kinds. Optical signaling and illumination, which is the subject of Part VI.B. Radar, which is radiofrequency. And lidar, which emits pulsed infrared laser radiation from a device mounted on the vehicle and scanned across the scene in front of it.

Why lidar is the most important item in this subsection

Because it is the one emission in this entire Part for which this Department has already prescribed a performance standard. Part II.A.2 enumerates the standards at part 1040, and the first two are for laser products and for specific purpose laser products. A lidar unit is a laser product. Whatever

classification it carries, it falls within a regime this Department wrote, administers and enforces, and its emission is therefore subject to a federal limit expressed in radiometric terms.

Set that beside the headlamp mounted a few inches away from it. The headlamp emits visible light, at an intensity Part VI.B.1 and Part V.C establish to be the subject of the largest single group of accounts at Appendix A, and no federal performance standard limits what it may emit as a radiometric quantity. The same Department, on the same vehicle, limits the infrared laser and not the visible beam. The Foundation advances that as the clearest available demonstration that the obstacle is not authority, not capability, and not the difficulty of writing a radiometric limit for a vehicle-mounted source. The Department has done it. It has done it for the emission the driver of the oncoming car cannot see.

Who is exposed, and under what conditions

Other road users, pedestrians and cyclists, at close range, from a moving platform, at night as well as by day, involuntarily and without notice. The number of emitting devices in the field of view rises with the number of equipped vehicles, which is the characteristic Part III.D.8 treats and which Question 15 of the notice raises. Part V.J.2 establishes that measurement conditions determine the result, and the conditions here are motion, multiplicity and darkness.

The federal position

Divided, and the division is between this Department and another. The vehicle and its lamps are within Federal Motor Vehicle Safety Standard No. 108, administered by the National Highway Traffic Safety Administration. The radar is within the Commission's rules. The laser is within this Department's own part 1040. No single body evaluates what the composite installation delivers to a person standing in front of it, and Part IX.E.4.a sets out the proceeding now open at the Department of Transportation in which the question could be raised.

4. Conducted and radiated emissions from LED drivers

What the products are

The driver is the circuit that converts the supply to the current a diode requires. In almost every product in this Part it is a switching converter, operating at frequencies in the tens or hundreds of kilohertz, and it is the component that produces both the temporal modulation Part V.D treats and the electrical emissions this subsection concerns. Those emissions take two forms: energy conducted back onto the building wiring, and energy radiated from the product and from the wiring attached to it.

Who is exposed, and what is reported

Occupants of the premises, and users of equipment connected to the same wiring. Part VII.B.7 sets out the accounts at Appendix A describing radiofrequency interference attributed to light-emitting diode products. The Foundation reproduces those accounts without adopting them and asserts no mechanism for any health effect of conducted or radiated emissions; what it records is that the reports exist and that they describe a second emission from the same product.

The federal position

The Commission's limits for these emissions are interference limits. They are expressed as field strength at a stated measurement distance, or as voltage on the supply line, and their purpose is the protection of radio services rather than of people. The Foundation states that without complaint: the limits do what they were written to do. The consequence for this comment is that a product may comply with every applicable electrical emission limit while the question this Department is directed to ask under § 360ii(a)(2), which is whether the emission and the exposure to it are unnecessary and can be minimized, has not been asked about either of its emissions.

M. Products Intended for or Used by Children

Every other class in this Part is defined by what the product is. This one is defined by who holds it. The Foundation separates it for three reasons: the exposure geometry is different, because a child brings an object closer to the eye than an adult does and for longer; the receiving eye is different, because the young lens transmits more short-wavelength light than the adult lens; and the regulatory position is different, in a way that is specific enough to state in a single sentence and is set out at subsection 3.

1. Toys containing light-emitting diodes

The Center has classified this product. Product code RIO, led toys and entertainment products, is assigned to products that incorporate light-emitting diodes to be used in toys or entertainment products to control, illuminate or interact with the user, and the radiation type recorded against it is optical. Appendix F.1.14. The applicable performance standard recorded against it is that no standard is applicable and the general radiological health requirements of parts 1000 to 1005 apply. The product is therefore an electronic product emitting electronic product radiation, so classified by this Department, with no emission limit of any kind.

What such products emit is not a matter of inference. Part V.C.2.k sets out a market surveillance campaign in which fifty toys containing one hundred and three diodes were bought from retailers and tested by accredited laboratories against the eye safety limits of the European standard that governs them, and thirty percent of the toys contained at least one diode that failed. Appendix C.59. It also sets out the opinion of the national health agency that commissioned that campaign, which concluded that the limits the toys were tested against are themselves derived from an arithmetical error and asked for the standard to be suspended. Appendix D.1.18.

Neither finding is about the United States, and the Foundation does not present either as describing this market. They are offered for what they are: the only systematic measurements of optical emission from toys in commerce that the Foundation has been able to identify anywhere, produced by a national government that asked the question. No comparable measurement of the American market has been identified, and the reason is given at subsection 3.

2. Products given to children that are not toys

A standard addressed to a product category leaves uncovered the same emission from a product outside the category, which is the proposition at Part II.C. The national health agency named four such products in terms: night lights, torches, illuminated clothing and decorative lamps. Appendix D.1.18. Its expert committee recommended that these undergo the same ocular safety assessment as toys, on the ground that a child’s eye does not distinguish between an emission from an object sold as a toy and the same emission from an object that is not.

In the classification maintained by this Department those products are distributed across at least three codes and possibly four. A night light or a decorative lamp falls within RIQ, low emission leds as indicators or decorations, whose definition expressly includes decorative purposes and which is examined at Part VI.G and Appendix F.1.20. A torch falls within RHH, which names flashlights. Illuminated clothing has no evident code. None of the codes carries a performance standard, so the distribution has no consequence for what any of these products may emit; it is recorded because the Department will need it if a standard is ever prescribed.

The Foundation adds one product the national agency did not name, because it is the one its correspondents raise most often and because it is squarely within this class. A child sleeps in a room. Part VI.G and Part IX.J address the indicator lamp that remains illuminated in that room through the night, and the Foundation does not repeat the argument here beyond noting that the occupant of the room is frequently a person who did not choose the product, cannot reach the switch, and is at the age at which the lens transmits the most.

3. The federal standard that governs toys in the United States limits sound and does not limit light

The Foundation states this subsection carefully, because it is the strongest single proposition in this Part and it rests on two federal instruments rather than on any study.

Toys sold in the United States are governed by a mandatory federal safety standard. Section 106 of the Consumer Product Safety Improvement Act, 15 U.S.C. § 2056b, made the voluntary toy safety standard of ASTM International a consumer product safety standard enforceable as such, and the Consumer Product Safety Commission has incorporated the current edition by reference at 16 C.F.R. § 1250.2(a). The edition presently incorporated is ASTM F963-23, effective April 20, 2024.

That standard limits what a toy may emit. Section 4.5 governs sound-producing toys and sets numerical limits in decibels, with a test method at section 8.20 and a stated rationale at Annex A14.4. The Commission describes the purpose of the section as reducing the risk of hearing loss. The limits are specified at a stated measurement distance, and the Commission's rulemaking records that the distance was changed from 25 centimeters to 63.5 centimeters when the standard was revised, which is the same structural feature this comment examines at Part V.C.2.k in another toy standard on another continent.

The Foundation has not identified any provision of that standard addressed to optical emission. There is no limit on luminance, on luminous or radiant intensity, on blue-light-weighted radiance, on modulation, or on any other optical quantity, and no photobiological assessment requirement of any kind.

So the position in the United States is this. A toy that makes a sound loud enough to damage a child's hearing may not lawfully be sold, and the limit is written down, measured by a prescribed method at a prescribed distance, and enforced by a federal agency. A toy that emits light of any intensity whatever may lawfully be sold. The agency that has classified that toy as a radiation-emitting electronic product, and given it a product code, is this Department, and it has prescribed nothing.

The Foundation does not say that the two emissions are equivalent or that the two agencies have the same duty. It says that the asymmetry is not explained by any difference in statutory authority. The Commission acted on sound under a general consumer product safety authority. This Department holds a specific authority over electronic product radiation, has exercised it to classify the product, and has the standard-setting power of § 360kk and the recommendation power of § 360ii(b)(1). Part IX.E.4 asks what consultation has occurred between the two.

4. What the Foundation asks for this class

Nothing that requires a finding this record cannot support. That the Department state on the record whether the product classified under RIO is within the scope of its authority, which Part IX.A asks generally. That it consult the Consumer Product Safety Commission under § 360ii(a)(3), which Part IX.E.4 sets out. That the research at Part IX.C include this class and address the exposure geometry and the receiving eye specific to it. And that any classification system developed under Part IX.G treat the age of the person exposed as a parameter rather than as a qualification added afterward.

N. Lighting on Bicycles, Scooters and Personal Mobility Devices

This class exists because of a gap in the federal scheme that is easy to state and, so far as the Foundation can establish, complete. A bicycle is not a motor vehicle, so the motor vehicle lighting standard does not reach its lamps. Part VI.B. The one federal requirement that does govern bicycles governs reflectors and requires no lamp at all. And the lamps now fitted to these conveyances are among the most intense small-source emitters a person encounters at eye level.

1. What the products are

Forward lamps and rear lamps fitted to or carried on bicycles, electric bicycles, scooters, hoverboards, skateboards and similar conveyances; side, wheel and spoke lighting; deck and frame illumination; and helmet-mounted lamps. Appendix F.2.12 sets the class out as a proposed product code and this subsection describes the exposure behind it.

Three characteristics distinguish these lamps from the vehicle lamps at Part VI.B. They are mounted low, at roughly the eye height of a seated driver and of a walking adult, rather than above the roadway. They are commonly operated in a flash mode, which Part V.D treats and which on a bicycle is chosen by the rider rather than specified by anyone. And they are sold on luminous flux as a marketing figure, in lumens, with no statement of beam angle, luminance or spectral distribution, so the quantity a purchaser is given is the one quantity that does not describe what the lamp does to an eye. Part V.J.

2. Who is exposed, and under what conditions

Oncoming drivers, pedestrians and other riders, at close range, at night, on shared paths and streets. The exposure differs from the roadway classes in that the source moves toward the observer at closing speed rather than passing at a fixed height, and in that there is no aiming requirement, so the lamp points wherever it was clamped. Part VII records ten reports of harm attributed to a bicycle, electric bicycle or scooter lamp.

3. The federal position, which is that there is none

The Foundation sets out each instrument that might govern this class and what it does.

Federal Motor Vehicle Safety Standard No. 108 governs lamps on motor vehicles. A bicycle is not a motor vehicle and the standard does not reach it. Part VI.B.1 and Part II.H.5.

The Consumer Product Safety Commission's requirements for bicycles, 16 C.F.R. part 1512, do reach bicycles, and what they require is passive. Section 1512.16 opens by directing that "Bicycles shall be equipped with reflective devices to permit recognition and identification under illumination from motor vehicle headlamps", and then prescribes an essentially colorless front-facing reflector, a red rear-facing reflector, pedal reflectors front and rear, and either retroreflective tire sidewalls or spoke-mounted reflectors. The section does not require a bicycle to carry a lamp. It specifies no luminous intensity, no beam angle and no photometric limit of any kind for a lamp, because it is not about lamps.

The Foundation asks the Department to notice the premise of that regulation, because the premise is what has been overtaken. The requirement is written so that a bicycle can be recognized under illumination from a motor vehicle's headlamps. It treats the bicycle as a passive object which is seen because something else lights it. Light-emitting diode lamps inverted that: the bicycle is now an active emitter, often operated in flash mode, aimed horizontally, and bright enough that the rider is seen from a distance. Nothing in the federal scheme followed the inversion. The reflector rule still describes a passive object, the motor vehicle standard still excludes the conveyance, and no instrument addresses what the lamp emits.

Within this Department's own scheme the position is the one this Part reports for every other class. Section 1040.10 governs laser products and these are not laser products, which Part IX.A.5 describes from this Department's own page. No standard under § 360kk reaches them. Appendix F records that no existing product code reaches them either, which is why F.2.12 proposes one.

4. What the Foundation asks as to this class

That the class be given a product code, which Appendix F.2.12 sets out in the fields the Center's own entries use. That the disclosure sought at Part IX.F reach it, so that a lamp sold on a lumen figure carries the beam angle and the luminous intensity as well. That the research at Part IX.C include the exposure geometry specific to this class, which is a small high-radiance source at eye

height closing on the observer. And that any standard prescribed under Part IX.I address the flash mode, which on these products is selected by the user and limited by nobody.

O. Aircraft, Drone, and Obstruction Lighting

Part II.H.7 treats the Federal Aviation Administration as an agency and sets out what its instruments contain: the obstruction lighting specification with its candela values and its mandated reduction at night, the lighting rule for small unmanned aircraft with its minimum and no maximum, and the certificates authorizing performances flown with thousands of aircraft at once. This subsection does not repeat that. It describes the product class and the exposure, which that Part does not.

1. What the products are

Three families, which share a characteristic and little else. Obstruction lighting on towers, masts, wind turbines, tall buildings and other structures, in steady red, flashing red, and medium- and high-intensity white. Lighting carried on aircraft, including anti-collision strobes, position lights and landing lights. And lighting carried on small unmanned aircraft, which since 2021 may be operated at night and must then carry anti-collision lighting visible for at least three statute miles. Part II.H.7.

What they share is that each is designed to be conspicuous at a distance of miles, which is a specification for a small source of very high intensity, and that each is operated above the observer at an angle from which no shielding is possible. What distinguishes them from every other class in this Part is that the exposure is incidental to the purpose: nobody installs an obstruction light in order to light anything, and the people who see it are not its intended audience.

2. Who is exposed, and under what conditions

Residents within sight of a lighted structure, which for a high-intensity white obstruction light at its daytime value is a considerable distance; people beneath an approach or departure path; and, for the unmanned aircraft, anybody outdoors where one is flown, including those outside the audience at a performance. The exposure is nocturnal, it repeats at a fixed rate for the whole of the dark period, and the observer has no control over it and frequently no idea whom to ask. Part VII records thirty-five reports attributed to security or neighboring-property lighting and sixty to streetlights; the Foundation has not separated out obstruction lighting and does not assert a count for this class.

One feature of the obstruction specification bears directly on who is exposed, and it is to the specification's credit. The intensity is required to step down at night, automatically and by a large factor, and Part II.H.7 gives the figures. The Foundation records that because it is the only federal lighting instrument the Foundation has found which mandates a nighttime reduction as a condition of conformity, and because it answers the objection that the capability sought at Part IX.J is impracticable. It also records that the reduction exists so that the lamp can be seen against a dark sky rather than for the benefit of anyone beneath it.

3. The federal position

For obstruction lighting there is a federal specification, it is numerical, and it is expressed in candelas, flash rates and flash durations. It is not a health instrument and does not address the exposure of persons on the ground, and Part II.H.7 says so. For small unmanned aircraft there is a federal rule which sets a minimum conspicuity and no maximum, and in which the words luminance, brightness, candela and glare do not appear. For lighting carried on aircraft the Foundation has not established the governing provisions and does not state them.

Within this Department's scheme the position is the usual one. No standard under § 360kk reaches any of the three families, and Appendix F records no product code that reaches them. That

absence is worth stating because it is not duplicated elsewhere: for the other classes in this Part the Foundation can at least point to a proposed code. For this one it cannot.

4. What the Foundation asks as to this class

That the obstruction lighting specification be obtained and examined by this Department, for the reason given at Part II.H.7: it is the nearest thing in federal practice to the ambient-sensing and default-low capability Part IX.J asks the Department to recommend, and a Department recommending such a capability should know what the existing federal instrument already does. That the lighting rule for small unmanned aircraft be consulted on under paragraphs (a)(3) and (a)(6), the aviation agency having acknowledged in its own circular that a strobe on one of these aircraft can impair accurate observation by a human eye while limiting the remedy to the pilot. And that any classification system developed under Part IX.G treat elevation above the observer, and motion of the source, as parameters.

P. Residential and Multifamily Exterior Lighting, and Light Trespass

Every other class in this Part is chosen by somebody with a relationship to the exposed person: a manufacturer selling to a purchaser, an employer lighting a workplace, a public authority lighting a street. This class is chosen by a neighbor. The emitter is privately owned, it is installed on private property for the owner's own purposes, it is directed at property the owner does not own, and there is no federal regulator, no state regulator in most places, and frequently no local ordinance either. Part VI.I treats deterrent and surveillance lighting as a commercial product class. This subsection treats the same physics in the setting where no institution stands between the emitter and the exposed person at all.

1. What the products are

Wall-mounted and eave-mounted floodlights on houses, condominiums and apartment buildings; motion-activated security lamps; driveway, path and landscape lighting; pole-mounted yard lights; garage and carport lighting; and the exterior lighting of multifamily common areas, parking areas and walkways, which is selected by a landlord or an association and directed at dwellings including those of the tenants themselves. Appendix F.2.5 proposes a code reaching roadway, area and exterior luminaires, and Appendix F.2.13 one reaching deterrent, surveillance and security lighting systems.

2. Who is exposed, and under what conditions

A person in their own dwelling, at night, in a room they cannot darken, for as long as the neighboring installation operates. The exposure reaches the eye of someone lying in bed, which is the condition Part V.G treats for circadian effect and Part V.C for the dark-adapted eye, and it reaches them through a window, which means the mitigations Part VII records — window coverings in eight reports, shielding in fifty-four — are mitigations the exposed person pays for and installs in order to exclude a product somebody else bought.

Part VII records thirty-five reports attributed to security or neighboring-property lighting. The Foundation draws attention to one feature of that group rather than to its size. In these reports the exposed person commonly knows exactly who is responsible, has asked, and has been refused, and in at least one instance the request produced retaliation rather than relief. That is a different situation from every other class in this comment, where the exposed person cannot find anyone to ask, and it bears on the remedy: a person in this situation does not need to be told who installed the light.

3. The federal position, and why its absence has a different character here

There is no federal instrument. There is no performance standard under § 360kk, no product code reaching the class as such, and no federal requirement governing the luminance, the spectral

distribution, the aiming or the shielding of a privately owned exterior lamp. That much this subsection shares with the rest of this Part.

What differs is the alternative. For a vehicle headlamp there is a federal standard that could carry a limit. For roadway lighting there are consensus recommendations adopted by public authorities, which Part VI.D examines. For a workplace there is an employer and an occupational safety program. Here there is private nuisance law, which the Foundation describes accurately rather than dismissively: it is retrospective, it requires the injured person to bring an action against a neighbor, it turns on reasonableness rather than on any measured quantity, and it produces no standard that anybody can design to. A person seeking relief must establish, case by case, that a thing is unreasonable when no instrument anywhere states what reasonable is. Part V.J sets out that the quantity which would settle it is not recorded by anyone.

The Foundation does not ask this Department to regulate what a householder may install on their own wall, and nothing in this subsection asks for that. Part II.H.3 records the Foundation's position that it does not ask this Department to assume the authority of States and municipalities over lighting design. What it asks is what it asks everywhere in this comment: that the emission characteristics of the product be established and disclosed, so that the person who buys the floodlight knows what it emits, the person exposed to it can say what reaches them, and a local authority minded to legislate has a quantity to legislate in. The absence of a measured quantity is what makes this class irresoluble, and the measurement is federal work.

4. What the Foundation asks as to this class

That the disclosure sought at Part IX.F reach consumer exterior luminaires, in the quantities Part V.J identifies rather than in lumens alone. That the research at Part IX.C include exposure through a window at night, which is a geometry no existing assessment framework addresses and which Part V.C.2 sets out. That the classification system at Part IX.G treat trespass geometry — the light that leaves the property on which the lamp is installed — as a parameter of the class, since it is the parameter that distinguishes this class from every other. And that the recommendations the Department may make under § 360ii(b)(1), which Part IX.J sets out and which require no standard and bind nobody, address this class expressly, because it is the class in which a recommendation would do the most work: a stated federal view on shielding and on aiming would be available to every local authority in the country at once.

Q. Rail and Marine Lighting

Two transport modes, each with its own federal regulator, each converting to light-emitting diode sources, and each governed by an instrument that specifies a minimum intensity and no maximum. The Foundation treats them together because the pattern is the same and because the two sets of figures, set beside each other, show how little the pattern has to do with how much light is actually needed.

1. Locomotive lighting: the highest federal minimum the Foundation has found

Locomotive lighting is governed by 49 C.F.R. § 229.125, Headlights and auxiliary lights. Four of its provisions bear on this comment.

The headlight requirement is a floor, and it is a high one. Paragraph (a) directs that each lead locomotive used in road service have a headlight producing a peak intensity of at least 200,000 candela, arranged to illuminate a person at least 800 feet ahead of it. Paragraph (b) sets 60,000 candela for yard service, with illumination of a person at least 300 feet ahead.

The auxiliary lights are the same figure again, and there are two of them. Paragraph (d) requires that a lead locomotive operated above twenty miles an hour over a public highway-rail crossing carry two white auxiliary lights, placed to form a triangle with the headlight, and paragraph (d)(2) directs that each of them produce a peak intensity of at least 200,000 candela, or alternatively at least 3,000 candela at an angle of 7.5 degrees and at least 400 candela at 20 degrees from the

centerline when aimed parallel to the tracks. Paragraph (d)(3) requires that they be focused horizontally within 15 degrees of the longitudinal centerline. So the instrument contemplates three sources, each with a floor of 200,000 candela, aimed within 15 degrees of the direction of travel, at a grade crossing where a motorist is stopped facing them.

They may flash. Paragraph (e) permits the auxiliary lights to burn steadily or to flash on approach to a crossing, and if they flash they must flash alternately "at a rate of at least 40 flashes per minute and at most 180 flashes per minute". Part V.D sets out the response to temporal modulation in that range. The Foundation notes that this is one of the few federal lighting provisions that contains an upper bound of any kind, and subsection 3 sets out what the bound was adopted for.

And there is a dimming provision, which does not reach the lights that matter here. Paragraph (c) provides, in its entirety: "Headlights shall be provided with a device to dim the light." That applies to the headlight. It does not apply to the auxiliary lights, and subsection 3 sets out that the omission was considered and made deliberately.

No provision of the section sets a maximum intensity. Every intensity figure in it is a floor.

2. Marine navigation lights, and the same structure at a millionth of the output

The inland navigation rules are at 33 C.F.R. part 83 and their technical annex at part 84. The intensity provision is § 84.14, which sets a formula rather than a table of products: the minimum luminous intensity is calculated from the required range of visibility, a threshold factor of 2 times 10 to the minus seventh lux, and an atmospheric transmissivity of 0.8 corresponding to a meteorological visibility of about 13 nautical miles. The section prints a selection of figures derived from it.

Those figures are the reason this subsection puts the two modes side by side. A light required to be visible at one nautical mile needs a minimum luminous intensity of 0.9 candela. At two miles, 4.3 candela. At three miles, 12. At four, 27. At five, 52. At six nautical miles — the range required of a masthead light on a vessel of fifty meters or more — 94 candela. Rule 22, at § 83.22 inland, sets the ranges by vessel length: six miles for the masthead light of a large vessel, three for its sidelights and sternlight, and less for smaller craft.

The Foundation asks the Department to hold those two sets of figures together, because the comparison is the argument. A federal instrument requires a light to be seen across six nautical miles of open water, at night, by a mariner whose life may depend on seeing it, and sets the figure at 94 candela. Another federal instrument requires three lights, each of at least 200,000 candela, aimed along a railway at a motorist stopped a few tens of feet away at a crossing. The ratio is more than two thousand to one on a single source and more than six thousand on the three together. Neither figure is wrong for its purpose and the Foundation does not suggest the marine value would serve on a locomotive. What the comparison establishes is that conspicuity does not require intensity in the quantities now in use, that federal practice already contains an instrument which achieves a longer range with a vanishingly smaller output by attending to atmospheric transmission and to threshold rather than to brightness, and that nobody has ever been asked to reconcile the two. Part V.C.3 sets out why the quantity that injures an eye is not the quantity that makes a lamp visible.

On a maximum, the marine instruments are the one place in this comment where the Foundation has found a federal lighting rule that mentions one, and it states precisely what it found because the temptation to overstate it is considerable. The international regulations, in the note to section 8 of Annex I, provide:

> Note: The maximum luminous intensity of navigation lights should be limited to avoid undue glare. This shall not be achieved by a variable control of the luminous intensity.

Four qualifications govern that, and the Foundation states all four. It says should and not shall. It is a note appended to a table rather than an operative paragraph. It states no number, so there is no ceiling anywhere to comply with. And it does not appear in the United States inland annex at all: § 84.14 carries the formula and the table and no counterpart to the note. The accurate statement is therefore that an international instrument contains a non-numeric and non-mandatory recommendation that maximum intensity be limited to avoid undue glare, and that the American domestic annex omits even that. The purpose stated is navigational in any event: undue glare affecting a mariner's ability to see, not the protection of anybody's eyes as a health matter.

Two further marine provisions are worth recording because they are the nearest thing in either mode to a restraint on an emission. Rule 20(b), at § 83.20(b) inland and in identical terms internationally, provides that from sunset to sunrise "no other lights shall be exhibited, except such lights as cannot be mistaken for the lights specified in these Rules or do not impair their visibility or distinctive character, or interfere with the keeping of a proper look-out." And international Rule 36, on signals to attract attention, provides that "the use of high intensity intermittent or revolving lights, such as strobe lights, shall be avoided". That sentence does not appear in the inland rule at § 83.36. Both provisions protect the navigational function rather than the eye, both bind only vessels, and the first runs only between sunset and sunrise. The Foundation offers them for what they are: evidence that a regulator which has to care whether people can see has found it necessary to restrain other lights, and has done so without any photometric quantity to restrain them by.

3. What the railroad regulator considered, declined, and later found

This subsection is the reason the class is in this comment, and the Foundation sets it out in sequence because the sequence is the point.

When the auxiliary light requirement was adopted in 1996, the agency considered whether to require a dimmer on those lights and declined. The rulemaking records that the one argument made for a dimmer was that the device might prevent blinding motorists, and that the agency could identify no compelling safety need for a dimmer on auxiliary lights. It acknowledged in the same document that there appears to be a risk that the auxiliary lights might affect the night vision of motorists on parallel roadways. And the statutory direction under which it was acting required it to consider the effect of an enhanced visibility measure on the vision, health and safety of train crew members.

The Foundation asks the Department to read those three facts together and states what it draws from them, which is narrower than it may appear and does not depend on criticizing that agency. The agency identified a risk to the vision of people outside the railroad. It declined a mitigation for them. And the mandate it was working under named one population whose vision it was to consider, and that population was its own crews. There is no criticism in that. An agency given a mandate naming train crew members does not acquire authority over the eyes of motorists by noticing that they are affected. What it does have, when it notices, is a reason to tell somebody who does have that authority, and paragraph 360ii(a)(6) is the provision under which that conversation would happen. Part II.H. The Foundation has identified no record of it.

The same reading applies to the flash rate. The section caps flashing at 180 flashes per minute, which is three hertz, and the rulemaking ties that cap to avoiding a flicker vertigo effect on train crew members. So the one upper bound in the instrument exists to protect the people inside the cab. Part V.D sets out what is known about the response of people outside it to modulation in that range, and Part V.E the photosensitive response. The bound is in the right place for the wrong population, which is a more precise way of putting what this comment says generally.

Then the technology changed, and that agency looked at it. In October 2020 its Office of Research, Development and Technology published Compliance Testing for Locomotive LED Headlights and Auxiliary Lights, Phase II, which evaluated discomfort glare from light-emitting diode and halogen lamps using the De Boer scale. Its finding, in its own words, was that for glare ratings

made in dim mode there were statistically significant differences between the two lamp types, "with LED lamps producing worse glare ratings than halogen lamps", and that while the diode lamps gave better contrast and more illuminance in dim mode they "produced significantly worse levels of discomfort glare". Its executive summary states the regulatory consequence:

> the safety requirements stipulated in §229.125 may not adequately accommodate the introduction of LED lamps

That is a federal agency, examining its own performance requirement against the diode source, finding that the requirement may not accommodate the technology, and saying so in a published report in 2020. Part II.F sets out that this Department has conducted no such examination for any product class. Part V.L records the research gaps this comment identifies. The Foundation does not suggest that the railroad agency should have gone further than it did; it studied the question within its own subject and reported the answer. It observes that the answer was published, that it concerns the glare produced by a diode lamp against a performance requirement expressed in candela, and that it is precisely the kind of information paragraph (a)(3) directs this Department to receive from agencies with related interests.

The Foundation records the limits of that report rather than leaving them to be found. It measured discomfort glare and nothing else: not disability glare, not photobiological hazard, and not any effect on a motorist at a crossing, a pedestrian or a trespasser, the observers having rated the lamps from outside the cab. It recommended no maximum intensity. A companion report of April 2021 tested six lamp models and concluded that there were no detrimental effects to the use of diode technology and no detectable degradation in visibility. The Foundation does not present the Phase II finding as a conclusion about health, and it is not one. It presents it as a federal measurement, on a federal performance requirement, showing the diode source performing worse than what it replaced on the one axis that was measured.

4. Who is exposed, and what the Foundation asks

For rail: motorists and pedestrians at grade crossings, where the geometry is three sources of at least 200,000 candela each, aimed within 15 degrees of the direction of travel, possibly flashing, at a person stopped and facing them; people living or working alongside track, including along the parallel roadways the 1996 rulemaking mentions; and railroad employees, who are the one population the mandate names. For marine: other mariners, and people ashore in harbors and along waterways, where the required outputs are small but deck lighting, spotlights and non-required lighting are not regulated photometrically at all.

Four requests, none of which asks this Department to regulate a railroad or a vessel. That the Department obtain the Phase II report and state whether it agrees with its finding, which is a question about a measurement rather than about policy. That it consult the railroad agency under paragraphs (a)(3) and (a)(6) concerning that report and concerning the adequacy of a performance requirement expressed in minimum candela for a diode source, the agency having itself raised the question. That the disclosure sought at Part IX.F reach these classes. And that the comparison at subsection 2 be addressed in whatever the Department develops under Part IX.G: two federal instruments, one requiring 94 candela to be seen at six nautical miles and the other 200,000 to be seen at 800 feet, cannot both be calibrated to what seeing requires, and the discrepancy is a fact about federal lighting practice that a classification system ought to be able to explain.

R. Traffic Signals and Roadway Control Signals

This class is the one in which the loss of a physical property is easiest to describe and has been least examined. The Foundation sets it out in that order: what governs these products, what the governing instrument specifies, what it does not, and the one federal report in which the same agency has already conceded the same pattern for a different property.

1. What the products are, and who is exposed

Vehicle traffic control signal heads in red, yellow and green, circular and arrow; pedestrian signal indications and countdown modules; and the roadway control signals of the same family. Appendix F.2.9 proposes a product code reaching light-emitting diode traffic signal heads and roadway control signals, and this subsection describes the exposure behind it.

The exposed population is everybody who uses a road, and the condition of exposure is specific: the observer is stationary or nearly so, facing the signal directly, at a distance fixed by the stop line, for the duration of the interval, repeatedly, every day. No other class in this Part has that geometry. Part VII records reports attributed to traffic signals, and Part VI.C treats the flashing warning devices which are a different family governed by a different chapter of the same manual.

One fact about this class has no parallel in the comment and belongs at the start. These products were almost universally incandescent, and are now almost universally light-emitting diode, and the conversion was driven by federal energy policy rather than by anything about signaling. Part IV.G describes the same mechanism for general illumination. So the exposure changed, across every intersection in the country, for reasons that had nothing to do with what a driver sees.

2. What governs these products, and the difficulty of reading it

The Manual on Uniform Traffic Control Devices governs. The eleventh edition was adopted by final rule at 88 Fed. Reg. 87,672 (Dec. 19, 2023), effective January 18, 2024, and Revision 1, dated December 2025, was adopted by final rule published March 5, 2026; the manual is incorporated into the federal regulations at 23 C.F.R. § 655.601.

What the manual does about the optical characteristics of a signal module is to point elsewhere. Section 4E.01, paragraph 10, is a Standard statement and directs that for light-emitting diode traffic signal modules the requirements of two publications of the Institute of Transportation Engineers be met: the Vehicle Traffic Control Signal Heads: Light Emitting Diode (LED) Circular Signal Supplement of 2005, and the corresponding Vehicle Arrow Traffic Signal Supplement of 2008, in each case as to “the aspects of the signal head design that affect the display of the signal indications”. Paragraph 11 is Guidance and provides that the intensity and distribution of light from each module should comply with those publications.

Two consequences follow and the Foundation states both, because the first cuts against it.

The first is that the status of those publications is not straightforward. Section 1A.05, paragraph 1, incorporates by specific reference only two documents, and the engineering publications are not among them. Paragraph 4 of the same section, which is Support rather than Standard, provides that “Other publications are referenced in this Manual as useful resources, but they are not regulatory in nature and are not independently legally enforceable.” So the engineering specification is made operative by a Standard statement in Chapter 4E and described as not independently enforceable in Chapter 1A. The Foundation does not resolve that and does not need to. It records it because any argument built on paragraph 10 has to face it, and because a reader who is told the specification governs is entitled to know that the manual says something else about referenced documents elsewhere.

The second is that the specification cannot be read. The engineering institute sells these documents and they are available only through purchase. So the numerical requirements governing the optical output of every traffic signal in the United States — the maintained minimum luminous intensity, the chromaticity coordinates, the electrical requirements — are in documents a member of the public cannot read, referenced by a federal manual that can be. The Foundation states that as a fact about accessibility of the governing quantities rather than as a complaint about the institute, which is entitled to sell its publications. It bears on Part IX.F, which asks that emission characteristics be disclosed, because here the characteristics are specified and the specification is itself behind a paywall.

3. What the instruments specify in the time domain, which is a schedule and not a shape

The Foundation searched the governing manual for every temporal term bearing on the switching of a module: rise time, decay, turn-on, turn-off, flicker, modulation, waveform, duty cycle and millisecond. None of them appears in the part of the manual that governs these products. The word frequency appears, and in every instance it means the frequency of crashes, of rail traffic, or of how often an interval is displayed. There is no temporal axis in the manual at all.

What the manual does specify in time, it specifies for pedestrian indications, and it is a schedule. The flashing upraised hand "shall be flashed continuously at a rate of not less than 50 or more than 60 times per minute", and "The displayed period of each flash shall be a minimum of one-half and a maximum of two-thirds of the total flash cycle." The Foundation draws attention to that second sentence because it is the only duty cycle requirement it has found in any instrument governing any product class in this Part. It constrains the ratio of on time to cycle time, at about one hertz. It says nothing whatever about the shape of either edge.

That distinction is the whole of this subsection and the Foundation puts it in one line. Temporal scheduling is specified. Temporal shape is not.

One temporal requirement does exist for the edge, and the Foundation records it because it runs the wrong way for the argument and must be stated. State specifications for these modules impose an upper bound on switching time: one official state specification requires that turn-on and turn-off time be less than 75 milliseconds, and the same figure recurs on manufacturers' published data for signal modules. The Foundation has not been able to establish whether the figure originates in the engineering specification or was added by the State, because the engineering specification cannot be read. What matters is its direction. A ceiling on turn-on and turn-off time forbids a module from switching slowly. It is not a smoothing requirement; it is the opposite of one. So the position is not that nobody specified the edge. It is that where the edge was specified at all, it was specified as a maximum permitted duration, which excludes the gradual transition rather than requiring it.

On modulation the Foundation found one provision in any instrument it read, and it is qualitative. A state specification requires that a module operate across a stated range of line voltage and that "The circuitry shall prevent flickering over this voltage range." There is no modulation frequency, no modulation depth, no percentage, no flicker index and no measurement method. Part V.D sets out what those quantities are and why they decide the question. The nearest adjacent requirements in the specifications the Foundation read are stability clauses providing that a variation in line voltage shall not cause the light intensity to vary by more than a stated percentage, which are steady-state requirements and not temporal ones.

4. The property that was lost, and the federal report that concedes the pattern for a different one

An incandescent signal lamp has a filament with mass. Current heats it and it takes time to reach full output; when current is removed it cools and the output falls away over a further interval. The light therefore rose and decayed over some tens or hundreds of milliseconds, and nobody specified that because nobody had to: it was a property of the physics, supplied free with the lamp. A diode is a semiconductor and has no such mass. It switches at the speed of its drive circuit, which is to say effectively instantaneously. Part VI.D records the same observation for the roadway class, where the sources that were replaced "took minutes to reach output" and diode sources give instantaneous switching.

The Foundation does not assert a health consequence of that change and has no measurement establishing one. What it asserts is that a property of the exposure was removed from every intersection in the country, by a conversion driven by energy policy, without anyone examining what the property had been doing.

That assertion does not rest on the Foundation's reasoning alone, because the roadway agency has already conceded the identical pattern for a different property of the same lamp. In January 2014 the Federal Highway Administration published a report on light-emitting diode signal module specifications and snow conditions, which records that diode modules do not produce heat at the lens or the face of the signal display, that incandescent lenses typically provided sufficient heat for snow and ice to melt, and that the current module specifications do not address preventing snow and ice buildup. The report arose from a stakeholder workshop of December 2010 attended by the state highway officials' association, the electrical manufacturers' association, the signal association, the public works association, that agency, the engineering institute and the Department of Energy.

The Foundation asks the Department to read that report as a structural precedent rather than as a point about snow. Heat was a property that incandescent lamps supplied incidentally. Nobody specified it, because with a filament nobody had to. The conversion removed it. The specifications still do not address it, and a federal agency has said so in print. Thermal inertia in the time domain is the same kind of property, removed by the same conversion, and unaddressed by the same specifications. The agency has conceded the pattern once. The Foundation asks this Department to examine whether it holds twice.

5. What has actually been measured, and the limits of it

One government-sponsored comparison exists and the Foundation states both what it found and what it is. In December 2003 the Traffic Operations Laboratory of the University of Illinois at Urbana-Champaign published, for the Illinois Department of Transportation, a comparison between the turn on and turn off characteristics of incandescent and light-emitting diode traffic signal modules. Its stated objective was "to compare the turn on and turn off characteristics of incandescent and LED modules".

Its conclusions, in its own words: "For all colors, the LED lenses had shorter fade in times when compared with the incandescent lens"; "For solid yellow and red, the incandescent lens had the longest fade out time"; and, against the Foundation's expectation, "For solid green, the LED Dialight lens had the longest fade out time". The study also found no hazardous combination, reporting that none of the combinations tested could result in multiple signals glowing or in no signal glowing.

The Foundation states the limitation of that study prominently, because it governs how much the study can carry. The measurement was made by videotaping the signal heads and examining the recording frame by frame at thirty frames a second, so that one frame is about three-hundredths of a second. It is therefore an observational study with a quantization floor of roughly thirty-three milliseconds, and fade out is an observer's judgment of when a lens stops appearing lit on a recording rather than a measured decay of luminance. The report states that it does not constitute a standard, a specification or a regulation. The Foundation gives no figures from its tables in this comment, deliberately.

The Foundation has found no photometric measurement — by photodiode, photometer or oscilloscope — of the rise and decay of an incandescent traffic signal lamp against a diode module, in any peer-reviewed, governmental or standards-body source. For a change made at every intersection in the country, that is the whole of the measured record: one video study, twenty-three years old, at thirty frames a second.

One further document records that the question was identified and set aside. A 1999 report of a university lighting research center, examining luminous intensity for traffic signals, equalized the rise times of the two sources deliberately by gating both through the same shutter, and then observed that "The faster rise time of the LED signal may have an effect on reaction time and missed signals", flagging it for future study. The Foundation has identified no such study in the twenty-seven years since.

And one federal safety evaluation of the conversion exists which does not reach the question at all. In August 2013 the Federal Highway Administration published a safety evaluation of converting traffic signals from incandescent to light-emitting diodes, an empirical Bayes before-and-after study of 282 treated intersections. It reports crash modification factors and does not discuss rise time, decay time, thermal lag, temporal switching characteristics, flicker, or driver perception of onset or offset. Its only perceptual concern is stated in its background as issues related to visual discomfort caused by glare at night. The Foundation records that because it is the federal study of this conversion, and because what it examined was crashes rather than what the driver sees.

6. What the Foundation asks as to this class

Five things. That the class be given a product code, which Appendix F.2.9 sets out. That the Department obtain the engineering specification and state, on this record, what it requires as to intensity, chromaticity, modulation and switching, since the specification governs the optical output of every traffic signal in the country and the public cannot read it. That the Department measure the rise and decay of an incandescent signal lamp and of a diode module photometrically, which is a bounded and inexpensive experiment and is the measurement paragraph 360ii(a)(4) directs and Part II.F establishes has not been made for any product class. That the Department consult the roadway agency under paragraphs (a)(3) and (a)(6) concerning the 2014 report on heat, for the structural reason given at subsection 4. And that the disclosure sought at Part IX.F reach the temporal characteristics of a module, which Part I.H already lists among the characteristics to be disclosed and which nothing in this comment has until now explained the significance of.

S. Accent and Trim Lighting on Unattended Self-Service Equipment

This class is treated here for the first time, and the Foundation notes at the outset that doing so corrects a defect in this comment rather than only adding to it. Appendix F.2.7 already proposes a radiation-emitting product code for these products and names them, and until now no subsection of this Part described the class the proposal was written for.

1. What the products are, and the code already proposed for them

Automated teller machines. Public electric vehicle charging stations. Car washes, together with their entry gates and payment stations. Self-service fuel dispensers. Vending machines, parcel lockers and self-checkout terminals. Ice, water, air and vacuum vending in forecourts.

What these have in common is not the function of the machine. It is a band, strip or ring of colored light applied to the exterior of the machine, commonly in blue, violet, green or cyan, whose purpose is to make the machine conspicuous and identifiable from a distance. It is not the lighting that illuminates the keypad, the card reader, the nozzle or the screen, and the Foundation keeps the two separate throughout this subsection because its request depends on the distinction.

Appendix F.2.7 proposes code RIX for light-emitting diode strip, tape and linear accent lighting, and the entry names colored decorative strips applied to vehicle charging stations, automated teller machines and kiosks. The component is the same strip product used for cove, channel and under-cabinet lighting in the consumer and commercial classes at Part VI.F and Part VI.G. What distinguishes this class is where the strip is mounted and who stands in front of it.

2. Saturated color, and why a photometrically modest emission is radiometrically concentrated

The accent lighting in this class is predominantly saturated and narrow-band. It is produced by a diode emitting directly in the blue, violet or green rather than by the phosphor-converted white construction described at Part V.B.1, and Part V.B.3 sets out why a warm or low correlated color temperature source and a narrow-band source are different things.

The consequence is the arithmetic established at Part V.C.1, and it is the reason this class matters out of all proportion to how bright it looks. Every photometric quantity is weighted by the photopic luminous efficiency function, which is small in the blue. A stated illuminance of near-monochromatic blue light therefore corresponds to a radiometric exposure one to two orders of magnitude greater than the same stated illuminance of white light, and Part V.C.1 gives the derivation and the worked figures at two wavelengths. An installation that looks modest, and that any photometric measurement would record as modest, can deliver a short-wavelength radiometric exposure far larger than its appearance suggests. Short wavelength is the region in which the blue-light hazard function and the melanopic action spectrum are greatest, which the front matter, subsection G, sets out.

The Foundation holds one measurement of a saturated blue installation, and it is not of this class. Part VI.I.4 sets out measurements of a commercial deterrent lighting product. The Foundation does not transfer those figures here and does not suggest the two installations are comparable. It cites them for one purpose only: to establish that a measurement of this kind is straightforward, and has been made once.

A temporal characteristic attaches to many of these installations and no criterion bounds it. Color-cycling, chase, breathing and pulsing modes are standard features of the controllers these strips are sold with. Part III.E.1 states the quantities that would describe them. The Foundation has measured none of them.

3. Who is exposed, and the federal position

The exposure is at close range, for a sustained period, and is not sought. A person at an automated teller machine at night stands within about a meter of the fixture for the length of a transaction, in a dark parking area, with the eye adapted to darkness. That is the adaptation condition Part III.D.3 describes, in which a given luminance is at its most disabling, and Part III.E.4 treats the hour of use as a characteristic for that reason. A person washing a vehicle, or charging one for twenty minutes or longer, stands beside the installation longer still.

The Foundation distinguishes this class from Part VI.K on that ground. Part VI.K treats decorative, architectural and entertainment lighting, and rests in part on the proposition that the audience exposure in that class is in large part sought. Nobody approaches an automated teller machine for the lighting.

A second population is exposed and transacted nothing. These installations operate unattended through the night, in forecourts and parking areas frequently adjacent to housing, which is the light trespass subject of Part VI.P and the unnecessary-emission subject of Part II.D.3.

The federal position is that there is none. No performance standard governs the optical output of this equipment. The efficiency framework at Part IV.G does not reach the accent lighting either, because it is not a general service lamp within the definition Part IV.G.2 describes. Part VI.U is the summary table for this Part; it has not yet been built, and this class must appear in it when it is.

The Foundation states the limit of its record plainly, because the limit is substantial. It holds no measurement of any installation in this class. The incident report database at Appendix A contains no report that identifies accent lighting on self-service equipment as the source of the exposure complained of. The nearest report concerns the screen of a tabletop payment terminal in a restaurant, which is a display rather than accent trim and belongs to the class at Part VI.H. This subsection identifies a class and its characteristics. It supplies no numbers for it, and the Foundation does not represent that it has established anything about what these installations emit.

4. What the Foundation asks as to this class

That the class be included in the study and evaluation of emissions and conditions of exposure directed by § 360ii(a)(4), and that the measurement be radiometric rather than photometric, for the

reason at subsection 2: a photometric figure will understate the exposure that matters here by one to two orders of magnitude. Part IX.C.1 makes the general request.

That the code proposed at Appendix F.2.7 be assigned, so that the class has an identity in the Department's own classification. Part IX.G.7 makes the general request.

And one thing that requires no research at all. That the accent function be capable of being extinguished, or reduced, independently of the illumination function of the machine. The keypad, the card reader, the nozzle and the payment screen need light, and the Foundation does not question any of it. The colored band around the cabinet illuminates nothing. This is the technique set out at Part III.G.2 for the indicator lamp on a household device, applied to commercial equipment, and it has the same character: it asserts nothing about whether the emission is harmful, it requires no finding about anyone's health, and the capability is already present in the controllers these products use.

T. Lighting on Robots and Mobile Autonomous Devices, Including Simulated Eyes and Faces

This class appears nowhere else in this comment. Before this subsection was written the word robot did not occur in the document, no code in Appendix F corresponded to such a device, and the Foundation had located no federal criterion addressing what one may emit. It is identified here because the devices are now in the public way, and because the class is the only one in this Part that is still early enough for a criterion to precede the installed base rather than follow it.

1. What the products are, and the two emissions they carry

Sidewalk delivery robots. Food and parcel delivery devices operating on footways, campuses and hospital corridors. Floor-cleaning and inventory robots in airports, transit stations and large retail premises. Security patrol devices. And autonomous equipment on construction and agricultural sites adjacent to public space.

These devices carry two optical emissions and the Foundation separates them, because they raise different questions and only one of them is novel. The first is functional: forward lighting to illuminate the path, indicator and hazard lamps to signal presence and intended movement, and in some devices emitters used for active optical sensing. The second is expressive: arrays of light-emitting diodes arranged and animated to represent eyes, a face, or a mouth.

The functional emission raises the questions Part VI.B and Part VI.C raise for vehicle lamps, with one difference that matters. No federal lamp standard applies, because the device is not a motor vehicle. Part VI.N records the nearest comparison the Foundation has found: the federal regulation reaching bicycles requires reflective devices and does not require a lamp at all, and states no photometric limit anywhere.

2. The simulated face, which is a display designed to be looked at

The expressive emission is the novel thing in this class and it has no regulatory home. It is not a lamp performing a photometric function, and no lamp criterion describes it. It is a display, and Part VI.H treats displays, screens and personal devices.

What distinguishes it from the displays at Part VI.H is the combination of three things: it is mounted on a device that moves, at a height chosen so that it meets the gaze of a person standing or walking, and it is animated for the express purpose of attracting and holding that gaze. A person looks at simulated eyes. That is the design intent, and on the Foundation's observation it succeeds.

The consequence for exposure is specific and it is the reason this subsection exists. A person who looks directly at an emitter is exposed at the fovea, so the quantities that govern are the luminance of the emitting surface and the angle it subtends at the eye, which Part III.D.3 and Part V.B.2 set out,

rather than the illuminance at any surface. A display built to be looked at is a display whose luminance and apparent size matter, and neither is bounded for this class by anything.

Three characteristics compound in this class in a way the Foundation has not found in any other. The animation is temporal modulation whose depth, rate and waveform are chosen for expressiveness and are bounded by no criterion; Part III.E.1 states the quantities and Part III.E.2 the transition times that no instrument specifies. The device moves relative to the observer, which Part III.D.9 establishes converts a spatial pattern into temporal modulation at the retina whether or not the output itself varies. And the emission is frequently saturated color, which carries the arithmetic set out at subsection S.2.

3. Who is exposed, and the federal position

Pedestrians, who did not choose to share a footway with the device and in most places cannot decline it. People with photosensitive epilepsy, migraine and photophobia, and people with sensory processing differences, for whom Part V.E sets out the evidence and Part III.F the question of whose response a criterion is calibrated to.

And children. A device with a face is designed to be approached by children, and it succeeds at that as well. The Foundation sets one comparison beside it and asks the Department to notice the shape of it rather than to draw any conclusion from it. Part VI.M records that the federal standard governing toys in the United States does limit an optical quantity. A toy containing a light-emitting diode is subject to a limit. An autonomous machine carrying an animated face, operating on a public sidewalk where children are present, is subject to none.

The federal position, so far as the Foundation can establish, is that there is none as to emission. These devices are regulated, where they are regulated at all, by state and municipal instruments addressed to where they may operate, at what weight and at what speed. The Foundation has not surveyed those instruments and does not assert what any of them provides.

No code in Appendix F corresponds to this class. Appendix F.2 proposes thirteen codes and not one of them reaches a mobile autonomous device or an expressive display mounted on one. The Foundation identifies the gap and does not fill it in this pass.

4. What the Foundation asks as to this class

That the class be included in the study and evaluation directed by § 360ii(a)(4), and that it be taken early. The Foundation presses the timing because this is the one class in this Part where it is still available: these products are being designed now, and a criterion that exists before a product class is built is a different instrument from one that arrives after the class is installed. Part VI.R sets out what the alternative looks like, in a class converted in its entirety before anyone measured what changed.

That the expressive emission be treated as a display and measured as one, in luminance, apparent source size and the temporal quantities at Part III.E, rather than falling between the lamp rules, which do not reach it, and the display conventions, which were written for a screen a person holds or sits in front of.

That the Department consider whether a radiation-emitting product code should be assigned to the class, which is the request at Part IX.G.7 applied here.

The Foundation states what it does not ask, because the subject invites misreading. It does not ask that these devices be prohibited. It does not ask that they be required to be faceless, and it takes no position on whether a machine should present a face. It asks that what the face emits be measured, and that whatever criterion governs a display govern this one.

U. Regulatory Status by Product Class

The Foundation summarizes the regulatory position established class by class above, because the pattern is easier to see collected than distributed across twenty subsections. The classes fall into three groups.

One class has a federal standard that sets numerical limits on emission

Motor vehicle lighting. Part VI.B establishes that Federal Motor Vehicle Safety Standard No. 108 governs the photometric performance of vehicle lamps, and Part VI.B.4 that it prescribes requirements in candela for rear signal lamps. It is the only class in this Part of which that is true. What it does not limit, for any lamp, is the luminance of the emitting surface, the spectral content of the emission, the depth or frequency of temporal modulation, or the rise and decay times of a signal.

Several classes have a federal instrument that sets a floor and no ceiling

The visible alarm, where Part VIII.D.4 establishes that the flash rate is bounded in both directions and the intensity is bounded only below. The warning and flashing lamps at Part VI.C, where the governing manual specifies flash rates and intensity classes as minima. Aviation and obstruction lighting at Part VI.O and marine navigation lighting at Part VI.Q, where the applicable instruments prescribe minimum luminous intensity. Traffic control signals at Part VI.R. In each, a federal or federally adopted instrument states how much light the device must produce and none states how much it may not exceed.

The remaining classes have no federal instrument reaching the optical emission at all

Roadway, area and parking lighting at Part VI.D. Interior lighting in schools, workplaces and healthcare settings at Part VI.E, and retail and commercial interiors at Part VI.F. Consumer lamps and household products at Part VI.G. Displays, screens and personal devices at Part VI.H, where Part VI.H records that this Department has classified the products and that one class is defined by an undefined term. Security and deterrent lighting at Part VI.I. Signage and dynamic message displays at Part VI.J. Decorative, architectural and entertainment lighting at Part VI.K. Products intended for or used by children at Part VI.M. Bicycle and personal mobility lighting at Part VI.N. Residential exterior lighting and light trespass at Part VI.P, where Part III.D.5 records that the maxima which exist are municipal and state. Accent lighting on unattended self-service equipment at Part VI.S and on mobile autonomous devices at Part VI.T.

Two statements complete the summary. Appendix F sets out the product codes this Department has assigned, twenty-three of them, and the thirteen the Foundation proposes, and records for each class whether a code reaches it; a code is an administrative classification and not a limit, which Part II.B.6 establishes. And Part VIII.D.1 establishes the proposition this summary is evidence for: no performance standard prescribed under § 360kk governs the visible light emitted by any light-emitting diode product in any of these classes.

V. Tariff Classification and Import Screening of LED Products

Every product class described in this Part arrives in the United States, in whole or in part, as an import. At the moment of arrival each one is assigned a number, and that number determines whether this Department sees it at all. This subsection sets out how that works, because it is the one place in the federal system where a light-emitting diode product is routinely identified to this Department as a radiation-emitting electronic product, and because the mechanism appears to have a gap in it that the Foundation can describe but has not been able to resolve.

1. The Harmonized Tariff Schedule, and who writes it

The Harmonized Tariff Schedule of the United States is the tariff law of the United States. It was enacted by section 1204(a) of the Omnibus Trade and Competitiveness Act of 1988, Pub. L. 100-

418, 102 Stat. 1148, which struck the former tariff schedules from 19 U.S.C. § 1202. That section is now a heading carrying editorial notes and no operative text, and the schedule itself is not printed in the United States Code. It is maintained and published by the United States International Trade Commission, an independent agency created by the act of September 8, 1916, 39 Stat. 795, and renamed by section 171 of the Trade Act of 1974, 19 U.S.C. § 2231. The Commission is directed by 19 U.S.C. § 3005 to keep the schedule under continuous review and to recommend modifications, and by § 3007 to publish it; changes of the kind described below are made by presidential proclamation under § 3006. Customs and Border Protection administers it, and is established in the Department of Homeland Security by 6 U.S.C. § 211. Neither the Commission nor Customs is a health agency and neither writes this Department's regulations.

A tariff number has ten digits and they are not all of one kind. The first six are international, taken from the Harmonized System of the World Customs Organization and common to the great majority of trading nations. The seventh and eighth are a legal subdivision of the United States and fix the rate of duty. The ninth and tenth are a statistical suffix used for reporting, and they are set under section 484(f) of the Tariff Act of 1930, 19 U.S.C. § 1484(f), which directs the Secretary of the Treasury, the Secretary of Commerce and the Commission to establish the statistical enumeration; Part II.H.1.d sets out why that matters to this comment. The Foundation sets that out because the distinction matters to what follows: the first six digits are changed by an international body on a periodic cycle, and the United States follows.

2. How this Department uses the tariff schedule

This Department attaches flags to tariff lines. A flag on a line tells the filer that an article classified under it may be subject to this Department's requirements and that entry data is expected. The data itself is transmitted in the Automated Commercial Environment under 21 C.F.R. part 1, subpart D, added by the final rule at 81 Fed. Reg. 85,854 (Nov. 29, 2016), and includes the complete FDA Product Code, which for a diode illumination lamp is the code reproduced at Appendix F.1.11. Importation of electronic products is separately governed by 21 U.S.C. § 360mm, by 21 C.F.R. part 1005 and by 19 C.F.R. §§ 12.90 to 12.91, and the declaration is made on Form FDA 2877, Declaration for Imported Electronic Products Subject to Radiation Control Standards.

The chain is therefore complete and it is worth stating plainly. An international body writes the heading. The Commission publishes the schedule. This Department flags the line. The importer files the product code. Customs admits or refuses the article. Part II.H.20 describes that relationship as the Department itself has described it, and Part II.B.6 the classification it rests on.

3. The instruction of June 6, 2017, and the line it drew

On June 6, 2017 Customs and Border Protection published CSMS 17-000330, Light-Emitting Diode (LED) Reporting to FDA, relaying an update from this Department. It stated that "LED products emit visible optical radiation, which qualifies them to be radiation-emitting electronic products" and instructed that entry data was expected for light-emitting diodes used for general or local area illumination, such as lamps and lightbulbs, classified under tariff number 8541.40.2000 and flagged accordingly. It further instructed that entry data was not expected for finished products using light-emitting diodes only as indicator lights, such as toys, telephones, appliances and remote controls.

The Foundation makes two observations and resists a third. The first is that the instruction is operative rather than advisory: it told importers what this Department expected to receive, and the expectation rested on the characterization of visible optical radiation as electronic product radiation. The second is that the line it drew, between illumination and indication, is a line of administrative convenience at the border and is not a line this comment adopts; Part VI.G treats the appliance indicator at length, and the class is in any event classified under its own product code, reproduced at Appendix F.1.20. The observation the Foundation resists is that the exclusion of indicator products from entry reporting amounts to a determination that such products fall

outside 21 U.S.C. § 360hh(1)(A). Nothing in the message says so, and an instruction about what data an agency wishes to receive should not be read back into the statute as a jurisdictional line.

4. The tariff number in that instruction designated a different article, and has since ceased to exist

Subheading 8541.40 was a subheading of the international Harmonized System and it was divided in the 2022 revision of that system. New subheadings 8541.41 through 8541.49 were created and light-emitting diodes are now provided for at 8541.41. The Foundation records why the division was made, because it bears on how little attention the relocation is likely to have received: the new subheadings were created to provide for solar energy products, on a proposal of the International Renewable Energy Agency, and the separation of light-emitting diodes into a subheading of their own was incidental to that purpose. The revision took effect in the United States on January 27, 2022, under Proclamation 10326 of December 23, 2021, 86 Fed. Reg. 73,593 (Dec. 28, 2021), which incorporated the modifications set out in Publication 5240 of the United States International Trade Commission.

The specific number the message of June 6, 2017 gave, 8541.40.2000, no longer exists, and the Foundation does not rest that on a commercial tariff database. Proclamation 10339 of February 4, 2022, 87 Fed. Reg. 7,357 (Feb. 9, 2022), amended a note of the schedule by deleting 8541.40.60 and inserting 8541.42.00 in its place, and by deleting 8541.40.6025 and inserting 8541.42.0010. The United States Trade Representative deleted 8541.40.95 from another note by notice of October 14, 2022. And Customs and Border Protection told the trade, in a message of October 18, 2022 numbered CSMS 53676546, that the 8541.40 numbers it listed no longer exist, in light of changes to the schedule made by the Commission in accordance with Proclamation 10326.

There is a second difficulty with that number, and it is the more serious of the two because it does not depend on anything having changed. The message described light-emitting diodes used for general or local area illumination, such as lamps and lightbulbs. Heading 8541 is the semiconductor heading: it covers semiconductor devices, photosensitive semiconductor devices and light-emitting diodes as such. Finished lamps are not there and were not there in 2017. They are in heading 8539, which in the revision in force when the message issued read, in its closing words, light-emitting diode (LED) lamps, and carried subheading 8539.50 for them. The 2022 revision changed those closing words to light-emitting diode (LED) light sources and divided 8539.50 into 8539.51 for modules and 8539.52 for lamps, the distinction resting on whether the article has a cap allowing it to be installed in or replaced within a luminaire.

So the position is not that an instruction was overtaken by a change in the nomenclature. It is that the tariff number on which this Department's entry screening for light-emitting diode illumination products was keyed designated the component rather than the lamp, at a time when the nomenclature already carried a subheading for the lamp, and that the number has since been deleted as well.

The Foundation asks rather than asserts, and states its questions precisely. Whether an import flag of this Department presently attaches to any subheading of heading 8539, and to 8539.52 in particular. Whether one ever did. Whether a flag was carried across from 8541.40.2000 to 8541.41 in January 2022, and if so what articles it is now understood to reach. And what entry data this Department presently expects for a finished light-emitting diode lamp imported for general illumination. If the arrangement is in good order the Department can say so in a few sentences. If it is not, then the only routine mechanism by which a light-emitting diode illumination product is identified to this Department as a radiation-emitting electronic product does not work, and nobody has said so.

The Foundation states the limit of its own research rather than leaving it to be discovered. It has read the headings and subheadings of the nomenclature of the World Customs Organization, which the United States follows at the six-digit level, and the federal instruments recited above. It has not been able to read the printed article descriptions of the Harmonized Tariff Schedule itself,

or the ten-digit statistical reporting numbers beneath the subheadings discussed, because the Commission's schedule could not be retrieved in the working environment in which this comment was prepared. The six-digit descriptions above are therefore given from the international nomenclature with which the schedule must conform, and not from the schedule. This Department and Customs and Border Protection can read both.

One fact makes the question current rather than historical, and the Foundation puts it last because it is the one that matters. This Department's own public instruction to importers, on its page concerning the importation of radiation-emitting electronic products, presently reads:

> For additional information on reporting LEDs to FDA, review the CSMS message that was issued on June 6, 2017.

That is the operative published guidance. It directs an importer to a message whose only tariff number was deleted from the schedule on January 27, 2022, and whose number, while it existed, designated the semiconductor component rather than the lamp. The Foundation does not infer from this that no screening occurs, and it does not suggest that the guidance was written carelessly; it was accurate as to the message it described. What it observes is that the guidance has not been revised in the four years since the number it depends upon ceased to exist, and that a program which had looked at its own import mechanism in that period would have noticed. Part II.H.20 describes this arrangement as the program's one sustained liaison of record with another federal agency. The Foundation does not withdraw that description. It asks the Department to state what the present arrangement is.

Two features of the question make it worth asking in this forum rather than elsewhere. It is answerable from this Department's own records and requires no research, no standard and no new authority. And the answer bears directly on paragraph 360ii(a)(4), because entry data is a source of information about what is entering the country and in what volume, and Part V.J describes at length how little this Department is shown to know about either.

VII. REPORTS OF HARM

A. The Soft Lights Foundation LED Incident Report Database [RFI Q3]

1. Method of collection and the submission form

The existence of the form and the Foundation's practice of transmitting what it collects are described at Part IV.B.1. This subsection describes the instrument itself, because the shape of the data in Appendix A follows from it and four other subsections of this Part depend on what the form captured.

Each reproduced report in Appendix A carries four elements and no others: a date, a location, a condition category, and a narrative written by the reporter. The Foundation describes each as the reproduced record shows it.

The date. Every one of the 593 reports carries a date in a single uniform form, which indicates a date captured or normalized by the system rather than typed by the reporter. Where a reporter writes a date inside a narrative it appears in whatever form that reporter chose, and those forms vary; the header dates do not.

The location. This was not a constrained field. Of the 593 entries, 547 take the form of a place followed by a two-letter state abbreviation, 33 give a place and a country, 9 have three elements, and 4 consist of a single word, among them USA, Japan, Netherlands and Anonymous. Two entries give a United States place with the state name written out in full where the great majority abbreviate it. Several reporters entered Anytown. No menu of states or countries could produce that range, so the location was entered by the reporter as free text and some reporters used it to withhold their location rather than to give it.

The condition category. Every one of the 593 reports carries at most one value. No entry in the dataset contains two categories, a separator or a conjunction, so a reporter who had more than one relevant condition could record only one of them. Eight reports carry no value at all, so the field was not required. Part VII.A.4 sets out the distribution.

The narrative. Free text, with no length limit apparent in the result. The median report runs to about 480 characters, a quarter run to 260 or fewer, twenty-four exceed 2,000, the longest runs to 5,464, the shortest to 8, and one report has no narrative at all. Part VII.B explains how these narratives were grouped and Appendix A reproduces every one.

The form collects no name, no street address, no telephone number and no electronic mail address. That is the primary protection of the reporters' privacy and it is a property of the instrument rather than of anything the Foundation did afterwards. Part VII.A.6 describes the screening applied to what the form did collect.

One feature of the record that the Foundation cannot explain, and states because it bears on the figures

The condition values are not distributed as a wholly unconstrained text field would distribute them. Two hundred and fifty-seven of the 593 entries fall on exactly two strings, Other and None, and the remainder fall on a further eight. Free text would ordinarily produce many more variants than that.

But four entries do carry variant spellings of three of the categories: two give Electromagnetic Sensivity where twenty-six give Electromagnetic Sensitivity, one gives None with a terminal period, and the three entries for Sjogren syndrome appear under two spellings. The Foundation tested whether those variants cluster in time, which would indicate a label on the form that was misspelled and later corrected. They do not. The correctly spelled entries run from August 2024 to the end of the period and the variants fall in November 2025 and June 2026, interleaved with them; the two spellings of Sjogren both appear in August 2024.

The Foundation therefore states a negative finding rather than an explanation. At some point in the chain between the reporter and the reproduced record, the condition value was not constrained by a fixed list. It cannot say from the reproduced record whether the form offered free text, offered a list with an alternative, or whether the variants were introduced later when the reports were compiled for transmittal. The consequence for the reader is the one that matters: the table at Part VII.A.4 is a table of the values recorded in the 593 reports, and not a table of the options the Foundation offered. Nothing in Appendix A discloses which options existed and were never chosen.

2. Transmittal of the reports to the FDA and NHTSA, and the agencies' acknowledgments

Part IV.B sets out the transmittal record in full and this subsection does not repeat it. The transmittals to the Food and Drug Administration were made to the customer service address of the Center for Devices and Radiological Health, periodically, from April 2024 onward; the letter of December 1, 2025 was addressed jointly to the Commissioner of Food and Drugs and to the Administrator of the National Highway Traffic Safety Administration; and the acknowledgments returned are the subject of Part IV.B.3. Part IV.B.8 carries the transmittal table.

One consequence belongs here rather than there, because much of this Part depends on it, and the Foundation states it with the precision it requires. The reports in Appendix A were not collected for this comment. They were collected as they arrived over two and a half years and transmitted to the Department periodically as they arrived. The great majority were therefore in the Department's own records before this request for information issued. The most recently received reports were not, because the form continued to receive them after the request issued and the latest in Appendix A is dated October 14, 2026; those come before the Department for the first time in this comment.

The distinction matters for one argument and not for the rest. Where this comment submits that the Department cannot answer without addressing material it already held, that submission runs only to the reports transmitted before the request issued. The remaining reports are offered as what they are, which is information supplied in response to a request for information. Part IV.B.7 states what follows from the former and Part VII.A.5 states what the whole dataset does and does not establish.

3. Volume, date range, and geographic distribution

The database contained 593 reports as at October 14, 2026. The earliest bears the date April 21, 2024 and the latest October 14, 2026. Appendix A reproduces all 593 in full, in chronological order, numbered A.1 to A.593.

Distributed by calendar year, with the first and last years partial:

2024, from April 21: 233 reports.

2025, the only complete year: 218 reports.

2026, to October 14: 142 reports.

The Foundation states a consequence of those figures that is not favorable to it, because a reader will compute it. Expressed as a daily rate the three periods run at approximately 0.9, 0.6 and 0.5 reports a day, so the rate of reporting has fallen across the period. The Foundation cannot attribute that decline to anything and does not know its cause. It notes only that the rate at which members of the public find and complete a voluntary form maintained by a small organization is a fact about the form and its visibility, and is not evidence about the incidence of the experiences reported. The same is true of the increase that would have appeared had the numbers run the other way. Subsection 5 sets out the limits of this dataset in full, and this is one of them.

Geographic distribution

Of the 593 reports, 540 give a location ending in a United States state or District abbreviation, and those 540 are distributed across 46 states and the District of Columbia. Two further reports give a United States location with the state written out, and are not counted in the table below. Forty-five reports give locations outside the United States. Six give locations that cannot be placed, being two entered as Anytown, USA, two as Anytown, NA, one as USA and one as Anonymous; the Foundation reads the first four as reporters withholding their own locations, and has not altered them.

Six states are not represented at all: Mississippi, North Dakota, South Dakota, West Virginia, Wyoming, and no report was received from Puerto Rico or any other territory.

Table. Reports by United States state or District, n = 540

State	n	State	n	State	n
California	107	Illinois	35	Pennsylvania	31
Texas	30	New York	28	Florida	23
Ohio	23	Oregon	22	Washington	21
Michigan	20	New Jersey	16	North Carolina	14
Colorado	12	Massachusetts	12	Maryland	11
Minnesota	11	Wisconsin	10	Arizona	8
Georgia	8	Tennessee	8	Maine	7
South Carolina	7	Indiana	6	Oklahoma	6
Virginia	6	Alaska	5	New Hampshire	5

State	n	State	n	State	n
New Mexico	5	Alabama	4	Connecticut	4
Idaho	3	Iowa	3	Missouri	3
Montana	3	Utah	3	Vermont	3
Delaware	2	District of Columbia	2	Hawaii	2
Kansas	2	Kentucky	2	Nevada	2
Rhode Island	2	Arkansas	1	Louisiana	1
Nebraska	1				

The reports from outside the United States come from fifteen countries and territories. Canada supplies 17, the United Kingdom 8, New Zealand 6, Australia and the Netherlands 2 each, and France, Guadeloupe, Japan, Jamaica, Malaysia, Norway, Poland, Russia, Serbia and Sweden 1 each. The Foundation includes them because they were received, and draws no inference from them about conditions in the United States. They bear on this proceeding in one respect only, which Part VI.V develops: the products described are supplied by the same manufacturers into the same global market.

4. Self-identified condition categories recorded by reporters

The submission form invites the reporter to select a condition category. The categories are the reporter's own selection, made about themselves, from the choices the form presents together with a free Other. They are not diagnoses, no clinician reviewed them, and the Foundation has not verified any of them. Subsection 5 states what follows from that and subsection 6 describes the screening the Foundation applies.

Across the 593 reports the categories are distributed as follows.

Table. Self-identified condition categories, n = 593

Category as recorded	n	Share of 593
Other	130	21.9%
None	128	21.6%
Migraine	99	16.7%
Astigmatism	90	15.2%
Autism	54	9.1%
Photophobia	43	7.3%
Electromagnetic Sensitivity	28	4.7%
Epilepsy	10	1.7%
(none entered)	8	1.3%
Sjogren's	3	0.5%

Four features of that distribution should be stated before anything is made of it.

The two largest entries carry the least information. Other and None together account for 258 of the 593, which is more than two fifths. Other records that the reporter did not find their condition in the list, and None records that the reporter claimed no relevant condition at all. Neither tells the Department anything about a condition, and the second is in one respect the more interesting of the two, because 128 people who reported an effect from light-emitting diode products did not attribute it to any condition of their own.

The categories are not of one kind. Astigmatism is a refractive condition of the eye, migraine and epilepsy are neurological, autism is a developmental condition, photophobia is itself a symptom rather than a diagnosis, and Sjogren's syndrome is an autoimmune disease. The list mixes mechanism, diagnosis and symptom, which is a feature of how the form was built and not of the population.

Spelling variants have been consolidated and the consolidation is stated so that a reader recounting from Appendix A reaches the same totals. Two reports give Electromagnetic Sensivity and are counted with Electromagnetic Sensitivity; one gives None. with a period and is counted with None; and the three entries for Sjogren's syndrome appear under two spellings. The reproduced reports in Appendix A retain whatever the reporter entered.

Eight reports record no category. They are counted in the 593 and shown in the table as none entered.

The Foundation draws one observation from the table and no more. The categories most often selected after Other and None are migraine at 99 and astigmatism at 90, and those two conditions are the ones for which a mechanism connecting them to this kind of light source is best described in the published literature: photophobia and photic trigger in migraine, treated at Part V.E, and the effect of refractive error on the retinal image of a small, high-luminance source, treated at Part V.C.3 and Part V.C.5. That the self-selected categories and the mechanisms described in the literature point the same way is worth the Department's attention. It is not proof of anything, for the reasons subsection 5 gives, and the Foundation does not present it as proof.

5. What the database establishes, and what it does not

This subsection is the one the Foundation asks the Department to read before relying on anything in Parts VII.B through VII.F. Those subsections state figures, and figures invite a reader to treat them as measurements. These are not measurements. The Foundation sets out what the database establishes, which is narrow, and then what it does not establish, which is a longer list and includes several things that count against the Foundation.

What the database establishes

Three things, and the Foundation claims no more than these.

That 593 people took the trouble to find a form, complete it and describe an experience they attribute to light emitted by light-emitting diode products, between April 21, 2024 and October 14, 2026. That is a fact about the reports and it is not in dispute.

What those people said. The accounts are reproduced in full in Appendix A, so the primary material is before the Department and every figure in this Part can be recounted against it.

That the great majority of this material was in the Department's possession before this request for information issued, having been transmitted periodically as it arrived in the manner Part IV.B records. The reports received after the request issued, of which the latest is dated October 14, 2026, are before the Department for the first time in this comment; Part VII.A.2 draws the distinction and explains which argument depends on it. As to the material the Department already held, it is not receiving that for the first time, and a response which does not address it is not a response made in ignorance of it.

What the database does not establish

Six things, in the order of how much each matters.

It is not a sample of any population. Every report is self-selected. The reporters found the form because they were already looking for somewhere to report, which means they had already concluded that light was the cause of what they experienced. No inference about the general population can be drawn from a set assembled that way, and the Foundation draws none.

There is no denominator. The Foundation does not know how many people encountered the conditions described and were unaffected, because it has no means of counting them. Every

figure in this Part is a numerator with nothing beneath it. No rate, prevalence, incidence or risk can be computed from this database, and the Foundation has computed none.

Five hundred and ninety-three reports are not 593 people. The form collects no identifier, so the Foundation cannot establish how many distinct individuals are represented. The 593 reports carry 445 distinct location entries, and several locations recur in a pattern that suggests repeated submission by the same person: one location supplies 29 reports, another supplies 6 all in the same condition category, and one reporter states in the body of a report that they had submitted an earlier one. The number of distinct reporters is therefore smaller than 593 and the Foundation cannot say by how much.

No report is verified. The Foundation has no authority to request a medical record, to contact a clinician, to inspect a product, to measure an emission or to visit a location. It has not attempted to confirm any account, and Part VII.J explains why it could not. Where a reporter asserts that light-emitting diode products caused a condition, that is the reporter's statement of their own belief and the Foundation does not adopt it.

The geographic distribution is not representative, and one feature of it requires particular disclosure. Part VII.A.4 records 54 reports in the autism condition category. Thirty-one of those 54 come from Yolo County, California and the adjacent Sacramento area, which is where the Foundation's officers are located and where the Foundation has conducted local advocacy. A reader should treat the autism figure as reflecting the Foundation's own locality and network and not a national pattern, and should treat the condition-category distribution in Part VII.A.4 generally as shaped by where the form was known about.

The method detects acute encounters and is poor at detecting chronic exposure. Part VII.B.5 sets this out in full. The effect with the strongest support in the scientific literature, which is circadian and sleep disruption, is the effect least often reported here, and the Foundation believes that is a property of the instrument rather than of the world.

What follows

The Foundation does not ask the Department to treat these 593 reports as proof that light emitted by light-emitting diode products injures people. They are not capable of proving it and the Foundation does not advance them for that purpose.

It asks for two things, and both are consistent with every limitation above.

The first is that the reports be answered rather than passed over. A body of 593 particularized accounts in an agency's possession is a part of the record before that agency, whatever its evidentiary weight, and an explanation which does not mention it is not a reasoned explanation of a decision not to act. Part II.H.20 sets out the authority for that proposition and it is the Foundation's principal submission on this Part.

The second is that the Department build the instrument that would answer the question properly. Every defect listed above is a consequence of who is doing the collecting. A private organization cannot establish a denominator, cannot verify a clinical account, cannot compel a measurement and cannot reach a population that does not already suspect the cause. This Department can do all four. The Foundation therefore offers this database not as a substitute for federal surveillance but as the reason for it, and Part VII.J and Part IX.D make the request.

6. Screening of reports for personally identifiable and health information

The Foundation describes the screening it applied, because a body of 593 first-hand accounts of personal experience placed on a public docket requires it and because the Department should know exactly what was and was not done.

What the instrument itself prevents

The first and most important protection is a property of the form rather than of any later screening: it never collected a name, a street address, a telephone number or an electronic mail address. Part VII.A.1. There is accordingly no contact detail in the dataset to remove.

What the Foundation searched for, and what it found

The Foundation searched the full reproduced text of all 593 reports as they appear in Appendix A. The results were as follows.

Electronic mail addresses and telephone numbers: none. No report in the dataset contains either.

Web addresses: eighteen, across fourteen reports. Most are references to published research or to news coverage and are left as the reporters gave them. One was different in kind and has been removed, as described below.

Personal names: the great majority of capitalized name-like terms in the dataset are places, vehicle makes, retailers, utilities, public officials or public figures, and those are left. Four entries required a decision about an identifiable individual.

The four entries, and what was done

The Foundation sets these out individually rather than describing them in general terms, because a reader who finds one of them should be able to see that it was considered.

One report named a private individual as the owner of a light, asserted that she had defamed the reporter on a social media platform, and included a web address that appeared to be devoted to her by name. The name and the web address have been removed and the possessive now reads as a bracketed description of the relationship, which marks the alteration on the face of the entry. The remainder of the report stands as written. The Foundation has not investigated the dispute the report describes and expresses no view on it, and it did not consider it right to place a private person's name, or a link to material about her, into a federal docket inside an allegation to which she is not a party.

One report names the reporter's own optometrist, as a doctor, and attributes to him a clinical confirmation of the effects described. That is a named private professional credited with a professional opinion that he has not been asked to confirm.

One report contains what appears to be the reporter's own name, volunteered together with an invitation to search for it.

Two reports contain the name of the Foundation's president, and one of those a further personal name.

Health information, which is a different question

The reports contain self-reported health information throughout, and the Foundation has not removed it. That is not an oversight and the Foundation states the reasoning rather than leaving it to be inferred. The health information is the substance of the reports. Each reporter wrote it for the purpose of having it reach a federal agency, and each report was in fact transmitted to the Food and Drug Administration in the form in which it appears here. Part IV.B. To strip it would be to reproduce nothing.

The Foundation has added nothing. It holds no medical record for any reporter, has sought none, has not contacted any clinician, and has not sought to confirm or to elaborate any account. Part VII.A.5. The condition categories are the reporters' own selections about themselves and are not diagnoses.

One residual risk should be stated because the Foundation cannot eliminate it. A location and a condition together may be identifying where the location is a small community, even though neither element alone identifies anybody and no name is given. The Foundation has retained city

and state because the geographic distribution at Part VII.A.3 is responsive to the Department's question and because a report without a location cannot be assessed, and it judges the residual risk acceptable on that footing. A reporter who wished to withhold a location could and did do so, as Part VII.A.1 records.

No report in the dataset is identifiably from a person under eighteen. Part VII.K.

B. Reported Effects, by Category [RFI Q3.c, Q3.d]

This subsection groups the reported effects. Before the groups, the Foundation states how the grouping was done, because the method bears on what the figures are worth and a reader is entitled to test both.

The 593 reports are free text. No reporter selected an effect from a list; each wrote a description. To group them the Foundation searched the reproduced text of Appendix A for defined terms, which are given with each group below, and counted the reports in which a term appears. Four consequences follow and the Foundation states all four.

A report may appear in several groups. The groups are not exclusive and the figures must not be added together.

This is a word search and not a clinical classification. Nobody with medical training coded these reports, and the Foundation makes no claim that the groups correspond to diagnostic categories.

The method undercounts. A reporter who describes being unable to see without using any of the searched words is not counted, and the Foundation has not attempted to count such reports.

The method also overcounts, because a searched term may appear in a negation, in a description of somebody else, or in a sentence about a different subject. The Foundation has not excluded such instances, so each figure should be read as the number of reports in which a word appears rather than as the number of people who had the experience.

Every figure below is therefore recountable against Appendix A, which is the reason the reports are reproduced in full. The Foundation presents these as counts of what the reports say. It does not present them as prevalence, as incidence, or as a rate of anything, and Part VII.A.5 states why no such figure can be derived from this dataset.

1. Ocular pain, glare, afterimage, and temporary loss of vision

This is the largest group by a wide margin. Terms searched: blind, blinds, blinded, blinding, blindness; glare, glares, glared, glaring, glary; eye pain, eyes hurt, eyes ache, eyes burn, eyes sting, pain in or behind the eyes; afterimage, seeing spots, spots in my vision; and the phrases cannot see, could not see, unable to see, momentary blindness, and vision goes white or black. At least one such term appears in 341 of the 593 reports, which is 57.5 percent.

Within that group the individual term counts are:

a form of the word blind, 267 reports;

an inability to see, stated in one of the phrases listed above, 80 reports;

a form of the word glare, 67 reports;

pain or burning in the eyes, 29 reports;

an afterimage or spots in the visual field, 25 reports.

The first of those figures is the single most important number in this Part. A form of the word blind appears in 267 of 593 reports, which is 45 percent, and it is the word the reporters reached for more often than any other. Three examples give its ordinary use.

"Makes me blind and hard to see road. Especially oncoming traffic when the lights are elevated higher than me."

— Appendix A, A.4 (Dallas, Texas, April 23, 2024)

> “LED headlights are blinding to the point where I have almost hit deer and other vehicles because I cannot see when the LED lights are coming at me”
> — Appendix A, A.21 (Marshfield, Wisconsin, April 28, 2024)

> “Momentary blindness is caused when hit with bright LED lights. Which in effect can cause a car accident either with another vehicle or pedestrian.”
> — Appendix A, A.274 (Phoenix, Arizona, March 9, 2025)

The Foundation reads that word as the reporters plainly mean it, and the reading is both the honest one and the one that matters. They are not asserting permanent loss of sight. They are describing a temporary inability to see, during and shortly after exposure to a bright source. That is not a lay exaggeration of a clinical condition. It is a description of disability glare, which is a measurable optical phenomenon with an established photometric treatment, and Part V.C.3 sets out that treatment and the quantities that govern it, veiling luminance and intraocular straylight among them. The reporters are describing, in their own words, the effect that the published literature predicts from a small source of high luminance.

The Foundation asks the Department to hold that figure against the proposition in the Final Response of May 24, 2024 that light-emitting diode products have a long history of safety with respect to the visible wavelengths they emit. Part I.C.7. Two hundred and sixty-seven people in the Department’s own possession used the word blind to describe what these products did to them. Whatever answer the Department gives to this comment, the Foundation asks that it be an answer which addresses those reports rather than one which does not mention them. Environmental Health Trust holds that an agency may not satisfy its obligation by saying nothing at all about the specific effects in the record before it. Part II.H.20.

2. Headache and migraine

Terms searched: headache, headaches, head ache; migraine, migraines. At least one appears in 164 of the 593 reports, which is 27.7 percent. A form of the word migraine appears in 118 reports and a form of headache in 73.

One comparison within the data is worth the Department’s attention. Ninety-nine reporters selected Migraine as their condition category, as Part VII.A.4 records, but 118 reports mention migraine in the narrative. The narratives therefore describe migraine more often than the category was selected, which means some reporters who did not identify themselves as migraine sufferers described migraine as an effect. The Foundation does not press the point further, because the categories permitted only one selection so far as it is aware and a reporter with both migraine and astigmatism could record only one of them. Part VII.A.4.

> “Instant trigger of chronic migraines. Can’t even function at all.”
> — Appendix A, A.44 (Kuala Lumpur, Malaysia, May 28, 2024)

> “Poorly designed LED lights impact my health severely. Flickering LED lights induce migraine headaches, and this affects my health nearly every day. Overly bright LED headlights and street lights impair my night vision and make driving more dangerous.”
> — Appendix A, A.93 (Beaverton, Oregon, August 5, 2024)

The second of those reports names the characteristic treated at Part V.D, which is temporal modulation of the emitted light rather than its intensity alone, and which Part V.E connects to the neurological and photosensitive responses at issue here. Ninety-nine of the 593 reports use a form of the words flicker, pulse, strobe or flash. The Foundation draws attention to that figure because a performance standard addressed only to brightness would not reach what those ninety-nine reports describe, and Part IX.I accordingly asks for a standard that addresses modulation as well as magnitude.

3. Seizure and photosensitive response

Terms searched: seizure, seizures; epilepsy and its forms; convulsion and its forms. At least one appears in 31 of the 593 reports, which is 5.2 percent. A form of the word seizure appears in 23 reports and a form of epilepsy or convulsion in 13.

This group requires more care than any other in this Part, and the Foundation states its limits before its contents. Ten reporters selected Epilepsy as their condition category, as Part VII.A.4 records, while 31 reports mention seizure, epilepsy or convulsion. The excess is not evidence that light-emitting diode products caused seizures in twenty-one additional people. On reading the reports, the excess is accounted for by three things: reporters describing a sensation they liken to a seizure without asserting that one occurred; reporters expressing fear that a seizure might occur; and reporters mentioning epilepsy in connection with somebody else, or in general terms. The Foundation has not attempted to separate those uses and does not rely on the figure of 31 for any proposition about seizures having occurred.

Two reports illustrate the character of the group.

> "Debilitating headaches, dizziness and seizure like response when exposed to LED lighting. Increased sensitivity to any lighting type after prolonged exposure in LEDs."
> — Appendix A, A.41 (Portage, Michigan, May 25, 2024)

> "Causes nervous system dysregulation which impacts motors skills & orientation, migraines, seizures, nausea, ability to digest food, vomiting"
> — Appendix A, A.136 (Brooklyn, New York, October 11, 2024)

The first says seizure like response and not seizure, and the Foundation quotes it in that form for that reason. The second asserts a causal relationship which the Foundation does not adopt. Part VII.A.5 states the general position and it applies with particular force here: these are the reporters' accounts of their own experience and the Foundation advances them as nothing else.

What this group does bear on is a matter of regulatory structure rather than of causation, and on that the Foundation does rely on it. Photosensitive seizure response to modulated light is not a disputed phenomenon. It is the reason the Access Board's guidelines cap the flash rate of visible alarm appliances, and the reason the Board's own technical assistance warns that flash rates above 5 Hz may trigger seizures and that composite rates above 5 Hz should be avoided. Part VIII.D.4. The Department is therefore not being asked to accept a novel mechanism. It is being asked why the one federal scheme that addresses this mechanism caps the rate of flashing while leaving the intensity of the flash with a floor and no ceiling, and why no comparable limit of any kind applies to the light-emitting diode products these 31 reports describe.

4. Acute autonomic and panic responses

Terms searched: panic; anxiety, anxieties, anxious; palpitation and its forms, racing heart, heart rate, heart racing, heart pounding. At least one appears in 46 of the 593 reports, which is 7.8 percent. A form of anxiety appears in 26 reports, panic in 22, and a cardiac description in 4.

The Foundation identifies the objection to this group before presenting it, because the objection is obvious and reasonable. Distress on encountering a stimulus one expects to be painful is a response to anticipation, and does not by itself establish that the stimulus acts on the body in any particular way. A reader may therefore set this group aside as describing a reaction rather than an effect. The Foundation does not contest that reading for the group as a whole.

Two reports are nevertheless worth the Department's attention, for different reasons.

> "I was standing in a room and another person's cell phone buzzed with a message notification. The iPhone also pulsed its LED camera flash, which struck me in the eyes. I fell to my knees, breathing hard, and trying to fight off a panic attack."
> — Appendix A, A.28 (Roseville, California, April 30, 2024)

That report describes an exposure the reporter did not anticipate and could not have anticipated, from a consumer product in a domestic setting, at an emitted power far below anything a headlamp produces. The anticipation objection does not reach it. It bears on Part VI.H, which concerns displays, screens and personal devices, and on the fifth matter at Part IX.I, because the product that caused it is not one any performance standard presently addresses in respect of its optical output.

> "Full fledged anxiety because being blinded puts me into fight or flight adrenaline mode, because if I am not vigilant I could crash. LED lights are so bright, I cannot see in front of me, beside, or behind me. I am not at fault for being blinded, they are at fault for blinding me."
> — Appendix A, A.246 (Scappoose, Oregon, January 13, 2025)

The second report sets out its own causal chain, and the chain runs the other way from the objection. The reporter does not describe fear of the light. The reporter describes loss of vision, and then describes the physiological response to driving a vehicle while unable to see. On that account the anxiety is downstream of the ocular effect in Part VII.B.1 and of the traffic consequence in Part VII.E, and it is reported as such by the person who experienced it.

5. Sleep disruption

Terms searched: sleep and its forms, sleepless, sleeplessness, insomnia; circadian; melatonin. At least one appears in 28 of the 593 reports, which is 4.7 percent. A form of sleep or insomnia appears in 22 reports, and circadian or melatonin in 6.

This is the smallest symptom group in this Part, and the Foundation draws the Department's attention to that fact rather than passing over it, because it is the most informative thing about the group and it is adverse to any attempt to read this dataset as a general measure of harm.

Disruption of sleep and of circadian regulation by short-wavelength light at night is the best-established effect in the whole of the literature reviewed at Part V. It has a known photoreceptor, a known action spectrum, a dose-response relationship, and a body of controlled human experiment behind it, and it is the one effect on which the Foundation would expect no serious scientific dispute. Part V.F. It is also the effect least often mentioned in these 593 reports.

The Foundation offers the explanation it believes to be correct, and it is a limitation of its own instrument rather than a finding about the world. This form collects accounts of encounters. A person blinded by an oncoming headlamp knows the moment it happened, knows what caused it, and has something to report. A person whose sleep has been degraded over years by the spectrum of a bedroom lamp or a streetlight outside the window has no moment to report, may not connect the two at all, and has nothing to enter in a form that asks what happened and when. The effect with the strongest scientific support is therefore the one this method is worst at detecting.

Two of the 28 illustrate the chronic pattern when it does appear.

> "I have a difficult time sleeping from all of the LED lights. I get very agitated and irritated since they came out. I really dislike how the blue street lights make me feel."
> — Appendix A, A.433 (Decatur, Georgia, December 24, 2025)

> "My bathroom light flickers and it makes my eyes hurt. Lights have bothered me for years and I have had trouble sleeping for years and taken medication but no help. I'm convinced that LED's are my problem but I'm having trouble getting replacements. I feel stuck."
> — Appendix A, A.491 (Bonney, Wisconsin, February 5, 2026)

The consequence for this proceeding is the one Part VII.J develops. A voluntary form run by a small organization cannot detect a chronic, cumulative, low-grade exposure, and no amount of care in its design would make it able to. Detecting that requires a surveillance system with a defined population and a denominator, which is what the Foundation asked the Centers for Disease Control and Prevention to begin building on March 3, 2023 and what it asks for again at Part IX.D. The gap in this group is the argument for that request.

6. Cognitive effects, fatigue, and nausea

Terms searched: nausea and its forms, vomit and its forms, queasy; dizzy and its forms, vertigo, lightheaded; disorient and its forms, confused, confusion, brain fog; fatigue, fatigued, exhausted, exhaustion. At least one appears in 71 of the 593 reports, which is 12.0 percent. Nausea or vomiting appears in 34 reports, dizziness or vertigo in 18, disorientation or confusion in 18, and fatigue or exhaustion in 14. A form of the words concentrate or focus appears in 29 reports, and the Foundation records that figure separately because those words are also used in these reports in an optical sense, of the eye focusing, and the count cannot be relied on as a measure of cognitive effect.

Three reports in this group are worth setting out, because each has a feature that the others in the dataset mostly lack.

> "Council lawnmower with flashing LED lights drove past me while I was walking along the road. I felt immediate severe head pain, nausea and discoordinated, and fell into the roadside ditch. I then vomited, climbed out with blurred vision and pounding head."
> — Appendix A, A.69 (London, United Kingdom, August 1, 2024)

That report describes a physical injury, immediately following a defined exposure to a flashing emitter, to a pedestrian who was not driving and was not seeking the encounter. The sequence is specific as to time, place and source. The Foundation does not assert that the light caused the fall, because it cannot; it observes that the reporter does, and that this is the kind of account which a reporting system with authority to investigate could resolve and which the Foundation has no means of resolving. Part VII.J.

> "I became extremely nauseated and experienced a headache immediately upon entering Target and Safeway after they had just switched from fluorescent bulbs to led bulbs. I experience eye pain from led headlights and streetlights and have to shield my eyes wherever I go. I feel agitated around led lights at night."
> — Appendix A, A.207 (King County, Washington, December 17, 2024)

The second report describes a change in the reporter's response following a change in the lighting technology of a fixed place, the lighting being the variable the reporter identifies. Part VI.F concerns retail and institutional lighting, and reports of this shape bear on it in a way that reports about traffic do not.

> "The LED lights at work make me feel tired with difficulty concentrating after a few hours. The other work site does not have LED lighting so I am able to compare. I turned down an offer for more hours at work only because of the way the lighting there at the site with LED makes me feel too drained by end of work day."
> — Appendix A, A.563 (Sonoma County, California, August 19, 2026)

The third is the most useful single report in this group, for two reasons. The reporter describes a comparison between two workplaces differing in their lighting, which is the nearest thing to a controlled observation that an uncontrolled dataset contains. And the reporter describes declining additional paid hours because of the lighting, which is an economic consequence in an employment setting. That bears on Part VII.F, and on Part VIII, where the obligations of employers under Title I of the Americans with Disabilities Act are considered, because an employee who reduces their hours to avoid a workplace condition has suffered something the law recognizes even where no diagnosis is in evidence.

7. Reported radiofrequency interference from LED products

This heading was written in anticipation of a group of reports that the dataset does not contain, and the Foundation states the finding rather than filling the heading.

Terms searched: radiofrequency, radio frequency; electromagnetic; EMF; wifi, wi-fi; dirty electricity. At least one appears in 2 of the 593 reports. Both of those two are reports whose

authors selected Electromagnetic Sensitivity as their condition category, and there are 28 such reports in the dataset. So of the 28 reporters who identified themselves as electromagnetically sensitive, 26 described their experience of light-emitting diode products without referring to radiofrequency or electromagnetic fields at all.

Three conclusions follow and the Foundation states each of them against its own interest where that is where they fall.

> There is no body of reports in this dataset about radiofrequency emission from, or radiofrequency interference by, light-emitting diode products. The Foundation does not advance any claim of that kind from this database, and nothing in Part II or Part V of this comment concerning radiofrequency rests on it.
>
> The condition category Electromagnetic Sensitivity therefore functions in this dataset as a label a reporter applied to themselves at the form, and not as a description of what the reporter went on to report. That is a defect in the Foundation's form, which offered a category that the narratives do not populate, and Part VII.A.1 should be read with that in mind. Those 26 reports describe the same ocular, head and somatic effects as the rest of the dataset.
>
> One of the two reports that does mention radiofrequency also contains assertions about published medical findings which the Foundation has not verified, does not adopt, and believes to be inaccurate, including an assertion about a position taken by a national medical association in 2016. The report is reproduced in Appendix A unaltered, for the reason the scope note to that appendix gives, and the Foundation draws attention to it here so that no reader supposes the Foundation relies on it. It does not.

The Foundation has left this heading in place, rather than removing it, because the absence is itself responsive to the Department. This request for information concerns electromagnetic radiation across its range. A reader coming to this Part might reasonably expect a collection of reports connecting the two subjects, and the honest answer is that the Foundation collected 593 accounts of harm from visible light and two of them mention radiofrequency. The Foundation's submission on visible light does not depend on any connection to radiofrequency, and Part I.B explains why it is advanced on its own footing.

C. Reported Exposure Sources and Conditions [RFI Q3.a, Q3.b]

This subsection answers the Department's questions as to the sources of exposure and the conditions under which it occurs. The figures are produced by the method stated at the head of Part VII.B, and the same four limitations apply: the groups are not exclusive, the counts are of reports in which a term appears, and the method both undercounts and overcounts for the reasons given there.

What the reporters say the light came from

One source dominates the dataset. A term from the set headlight, headlights, headlamp, headlamps, high beam, high beams, highbeam or brights appears in 280 of the 593 reports, which is 47.2 percent. The remaining sources, with the terms searched, are:

- streetlight, street lamp or road light: 60 reports;
- a retail or commercial interior, searched as store, stores, supermarket, grocery, restaurant, shopping or the name of a national retailer: 53 reports;
- a household lamp or fixture, searched as bulb, bulbs, light bulb, indoor light, or a named room of the reporter's own home: 50 reports;
- a security light, floodlight, motion-activated light, porch light or a light belonging to a neighbor: 35 reports;
- an emergency vehicle, searched as police, fire truck, ambulance, emergency vehicle, squad car or patrol car: 35 reports;
- a parking lot, stadium or sports field installation: 16 reports;

a taillight, brake light or daytime running lamp: 11 reports;

a bicycle, electric bicycle or scooter lamp: 10 reports;

a cell phone or camera flash, or a handheld flashlight: 8 reports;

a billboard, digital sign or illuminated sign: 5 reports.

The Foundation draws the Department's attention to the first figure, because it determines what this dataset is and bears directly on the central argument of Parts II and IV. Nearly half of the 593 accounts of harm that the Foundation has placed in the Department's possession concern motor vehicle headlamps. Those are products whose photometric requirements are set by the National Highway Traffic Safety Administration under Federal Motor Vehicle Safety Standard 108, and that agency has twice stated that questions about the health effects of the light they emit belong to this Department. Part II.H.21. This is therefore not a dataset that sits at the margin of the jurisdictional question. It is a dataset substantially composed of reports about the single product class that lies across the boundary, and it is the evidentiary basis of the liaison duty the Foundation asks the Department to perform. Part IX.A.

The Foundation also records what this dataset does not contain, because the omission runs against the litigation history described at Part IV. Terms for pedestrian crossing beacons, searched as RRFB, rectangular rapid flashing, rapid flash, crosswalk, crossing light, pedestrian beacon and school zone, appear in only 8 of the 593 reports, and the word beacon appears in 2. Proceedings concerning rectangular rapid flashing beacons have been brought by Mr. Baker in his individual capacity and are described at Part IV and Part VIII. They do not rest on this database, which is overwhelmingly a record of headlamps, area lighting and interior lighting, and the Foundation does not advance this database in support of them.

The conditions the reporters describe

The same method yields the following for circumstances:

a form of the verb drive appears in 345 reports, 58.2 percent, so the dataset is predominantly a record of exposures encountered while driving;

darkness, searched as at night, nighttime, after dark, evening or dark, appears in 260 reports, 43.8 percent;

an oncoming or approaching source, searched as oncoming, approaching, coming at me, facing me or head-on, appears in 109 reports, 18.4 percent;

a source behind the reporter, searched as behind me, rear-view, in my mirror or tailgating, appears in 78 reports, 13.2 percent;

walking or being on foot appears in 47 reports, 7.9 percent;

rain, snow, fog or a wet road surface appears in 38 reports, 6.4 percent.

Two of those conditions deserve separate comment because neither is addressed by any existing federal requirement, and the Foundation returns to both at Part IX.I.

The first is light arriving from behind. Seventy-eight reports describe being affected by the lamps of a following vehicle, by way of the rear-view or side mirrors.

> "I get temporarily blinded when oncoming vehicles have their bright LED lights on, it's hard to drive when being blinded from both in front and behind with the glare of bright led headlights reflecting off both my left side mirror and rear-view mirror."
>
> — Appendix A, A.257 (Richmond, Rhode Island, February 6, 2025)

> "I am 39 with no known vision issues but I keep being blinded by LED headlights in front and behind me. It makes it really hard to see and drive safely at night. LEDs commonly used in new cars are way too bright. I had to pull in my left side mirror and this makes me scared to drive at night."
>
> — Appendix A, A.187 (Cranston, Rhode Island, December 1, 2024)

A headlamp standard regulates the beam a lamp projects forward. It does not address what that beam does after reflecting from the mirrors of a vehicle in front, and the Foundation is aware of no federal requirement that does. Seventy-eight reporters describe exactly that path, and the second of the two above describes the mitigation it forced, which was to disable a mirror required for safe operation of the vehicle.

The second is the number of sources present at once. Eighty-three reports mention a truck, a sport utility vehicle or a pickup, and five describe in terms the lamp being mounted higher than the reporter's own eye position. The Foundation states the smaller figure as well as the larger because only the smaller supports a claim about mounting height. The point it does support is the one developed at Part IX.I: the quantity a person experiences is produced by the geometry of the encounter and by the number of emitters in the scene, and a performance standard expressed as a property of one lamp measured alone does not reach it.

D. Reported Avoidance and Mitigation, and Its Effect [RFI Q3.f]

The Department asks what those affected do about it. The reports describe seven kinds of response, and the Foundation sets out the figures and then the feature they share.

Physical shielding, searched as shield, block, hand up, hand over, visor, look away or avert: 54 reports.

Tinted or filtering eyewear, searched as sunglasses, tinted glasses, tinted lenses, polarized or blue-light blocking: 36 reports.

Altering the route or interrupting the journey, searched as side road, side street, back road, different route, another route, pulling over or pulling in: 30 reports.

Confining travel to daylight: 17 reports.

Covering windows, searched as blackout, curtains, window film or window covering: 8 reports.

Consulting a clinician or taking medication, searched as doctor, optometrist, ophthalmologist, neurologist, medication or prescription: 40 reports.

Stating expressly that a measure did not help, searched as does not help, did not help, no help, nothing helps or does not work: 7 reports.

The Foundation asks the Department to notice what every item on that list has in common. Each is a measure taken by the person exposed, at that person's own cost and inconvenience, to reduce an emission that somebody else produces. Not one of them acts on the source. That is the distribution of burden which the minimizing purpose of paragraph (a)(2) exists to correct, and Part I.B.3 and Part IX state the Foundation's submission on it.

Three of the reports show what the measures cost, and the Foundation sets them out because the figures above do not convey it.

> "I have to hold one hand w/ a newspaper, and bring down my visor, the rear view & side mirrors to block all LED headlights. This makes it very difficult to see any traffic hazards. If the light does hit my eyes, i get a piercing pain back to my optic nerve worse than a migraine."
> — Appendix A, A.95 (Culver City, California, August 6, 2024)

> "I almost hit a car while trying to shield my eyes from an oncoming car with bright lights. …"
> — Appendix A, A.260 (Baltimore, Maryland, February 15, 2025)

> "Bright LEDs make it hard to drive at night. It's blinding and unsafe for me and the public. Sometimes sunglasses help but I shouldn't wear those at night"
> — Appendix A, A.77 (Chicago, Illinois, August 3, 2024)

The first two describe the same thing from opposite ends. A driver who shields their eyes with a hand, a newspaper, a visor or a disabled mirror has reduced the light reaching the retina by reducing the field of view available for driving, and the first reporter says so expressly. The second

reporter describes the collision that nearly resulted. The third states the contradiction in the most common mitigation of all: the measure that reduces the glare is one the reporter knows should not be used at night, because it reduces the light available from everything else as well.

The Foundation accordingly asks the Department to treat these responses as evidence of the magnitude of the exposure rather than as evidence that it has been managed. A mitigation that degrades the function it is meant to protect is not a solution to the problem; it is a measure of how large the problem is. The further consequences, where mitigation fails or is abandoned, are at Part VII.E and Part VII.F.

E. Reported Traffic Safety Consequences

A substantial part of this dataset is about road safety, which is a subject this Department does not regulate and on which it has no view. The Foundation sets the material out for two reasons. It is responsive to the Department's question as to reported harms. And it is the material that the agency which does regulate the product has twice declined to treat as within its remit, on the ground that the health effects of the light belong here. Part II.H.21. The reports in this subsection are the ones that fall in the gap between the two positions.

1. Collisions and near-collisions attributed to glare

Terms searched: collision, collisions, crash, crashed, crashes, rear-end, rear-ended, swerve and its forms, ran off the road, car accident, auto accident, nearly hit, almost hit, nearly crashed, almost crashed, near miss. At least one appears in 36 of the 593 reports, which is 6.1 percent.

The Foundation states the limitation of that figure before relying on it. These are self-reported accounts. No police report, insurance claim or crash record is attached to any of them, the Foundation has not verified any, and in most cases the reporter describes an event that was avoided rather than one that occurred. The figure is a count of reports using those words and nothing more.

> "LED headlights are blinding to the point where I have almost hit deer and other vehicles because I cannot see when the LED lights are coming at me"
> — Appendix A, A.21 (Marshfield, Wisconsin, April 28, 2024)

> "Momentary blindness is caused when hit with bright LED lights. Which in effect can cause a car accident either with another vehicle or pedestrian."
> — Appendix A, A.274 (Phoenix, Arizona, March 9, 2025)

What the Foundation does advance from this group is not a crash statistic. It is the sequence the reports describe, which is consistent across them and is the sequence the photometric literature predicts: a bright source enters the field of view, vision is degraded for a period, and the driver continues to operate the vehicle during that period because the vehicle does not stop. Part V.C.3 sets out the measurement of that degradation, Part V.C.4 the discomfort component, and Part VI.B the vehicle lamps at issue. The Department is not asked to accept any figure about collisions. It is asked to notice that the mechanism the reports describe is a known one, and that 36 reporters describe reaching the point where it nearly or actually produced a crash.

2. Pedestrian and cyclist incidents

Terms searched: walking, on foot, pedestrian, cyclist, cycling, biking, riding my bike, on my bike. At least one appears in 37 of the 593 reports, which is 6.2 percent. This group matters disproportionately to its size, for a reason the Foundation states plainly: a pedestrian or a cyclist struck by a vehicle has no protection, and a pedestrian who is blinded cannot reduce the consequence by slowing down, because the hazard is the vehicle and not their own speed.

> "Everyday I walk and ride bikes in my neighborhood and the local area, and everyday there are headlights so bright that I can't see anything around me. I have almost ridden into parked

> cars, tripped on the curb, and narrowly missed avoiding other vehicles because LED headlights are so bright that nothing else is visible."
> — Appendix A, A.473 (Oklahoma City, Oklahoma, January 10, 2026)

> "I can not walk outside after dusk without LED lights from cars blinding me when I walk on the sidewalk. I have to wear sunglasses when there no sun out. I have to cover my eyes. I've litrally walked into other people before because I CAN'T SEE due to LED headlights blinding me."
> — Appendix A, A.587 (Burlington, Vermont, October 4, 2026)

Both reports describe collisions on foot or on a bicycle, with fixed objects, with the curb and with other people, caused by inability to see. Neither reporter was operating a vehicle. The Foundation draws the connection to Part VIII: a person who cannot cross a street or walk on a sidewalk after dark because of the lighting on it has lost the use of a pedestrian facility, and the loss is of the same kind that Part VIII addresses under the Americans with Disabilities Act, whether or not the person has a diagnosis.

The Foundation records one further matter for completeness and does not rely on it. One report in the dataset consists substantially of a reference to a published news account of a pedestrian fatality, submitted by a member of the public who attributes the death to lighting. The Foundation has not investigated that attribution, does not adopt it, and advances nothing from it. It is reproduced in Appendix A because this comment reproduces every report received.

3. Cessation of night driving

Terms searched: stopped driving, quit driving, no longer drive or driving, ceased driving, refuse to drive, will not drive, cannot drive, can't drive, avoid driving. At least one appears in 45 of the 593 reports, which is 7.6 percent.

This is the most consequential figure in Part VII.E and the Foundation asks the Department to consider why. The 36 reports at subsection 1 describe a risk that materialized or nearly did. These 45 describe people who removed themselves from the road to avoid it. They are not, on their own accounts, people who have been injured. They are people who have given up an activity.

> "Can no longer drive at night due to extremely bright LED headlights blinding me. I have no health issues that would cause sensitivity to bright light"
> — Appendix A, A.173 (Hickory, North Carolina, November 24, 2024)

> "Because of super bright LED lights, I can no longer drive at night. My eyes are very sensitive to that horrible brightness and I had to change my life around this problem. I had to look for a job where my schedule is not ending at night. …"
> — Appendix A, A.82 (Greenville, South Carolina, August 3, 2024)

The first of those two is worth the Department's particular attention because of its second sentence. The reporter states expressly that they have no condition which would explain sensitivity to bright light. Part VII.A.4 records that 128 of the 593 reporters selected None as their condition category, and this is what a number of those reports look like. Whatever the Department concludes about susceptible populations, a portion of this record consists of people who describe themselves as ordinary and describe the emission as the variable.

The second shows the shape of the consequence. The reporter changed employment to avoid driving at night. That is the same consequence as the workplace report at Part VII.B.6 reached by a different route, and it belongs with the material at Part VII.F.

The Foundation makes one argument from this group and confines itself to it. A person who stops driving at night does not appear in any crash statistic, in any injury register, or in any adverse event system. The avoidance is invisible to every instrument the federal government operates, and it is invisible precisely because it was successful. Forty-five reports in this dataset describe it. The Foundation does not know how many people it would describe in a population, and says so at Part

VII.A.5, because it has no denominator. That is the argument for the surveillance capability requested at Part IX.D, and it is the answer to any suggestion that an absence of recorded injury is evidence of an absence of harm.

F. Reported Loss of Access to Public Accommodations, Employment, and Community Life

The reports describe consequences beyond the road, and this subsection sets out what they are. The figures are smaller than those in Part VII.B and the Foundation does not inflate them.

- Fourteen reports state that the reporter cannot, or no longer does, go to, shop at or enter a place, searched as cannot go, can't go, avoid going, stopped going, no longer go, cannot shop or cannot enter.
- Eleven reports describe remaining indoors or ceasing to go outside, searched as stay home, stay inside, stay indoors, no longer go out, housebound or homebound.
- Twenty reports mention the reporter's own workplace or job in connection with the lighting, and two describe a specific employment consequence: declining additional hours, and changing employment to avoid night driving.
- Eleven reports use the language of isolation, social life, community or church.

Three reports show the character of the loss, and each concerns a different kind of place.

> "They installed led lights in my favorite library. The overhead light is so bright, I can't read the spines of the books on the shelves. It hurts my eyes and gives me a migraine to even look toward the shelves. I need polarized sunglasses to enter the library!"
> — Appendix A, A.386 (Readington, New Jersey, November 16, 2025)

> "Big box stores with LED lights make me sick. It is blinding bright and I can't shop. Costco, marshalls, TJ Maxx, grocery stores, LED lights are in most stores. The only way to shop in person is to wear sunglasses and a rollenz eye shield. The lights are flickering and too bright."
> — Appendix A, A.535 (Chicago, Illinois, June 12, 2026)

> "I have to take a rescue medication to go outside at night due to led spotlights, headlights, signs, street lamps, stop lights, and flashlights since they all trigger severe migraines that leave me bedridden without rescue meds and taking the meds too frequently is bad for your health so i avoid going out after dusk."
> — Appendix A, A.578 (Port Angeles, Washington, September 19, 2026)

The first concerns a public library, which is a facility of a public entity and is therefore within Title II of the Americans with Disabilities Act. The second concerns retail premises, which are places of public accommodation within Title III. The third describes the cost of access in the most concrete form the dataset contains, which is a dose of medication taken in order to leave the house after dark.

The Foundation connects this subsection to Part VIII and states the connection carefully, because the legal argument there does not depend on these reports and these reports do not establish the legal argument. What they supply is the factual predicate that Part VIII assumes: that there are people for whom the lighting of an ordinary public place is the thing that excludes them from it. Part VIII then addresses the separate question of what obligations follow, and the answer there turns on the statutes and not on this dataset.

One observation belongs here rather than in Part VIII. In each of the three reports above the reporter identifies a remedy that was available and was not adopted, and in each case it is a property of the installation rather than of the person: a different lamp, a lower output, a different spectrum, the absence of visible modulation. The reporters are not asking for the library or the store to be closed. They are describing a specification. The absence of any federal specification to point to is the subject of Part VIII.D and the reason the Foundation asks for one at Part IX.I.

G. The Petition to Ban Blinding Headlights

The Foundation maintains a public petition to the United States Department of Transportation to limit the intensity of vehicle headlamps, hosted on a third-party petition platform, together with the public comment thread attached to it. Appendix B reproduces that thread.

The Foundation states the evidentiary character of both before relying on either. The signatures are self-selected and unverified. The platform applies no identity check that the Foundation can attest to, the signatories are not a sample of any population, and a signature establishes only that a person signed. Part VII.A.5 states the equivalent limitations of the incident reports and the Foundation applies the same standard here, as Part IV.B.5 does in recording what was transmitted to the agencies.

The comment thread is the part with evidentiary value, and it has that value for a reason unconnected with the number of signatures. Appendix B contains 4,991 contiguous public submissions, each carrying a date and the place the commenter entered, in which members of the public describe in their own words what these products do to them. The Foundation does not count them, does not treat them as a survey, and does not assert that they establish any rate of anything. It reproduces them because they are a body of contemporaneous public description of an exposure that no federal body collects, which is the point Part VII.J makes about the whole of this Part.

The Foundation states no signature count in this comment. Any figure stated would be out of date by the time the comment is read, and Part IV.B.5 records the position taken when totals were transmitted to the agencies.

H. Other Public Reporting Channels

1. NHTSA consumer complaint records

The National Highway Traffic Safety Administration operates a public complaint system for motor vehicles and motor vehicle equipment. It matters to this Part for a reason that has nothing to do with the Foundation: nearly half the reports in Appendix A concern motor vehicle headlamps, Part VII.C, and that agency has twice told the Foundation that the health effects of the light they emit lie with this Department, Part II.H.21. What the other agency has recorded about the same subject is therefore directly relevant, and it has recorded a great deal.

What that agency has said about the complaints it receives

In the final rule of February 22, 2022 amending Federal Motor Vehicle Safety Standard No. 108 to permit adaptive driving beam headlamps, the agency described its own concern about glare and the basis for it. The Foundation quotes the agency's words rather than summarizing them.

> the thousands of complaints NHTSA has received from the public on the issue.

That appears at 87 Fed. Reg. 9919. A footnote earlier in the same document refers to "the numerous complaints from the public it has received," 87 Fed. Reg. 9917 n.1, and the agency elsewhere describes "increased consumer complaints in the late 1990s" in connection with newer headlamp technologies, 87 Fed. Reg. 9919.

The Foundation asks the Department to hold that figure against the proposition in the Final Response of May 24, 2024 that light-emitting diode products have a long history of safety with respect to the visible wavelengths they emit. Part I.C.7. Another federal agency, writing two years earlier in the Federal Register, recorded thousands of public complaints about the light emitted by one class of those products. The Foundation does not suggest that the Department knew of that passage. It observes that the passage is in the Federal Register, that the subject is a product class this Department has classified as emitting electronic product radiation, Part II.B.6, and that § 360ii(a)(3) directs the Secretary to receive information from other federal agencies.

The same agency has described two of the effects this Part documents

Two further passages in that rule describe, in the agency's own words, effects that Part VII.B and Part VII.E record from the reports.

> Headlamp illumination can glare drivers of oncoming or preceding vehicles.

87 Fed. Reg. 9918. The agency adds that this can occur by way of the rear-view or side mirrors. Part VII.C records 78 reports describing exactly that path, including one reporter who disabled a side mirror to cope with it. The mechanism is not disputed by anybody.

> discomfort caused by glare may induce some drivers, particularly older drivers, to avoid driving at night.

87 Fed. Reg. 9919. Part VII.E.3 records 45 reports describing the cessation or avoidance of night driving. The Foundation had set that material out before locating this sentence, and draws attention to the correspondence: the behavior the Foundation documents from first-hand accounts is the behavior the responsible agency had already described in a rulemaking.

One difference between the two accounts is the whole of this comment's subject. That agency characterizes the mechanism as discomfort and annoyance. It does not discuss health effects; the Foundation has read the document and there is no such discussion in it. So the position is that the agency which regulates the lamp treats the consequence as discomfort, and the Department which holds the health mandate has not examined it at all. That is the gap, described from both sides of it.

What the complaint system can and cannot capture

The Foundation states a structural limitation of that complaint system, because it bears on what the thousands of complaints can and cannot be taken to establish, and because it is the same limitation this comment identifies in the Department's own reporting channel.

The system is a defect reporting system. Its purpose is to identify a defect in an identified product so that a remedy or a recall may follow, and its categories are organized accordingly, by vehicle, tire, equipment and child restraint. Two consequences follow for the harm this Part describes.

- The person harmed is usually not the owner of the product. A driver blinded by an oncoming vehicle, and still more a pedestrian, has no make, model or model year to give, because the vehicle has gone. The Foundation has found no category or field in that system for a person affected by a lamp on a vehicle that is not theirs.
- A compliant headlamp is not a defect. Where a lamp meets the photometric requirements of Standard No. 108 and nevertheless blinds an observer, a defect system has nothing to act on, because nothing has failed. Part VII.I.1 identifies the same problem in the Department's own regulation, where the definition of an accidental radiation occurrence requires the event to be accidental and the product is performing as designed. Both federal reporting channels are built around malfunction, and the harm described in Appendix A arises from products working exactly as built.

The Foundation accordingly does not offer the thousands of complaints as a measure of anything. It offers them as proof that the information exists, in federal hands, in volume, and has existed for years.

The proceeding now open, and what this Part adds to it

A second federal proceeding on this subject is open as this comment is filed, and Part II.H.5 sets it out in full: the negotiated rulemaking to modernize Federal Motor Vehicle Safety Standard No. 108, announced on October 6, 2026 and noticed at 91 Fed. Reg. 64462 on October 8, 2026, Docket No. NHTSA-2026-1981, with comments and applications for membership due November 9, 2026 and headlamp glare among the announced subjects. Part II.H.5 states the liaison consequence and Part IX.E.4 states the request. This subsection does not repeat either.

Two details of the notice belong here, because they concern the record of reported harm rather than the liaison duty. The first is the composition of the committee that is to be assembled. The notice provides for up to eighteen members, allocated as four from vehicle lighting manufacturers or lighting retailers, two from national motor vehicle manufacturers, four from national motor vehicle or motor vehicle equipment manufacturing associations, two from national motor vehicle or motor vehicle equipment safety organizations, three from educational, research or testing institutions, and three from national professional engineering or standard setting associations.

The Foundation sets out the arithmetic of that allocation and draws no inference about anybody's motives. Ten of the eighteen seats are allocated to manufacturers, retailers and manufacturing associations. No seat is allocated to a federal health agency, to a clinical body, to a disability organization, or to the people on whom the light falls. Part II.H.5 makes the same observation about the categories and notes that the agency may expand them.

The second detail is what the notice does not contain. It does not mention the Food and Drug Administration, this Department, or the health effects of light, and it does not mention glare to pedestrians. The reports in Appendix A include 47 from people who were walking rather than driving, Part VII.C, and the pedestrian and cyclist incidents at Part VII.E.2 describe collisions on foot. The proceeding that will revise the photometric requirements for these lamps has not, on the face of its notice, identified that class of affected person at all.

2. FDA reporting mechanisms and their treatment of these reports

The Department's own channels are examined at Part VII.I, which sets out the definition of an accidental radiation occurrence, the reporting duty at 21 C.F.R. § 1002.20, the absence of any provision requiring the Department to do anything with a report once received, and the Foundation's own submissions. Part II.L examines the same regulation from the statutory side. This subsection records only what belongs here, which is the comparison.

The Department does have a channel. A member of the public may submit an accidental radiation occurrence report on Form FDA 3649, and the form offers optical as one of its four radiation types. Part VII.I.4. In the letter of May 23, 2019 described at Part II.D.5 the Center stated that it receives and refers complaints of this kind, and Part VII.J.1 accepts that account and records that the Foundation used that route.

The difference between the two agencies is therefore not that one has a channel and the other does not. Both have one. The difference is in what has been recorded. The other agency has published, in the Federal Register, that it has received thousands of complaints from the public about the light emitted by one class of these products. Part VII.H.1. This Department has published no figure at all, and the Foundation has been unable to establish from any public source how many reports concerning visible light from light-emitting diode products it has received, from manufacturers or from anybody else. Part VII.I.4 asks for that figure and Part II.L.3 asks for it in the statutory context.

The Foundation states what it does not infer from that silence. It does not infer that no reports exist, and it does not infer that reports received were disregarded. Section 1002.4 restricts disclosure of information obtained under part 1002, Part VII.I.4, and the absence of a published figure may be explained by that provision, by the absence of any obligation to publish one, or by there being nothing to publish. The Foundation cannot distinguish between those explanations and asks the Department to.

3. Local government complaint records

Sixteen of the 593 reports describe the reporter approaching a city, a county, a borough council, a public works department, a utility or a state utility commission. The Foundation sets this material out because it is the only part of this Part concerning a channel that actually responds to people, and because what the reports describe happening there is the subject of Part VIII arriving from below.

> “Excessively bright, unshielded lights are being set up over the city, some residential, some commercial. Despite being against code, the City does not effectively address the issue. …”
> — Appendix A, A.98 (Knoxville, Tennessee, August 7, 2024)

That report describes a local code that exists and is not enforced. The Foundation makes no finding about the code or the city, and has not examined either.

> “… I for one am tired of the blue lights that I have been told are "broken" in my own township of Springfield, OR. No one seems to care that something that is considered "broken" has gone unfixed. I have shared my concerns with the local officials, anywhere from the Mayor's chat on Instagram to directly contacting our local electric company, SUB, who is in charge of them. The message is "we're working on it", "be patient with us", "this was approved", "it's gonna be fine", "we'll fix things when we can". And here we are two years later and the "broken" blue lights have remained. …”
> — Appendix A, A.280 (Springfield, Oregon, March 24, 2025)

> “… My city is REFUSING to do ANYTHING to bring back ANY form of AMBER streetlights. I've contacted the city AND state A LOT! And they won't do anything. I've even tried contacting the DOT of the state and he won't even be much help. …”
> — Appendix A, A.64 (Albuquerque, New Mexico, July 15, 2024)

The second and third describe the exhaustion of local channels, in the second case extending to the electric utility and in the third to the state transportation department. Two further reports from one reporter in a Pennsylvania borough describe a council that resolved to install whatever lamps the power company supplied and directed the reporter to the state public utility commission.

What these reports show about the absence of a standard

The Foundation draws one conclusion from this group and it is not about any local government. A city councillor, a public works director or a utility engineer asked to do something about a light has no federal number to apply. There is no federal limit on the luminance, the radiance, the irradiance or the spectral distribution of a visible-light emitter in the general environment, Part I.C.7, so a local official who wants to act is obliged either to invent a criterion or to decline. Part VIII.D sets out the same absence as it affects a public entity’s obligations under the Americans with Disabilities Act, and Part VIII.G sets out what a federal performance standard would supply to such an official.

That is the practical case for the relief sought at Part IX.I, and it is independent of everything this comment says about harm. A federal performance standard would not merely protect the people who wrote these reports. It would give the thousands of local officials who must choose lamps a number to procure against, which none of them has now.

I. These Reports Describe Accidental Radiation Occurrences Under 21 CFR 1000.3(a)

1. The regulatory definition — 21 C.F.R. § 1000.3(a)

Part II.L sets out the definition at 21 C.F.R. § 1000.3(a) and examines its three operative features: that the exposure need only be potentially injurious, that the occurrence may arise from the use of an electronic product, and that the events must be accidental. This subsection does not repeat that analysis. It applies the definition to the 593 reports.

The first two elements are satisfied on the face of the reports

As to potentially injurious exposure, the question is not close. The definition does not require demonstrated injury, and 341 of the 593 reports describe an ocular effect, 164 describe headache or migraine, and 39 describe a collision or near collision. Part VII.B and Part VII.E. Whatever

those reports establish about causation, they describe exposures that were at least potentially injurious on any ordinary reading of the phrase.

As to use, the definition reaches an occurrence arising from the manufacturing, testing or use of an electronic product. The exposures these reports describe arise from products in use: a headlamp illuminating a road, a luminaire lighting a store, a lamp in a bathroom. Part VII.C. The definition is not confined to malfunction and the Foundation does not need it to be.

The third element is the difficulty, and the Foundation states both sides

The word accidental is doing work, and Part II.L concedes that a headlamp emitting exactly as it was designed to emit is not obviously the subject of an accident. The Foundation does not retreat from that concession. It makes two observations which bear on how far the concession goes.

The first is textual. The definition speaks of an accidental event or series of accidental events that has resulted in injurious or potentially injurious exposure. It does not say that the product must have failed, malfunctioned or departed from its design. What must be accidental is the event, and an event may be accidental in the ordinary sense because it was unintended and unanticipated by the person it happened to, even though every component worked as built. One report in the dataset makes the point better than argument:

> "I was standing in a room and another person's cell phone buzzed with a message notification. The iPhone also pulsed its LED camera flash, which struck me in the eyes. I fell to my knees, breathing hard, and trying to fight off a panic attack."
> — Appendix A, A.28 (Roseville, California, April 30, 2024)

Nothing failed. A telephone did what telephones do. Whether that is an accidental event is a question the Foundation puts rather than answers, and it is a question about the meaning of the Department's own regulation.

The second observation is that a portion of the dataset does not depend on the point at all, because it describes products not performing as intended. Ninety-nine reports use a form of the words flicker, pulse, strobe or flash, and visible flicker in a product intended to emit steady light is a departure from intended performance rather than an instance of it. Part V.D. Other reports describe lamps aimed above the horizontal, lamps left on an upper beam, and fixtures installed otherwise than as designed. For those reports the accidental element is not strained.

The Foundation accordingly does not contend that all 593 reports describe accidental radiation occurrences. It contends that some do on any reading, that many more do on a reading of accidental that attends to the event rather than to the equipment, and that the Department has never said which reading it applies. The consequence of that silence is the subject of the two subsections below.

2. Form FDA 3649 reports concerning LED light

The Foundation has made at least one such report. On October 14, 2022 it submitted to the Food and Drug Administration a radiation report concerning light-emitting diode lamps mounted on an emergency vehicle. The agency assigned the report case number COR22000194.

Two things follow, and the Foundation states them without embellishment. A channel for reporting optical radiation from these products to the agency existed and was used. And the agency received the report and assigned it a number, so the submission is in the Department's own records and is capable of being retrieved by that number.

What the Foundation cannot say is what was done with it. No determination has been communicated to the Foundation, no finding has been published, and the records bearing on the agency's handling of reports of this kind are among those sought in the action described at Part IV.D.3.

3. What the agency is required to do with such a report

The Foundation examined the regulation to establish what happens to a report once it arrives. The answer is the finding of this subsection, and it is a negative one.

What the regulation requires of the person reporting

Section 1002.20 was amended in its present form in January 2023. It directs a manufacturer who has reasonable grounds to suspect an accidental radiation occurrence to report it to the Director of the Center for Devices and Radiological Health, and it provides that reasonable grounds may rest on documented professional, scientific or medical facts or opinions. It specifies what the report is to contain, so far as known: the nature and location of the incident, the product, the circumstances and suspected causes, the persons affected and the nature of their exposure or injuries, any corrective action, and other pertinent information. It requires immediate reporting of an occurrence associated with a death or serious injury, and permits other occurrences to be reported immediately or compiled into a quarterly summary with a trend analysis and planned mitigations.

The Foundation draws attention to two features of that scheme because they are favorable to the use the Department could make of it. The threshold is suspicion on reasonable grounds, not established causation. And the quarterly alternative expressly contemplates aggregation and trend analysis, which is to say that the regulation already envisages this information being treated as a body rather than as isolated incidents.

What the regulation requires of the agency

Nothing. The Foundation states that plainly because it is the point. Part 1002 contains no provision requiring the Department to review a report received under § 1002.20, to investigate it, to respond to it, to acknowledge it, to publish it, to aggregate it, or to act upon it. The duties in the part run to manufacturers, to dealers and to distributors. The only provision in the part addressed to the Secretary is § 1002.4, and it is a restriction rather than a duty: it provides that the Secretary shall not disclose information reported to or otherwise obtained by him pursuant to the part.

The Department's own guidance is consistent with that reading. The page describing how to submit these reports states that manufacturers discovering a safety problem associated with radiation emission are required to notify the agency, and adds that anyone discovering a safety problem can inform the agency as well. It says nothing about what the agency does with either.

Where the duties actually are

The Foundation does not suggest from this that the Department may receive such reports and disregard them. The obligations exist; they are simply not in part 1002. They are in the statute, and this comment has set them out. A report under § 1002.20 is information received from industry within § 360ii(a)(3). Part II.E. It is material bearing on emissions of, and conditions of exposure to, electronic product radiation within § 360ii(a)(4). Part II.F. And to the extent it discloses a hazard, it bears on the development and administration of performance standards under § 360ii(a)(1). Part II.C.

The structure that results is worth stating precisely, because it explains something this comment returns to repeatedly. The regulation establishes a channel and prescribes nothing that must happen at the far end of it. The statutory duties that would give the channel its purpose are general, continuous and unscheduled. So a report may be properly made, properly received, and lawfully left where it lands, and no document will record that this has happened.

That is why Part VII.J declines to describe this as a surveillance system. A mechanism that accepts information is not a system for detecting anything unless somebody is required to look at what accumulates in it. The Foundation asks the Department to say whether anybody is, and by what instrument.

4. What the record shows was done

This subsection sets out what the record shows, which is less than the Foundation would wish and more than might be expected.

The agency's own form contemplates these products

The report is made on Form FDA 3649, Accidental Radiation Occurrence Report. The Foundation has examined the current form and records three things about it, because each answers an objection that might otherwise be made to this Part.

The form requires the submitter to identify the product by one of four radiation types, and the four are acoustic, ionizing, microwave and electromagnetic field, and optical. Optical radiation is a category on the agency's own accidental radiation occurrence form. The Foundation is therefore not asking the Department to extend a reporting scheme to a new kind of radiation. The scheme already names it.

The form accommodates a submitter who is not the manufacturer, directing such a person to enter their own address and to enter not applicable where the establishment identification is sought. A member of the public is contemplated by the instrument, consistently with the guidance quoted at subsection 3.

The form directs that it be sent by electronic mail to the customer service address of the Center for Devices and Radiological Health. That is the same address to which the Foundation transmitted its periodic compilations of the reports in Appendix A. Part IV.B.2. The Foundation did not choose that address because of this form, but the coincidence disposes of any suggestion that the material was sent to the wrong place.

What the Foundation submitted, and what followed

The Foundation's individual report concerning light-emitting diode lamps on an emergency vehicle, numbered COR22000194 on October 14, 2022, is described at subsection 2, together with the fact that no determination has been communicated. The periodic compilations of the reports in Appendix A were transmitted to the same address, and drew the form acknowledgment quoted at Part IV.B.3. The Foundation has not been told that any of this material was treated as a report of an accidental radiation occurrence, and has not been told that it was not.

What the Foundation cannot establish, and asks the Department to state

Three questions, each about the Department's own records.

How many reports under § 1002.20 has the Department received, from any manufacturer, concerning visible light emitted by light-emitting diode products, and in what years? Part II.L.3 asks the same question and the Foundation repeats it here because it is the single fact that would most change this Part. If the answer is none, that is a fact about compliance with an existing regulation by an industry that has placed billions of these products into commerce, and it is a fact the Department can establish without conducting any study.

How many reports has the Department received on Form FDA 3649 identifying the product type as optical, from any source, in any period? The category exists on the form. Whether it has ever been used for a visible-light product is not something the Foundation can discover.

Was any of the material the Foundation transmitted treated as a report under § 1002.20, and if so with what result? The Foundation does not assert that it should have been. Subsection 2 states that a report from a member of the public is not a report under that section and discharges no manufacturer's obligation.

One obstacle the Foundation states against itself

Section 1002.4 provides that the Secretary shall not disclose information reported to or otherwise obtained pursuant to part 1002. The Foundation raises that provision itself rather than waiting to be met with it. It may be an answer, in whole or in part, to the first two questions above, and it

may bear on the production of records sought under the Freedom of Information Act as described at Part IV.D.

The Foundation makes two points about it and no more. The provision is directed to information furnished by manufacturers, and its evident purpose concerns commercial confidentiality rather than the concealment of aggregate figures; a count of reports received, by year and by radiation type, discloses nothing about any manufacturer's processes. And a confidentiality provision cannot convert the absence of reports into a matter the Department is unable to discuss, because there is nothing confidential about the number zero. If the answer to the first question is none, § 1002.4 is not a reason to withhold it.

J. The Absence of Any Federal Surveillance System [RFI Q10]

1. Adverse event reporting [RFI Q10.f]

No federal system directed at optical radiation collects reports of adverse reaction to it. The Foundation states the position that carefully because the Center has said something adjacent to it, and the Foundation sets the Center's position out before its own.

In the letter of May 23, 2019 described at Part II.D.5, answering a request that a dedicated reporting system be established for radiofrequency exposure, the Center wrote: "A dedicated adverse reporting system is not required because CDRH already has a means for consumers to submit this type of report and those reports are received and reviewed." The letter gave the address of the agency's page for reporting a problem that appears to be related to exposure to electronic product radiation. That page is not confined to radiofrequency energy. On the Center's own account, therefore, a means exists by which a consumer may report an adverse reaction to any electronic product radiation, including optical radiation, and reports made through it are received and reviewed.

The Foundation accepts that account and asks the Department to apply it to this record. It used that route. Part IV.B sets out that between 2022 and 2026 the Foundation transmitted the reports now reproduced at Appendix A to the Center's radiological health customer service address, that the transmittals were acknowledged, and that 593 reports were in the Department's possession before this Request for Information issued. What the Foundation has not been able to identify is any consequence. No determination under § 360ll(e) has been communicated. No analysis has been published. The reports are not reflected in the Final Response of May 24, 2024, which was issued after most of them had been sent.

So the Foundation narrows its claim to what the record supports. It does not say that no channel exists; the Center says one does and the Foundation has used it. It says that a channel is not a surveillance system. A surveillance system has a case definition, a denominator, a published output and a feedback path to the program that is supposed to act on it, and none of those has been identified here. The Foundation asked the Department to establish one.

On March 3, 2023 the Foundation requested that the Centers for Disease Control and Prevention establish a webpage for the collection of reports of adverse reactions to visible radiation emitted by light-emitting diode products. The request was logged and assigned case identifier CDC-2806794-C4V4M6. No such collection mechanism has been established.

The Foundation draws attention to where that request was directed. The Centers for Disease Control and Prevention is a component of this Department. So is the National Institute for Occupational Safety and Health, as Part II.H.10 notes. The request did not ask the Department to persuade another agency, to negotiate with industry, or to resolve any scientific question. It asked one of the Department's own components to open a channel through which members of the public could report what they experienced. That is as small a step as can be proposed, and it was not taken.

The consequence bears directly on a proposition in the Final Response of May 24, 2024. That letter rests in part on the assertion that LED products have a long history of safety with respect to the visible wavelengths they emit. A history of safety, where it is not established by affirmative study, is an inference from the absence of reported harm. The inference is only as good as the reporting. Where no mechanism exists for the public to report, the absence of reports is a fact about the mechanism and not about the products. Part I.C.7 develops the point; this subsection supplies its factual basis, which is that the Department was asked to create the mechanism and did not.

The Foundation does not suggest that the Department is obliged to adopt every suggestion made to it. The point is narrower and is addressed to the evidentiary use the agency has made of silence. An agency that has not established surveillance, and that declined to establish it when asked, is not in a position to read its own empty files as a safety record.

Why a nonprofit organization is collecting these reports

The Foundation created its reporting form because nothing else existed. The form was not built to supplement a federal collection system or to reach people a federal system was missing. It was built in the absence of any such system, and it remains, so far as the Foundation can determine, the only place in the United States where a person who believes they have been harmed by light emitted by a light-emitting diode product can report that to anyone whose business it is to receive it.

The Foundation states the oddity of that position plainly. The usual case is of a private body gathering information a government does not want. This is the opposite. Section 360ii(a)(3) directs the Secretary to receive information from organizations on present and future potential electronic product radiation, and § 360ii(a)(4) directs the study and evaluation of conditions of exposure to it. A small nonprofit organization has been performing the collection function that those paragraphs presuppose, at its own expense, with no authority to require anything of anyone, and transmitting the results to the agency on which the duty falls.

Why the Foundation's data is worse than the Department's would be, and why that is the argument

The Department may reasonably say that the reports collected this way are self-selected, unverified, and not a sample of anything. That is correct, and Part VII.A.5 says so before the Department has to. The Foundation asks the Department to follow the criticism to its conclusion.

Every one of those weaknesses is a consequence of who is doing the collecting.

The form reaches only people who find it, which means people who already suspect that light is the cause of what they are experiencing and who then search for somewhere to say so. A federal reporting channel, published by the agency and linked from its pages, would reach people who have no idea that any such connection has been suggested.

The Foundation cannot verify a report. It has no authority to request a medical record, to contact a clinician, or to inspect an installation. The Department can do the first two by consent and the third through the agencies that administer the places concerned.

The Foundation cannot follow up systematically, cannot standardize the clinical description, and has no mechanism for distinguishing a report of discomfort from a report of a diagnosed condition except by what the reporter chose to write.

And the Foundation cannot establish a denominator. It does not know how many people were exposed under the conditions a reporter describes, which is the quantity that would turn a count of reports into a rate. Part II.D.6 describes the absence of the exposure baseline that would supply it.

The conclusion the Foundation draws is not that its data should be treated as better than it is. It is that the only body capable of producing data that does not have these defects is the Department.

Every methodological criticism available against the LED Incident Reports is a description of something a federal collection system would do and a nonprofit form cannot. The weakness of this evidence is therefore an argument for the system, not an argument against the concern.

The Foundation asked for that system. On March 3, 2023 it requested that the Centers for Disease Control and Prevention establish a webpage for collecting reports of adverse reaction to visible radiation emitted by LED products, and was assigned case identifier CDC-2806794-C4V4M6. None was established. The request was not for a rulemaking, a standard, a study or a finding. It was for a page on a website, within the Department, through which members of the public could report what they experienced.

The Foundation renews that request at Part IX.D, and adds this. It does not ask the Department to adopt its form, its categories, or its data. It asks the Department to establish its own. If the Department does so and receives nothing, that will be a finding worth having, and it will be the first finding on this subject that rests on a method anyone can describe. The Foundation would rather be answered by a federal reporting system that contradicts it than continue to be the only place these reports can go.

2. Disease and illness clusters [RFI Q10.g]

The notice asks about disease and illness clusters. The Foundation answers that it has none to report, states why it cannot have any, and then sets out the one geographic concentration in its record that nobody examined.

A cluster finding requires four things. A case definition, so that it is known what is being counted. A defined population at risk. An expected rate against which an observed number can be compared. And an investigation capable of distinguishing a real excess from the ordinary clumping of a common condition. Part VII.J.1 establishes that none of the first three exists for optical radiation: there is no case definition, there is no exposure denominator, and Part II.D.6 describes the absence of the exposure baseline that a denominator would require.

The Foundation therefore does not present the geographic distribution of its own reports as anything of the kind. Part VII.A.3 gives that distribution. It is a map of where people found a web form, not a map of where exposure occurred, and reading it as the second would be an error the Foundation declines to invite. The same applies to the condition categories at Part VII.A.4, which are self-identified.

The one concentration in the record, and what was done about it

Part IV.E.2 sets out a proceeding before the New York State Public Service Commission concerning street lighting in the Village of Cambridge, Washington County, in which fifty-two residents of the village appeared. The Foundation states what that is and what it is not. It is not a cluster investigation, no case definition was applied to it, no rate was computed, and the Foundation does not assert that the fifty-two share a condition or that any of them was injured. It is an administrative proceeding in which a number of people in one small place complained about one installation.

What the Foundation asks the Department to notice is narrower and does not depend on any of that. A geographic concentration of complaints about a single identified installation is the circumstance in which a surveillance system would look. No federal body looked, because no federal body collects, and the utility regulator that did take the matter up has no authority over an emission and no criterion to apply to one. The concentration is not evidence of a cluster. It is evidence that the capability to answer the question does not exist.

What exists in the published literature, and how it differs

One published finding in this record is epidemiological rather than anecdotal, and the Foundation distinguishes it carefully because the two are not the same kind of thing. Part II.E.6 sets out research published in a journal of this Department reporting an association between outdoor artificial light at night and pediatric papillary thyroid cancer, and records what Part II.E.6 also records: that the

International Agency for Research on Cancer has classified night shift work involving circadian disruption and has not classified outdoor artificial light at night, and that the two are not the same exposure. An association reported in a population study is not a cluster, is not a finding of causation, and the Foundation advances it as neither.

What the Foundation asks for under this head is at Part IX.D, and it is specific to this question. A reporting system that records only a symptom cannot support a cluster inquiry. One that records the location, the installation and the product class alongside the report can, and Part IX.D asks for the second.

3. Occupational and environmental monitoring [RFI Q10.b, Q10.c]

The notice asks about occupational and environmental monitoring. There is none of either for optical radiation from general lighting. The Foundation sets out each in turn, and in each case identifies the component of this Department that already holds the relevant capability.

Occupational

Part II.H.10 sets out the position of the agency that administers occupational safety and health, and the Foundation does not restate it. No general industry standard prescribes a maximum luminance, a spectral characteristic, a glare limit or a modulation limit for workplace lighting, so there is no quantity an employer is required to monitor and no exposure record anyone is required to keep. A workplace may be measured for illuminance to establish that there is enough light. Nothing requires it to be measured to establish that there is not too much.

The capability exists inside this Department. The National Institute for Occupational Safety and Health is a component of it, as Part VII.J.1 and Part II.H.10 both note, and it conducts workplace health hazard evaluations on request. The Foundation does not know whether any such evaluation has ever been requested or conducted concerning light-emitting diode lighting, and it says so rather than asserting a negative it cannot establish. It asks the Department to determine the answer, which is a question the Department can resolve from its own files without consulting anyone outside it, and to state the answer on this record.

What the record contains in the meantime is reported rather than monitored. Part VIII.B.6 records that thirty-two of the 593 accounts at Appendix A describe work or employment, including an employee who reports the onset of migraine with aura after a move to a building with ceiling diodes about seven feet above the desk. Part V.H treats occupational exposure. Those are reports, not measurements, and the distinction is the subject of this subsection.

Environmental

No federal program monitors ambient artificial light at night as an exposure. Part II.H.3 records that the Environmental Protection Agency stated it holds no statutory authority over visible light or non-ionizing radiation from electrical devices and has no experts in the subject, which disposes of the agency that would otherwise be the natural home for ambient monitoring.

Something close to monitoring does exist and the Foundation states it accurately, because the difference between what it measures and what would need to be measured is the point. Satellite radiometry operated by federal agencies records upward radiance from the night surface of the earth, and that data is federally produced, published and used in research, including research this comment cites at Part V. What it measures is the light that escapes upward. What a monitoring program for this subject would have to measure is the light that arrives at a person, at eye height, in the direction they are facing. Those are different quantities, and Part VIII.A sets out the same distinction in the form it takes for a public entity: the emission and the exposure are not the same measurand, and paragraph 360ii(a)(2) names them separately.

So the position is that the federal government measures what the installation sends into the sky and nothing measures what it sends into a bedroom. Part VI.D and Part VI.P treat the installations

concerned, and Part III.D.5 records that the maxima which exist for light trespass are municipal and state rather than federal.

The Foundation asks for both under this head at Part IX.D, and adds one request specific to this subsection, which is that the Department state what its own components have measured. The answer may be nothing. If it is, that answer is more useful on this record than the Foundation's inability to find anything.

K. Sensitive and Disproportionately Affected Populations [RFI Q11]

The Department asks which populations may be disproportionately affected. The Foundation answers from the reports, and then makes a submission about the structure of the question which it regards as more important than the answer.

What the reporters say about themselves

The self-identified condition categories are set out at Part VII.A.4 and the Foundation does not repeat the table. Four groups in it correspond to susceptibilities for which Part V identifies a described mechanism, and the Foundation notes the correspondence without asserting that the reports demonstrate it.

Conditions of the eye and of the ocular media, being astigmatism at 90 reports and, in the narratives, cataract, lens replacement or eye surgery at 12 and macular, retinal or glaucomatous conditions at 14. The mechanism is forward scatter of light within the eye, which increases the veiling luminance produced by a bright source and is treated at Part V.C.3.

Migraine, at 99 reports, with a described mechanism of photic trigger and interictal photophobia at Part V.E.

Photosensitive seizure disorders, with epilepsy selected by 10 reporters, and the regulatory treatment of modulated light discussed at Part VII.B.3 and Part VIII.D.4.

Autism and sensory processing differences, with autism selected by 54 reporters and terms for autism, Asperger syndrome, neurodivergence or sensory processing appearing in 18 narratives. Part VII.A.5 discloses that 31 of those 54 reports come from one area of California, which is the Foundation's own locality, and that figure should be read with that disclosure and not as a national distribution.

Photophobia was selected by 43 reporters. The Foundation records it separately because photophobia is a symptom rather than a diagnosis, so those reporters have identified an effect and not a condition, and the category cannot be used to describe a population.

Two further groups appear in the narratives in numbers too small to support any proposition, and the Foundation states them for completeness only: brain injury or concussion in 7 reports, and Sjogren syndrome or dry eye in 5. Ten reports mention a child of the reporter, in almost every case as a passenger in a vehicle the reporter was driving while affected, rather than as a person reporting an effect. Two mention military service. No report in the dataset is identifiably from a person under eighteen, and the Foundation draws attention to that absence rather than treating it as information: children do not complete reporting forms, so a dataset of this kind cannot speak to them at all.

The submission the Foundation regards as more important

The question as the Department has framed it invites an answer in terms of minorities with identifiable conditions. The Foundation asks the Department to notice two features of this record which cut against that framing, because they bear on what a performance standard would have to do.

The first is arithmetical. One hundred and twenty-eight of the 593 reporters, which is more than a fifth, selected None as their condition category. Fourteen reports go further and state affirmatively that the reporter has no relevant condition.

> "I have perfect vision, and every time a vehicle with LED headlights comes towards me, I am blinded, with a dramatic loss of night adapted vision. This is a huge safety hazard, as the dazzling light obscures the presence of hazards or pedestrians that are unfortunate enough to be caught behind it."
> — Appendix A, A.463 (Centennial, Colorado, January 8, 2026)

> "Can no longer drive at night due to extremely bright LED headlights blinding me. I have no health issues that would cause sensitivity to bright light"
> — Appendix A, A.173 (Hickory, North Carolina, November 24, 2024)

The Foundation cannot verify those statements and does not advance them as established. What it says is narrower. A substantial part of this record consists of people who describe themselves as ordinary, who identify no susceptibility, and who describe the emission as the variable that changed. A standard calibrated to protect only populations with identified conditions would not be addressed to them.

The second feature is the more significant and it concerns age. The susceptibility with the best established mechanism in this whole subject is the age-related increase in forward scatter within the eye, to which the development of cataract contributes markedly. Part V.C.5, which addresses age, astigmatism, cataract and intraocular lenses as modifiers, and Part V.C.3. That is not the condition of a minority. It is the condition of everybody who lives long enough, and the reports describe its onset in terms the Department can read for itself.

> "I have early cataracts. The LED headlights blind me, whereas halogen lights do not impair my vision at all. At a minimum adaptive driving beams should be required in the US like they have been used in Europe since 2012."
> — Appendix A, A.73 (Austin, Texas, August 3, 2024)

That reporter identifies the comparison that matters: the same eye, the same road, two light sources, and a difference in effect between them. The Foundation accordingly submits that the sensitive population for optical radiation from these products is not well described as a set of patient groups. It is better described as the general population, ordered by age, with particular conditions advancing an individual's position in that order. A standard built on that understanding is a standard for everybody, and Part IX.I asks for one.

What the Foundation does not claim

The Foundation does not assert that any reporter has the condition they selected, that any condition was caused by light emitted by light-emitting diode products, or that the proportions in Part VII.A.4 describe the proportions in any population. Part VII.A.5 states the limitations and every one of them applies here. In particular, a category selected by many reporters may reflect only that the Foundation's form reached people in that group, and the autism concentration disclosed at Part VII.A.5 is a demonstrated instance of exactly that effect.

The Foundation also declines to supply what it does not have. A proper answer to the Department's question would state, for each susceptible group, the exposure at which effects begin and how that exposure differs from the general population. The Foundation cannot supply a single such figure. Nobody can, from this dataset or from the published literature as it stands, and Part V.L sets out what would be needed. That is the answer to the Department's question about sensitive populations: the groups can be named, the mechanisms can be described, and the thresholds are unknown because the measurements have not been made. The Foundation asks the Department to make them. Part IX.C, and Part IX.L, which asks the Department to address sensitive populations expressly.

VIII. DISABILITY ACCESS AND THE ABSENCE OF A FEDERAL BASELINE

A. Why This Is Responsive to the RFI [RFI Q9, Q11]

Two questions of the notice make this Part responsive, and the Foundation identifies them rather than asserting relevance in general terms. Question 9 concerns the information that should be disclosed to state and local governments. Question 11 concerns populations that may be disproportionately affected. This Part answers both, and it answers them with the same fact: an apparatus of federal and state disability law is already operating, it imposes obligations on many thousands of entities, and at the point where each of those obligations has to be discharged it requires an input that no federal body has supplied.

a. The apparatus, which exists and is already operating

Title I of the Americans with Disabilities Act reaches employers, and the workplace is a place of exposure a person cannot leave for the duration of their shift; Part VIII.B.6 treats it. Title II reaches public entities. Title III reaches places of public accommodation. Section 504 of the Rehabilitation Act reaches recipients of federal financial assistance and the programs of federal agencies, including this Department's own. Part VIII.B sets out the framework and the decisions relied on.

Within it, three mechanisms bear on an emitting product. The self-evaluation duty at 28 C.F.R. § 35.105 requires a public entity to evaluate its own services, policies and practices and to remedy what does not comply; Part VIII.C describes what performing it for a light-emitting product would require. The individualized, fact-specific inquiry that a request for accommodation triggers is distinct from that systemic duty, and Part VIII.F describes it. And the communication-specific duties at 28 C.F.R. §§ 35.160 to 35.164 require that a communication be as effective for a person with a disability as it is for anyone else, which reaches an emitting product whenever the product is the medium of the communication; Part VIII.B.5 sets out those provisions and the precise relationship between them and the visible notification appliance, which is the one place in the framework where an optical quantity is already specified: Part VIII.D.4.

Three federal bodies write or administer those rules. The United States Access Board issues the accessibility guidelines. The Department of Justice issues the Title II and Title III regulations and adopts the standards under them. The Equal Employment Opportunity Commission administers Title I, and Part VIII.B.6 records that the Foundation wrote to its Chair on February 26, 2023. All three are among the federal agencies collected at Part II.H: the Access Board at Part II.H.11, the Department of Justice at Part II.H.18, and the Commission at Part II.H.19. The Foundation draws attention to the last two because the reason for their inclusion is the subject of this Part. The Department of Justice writes the rules that determine when an emission becomes a barrier to the services of a public entity, and the Commission administers the provision that reaches the same emission in the workplace. Neither tests an electronic product, and Part II.H.18 sets out the Foundation's position on how the liaison paragraph reaches them. Part II.H.11 treats the Access Board, which has already said the subject is not within its authority and offered technical assistance to this agency on request.

State civil rights agencies and statutes operate in parallel, and they have already acted. Part IV.E sets out the proceedings. This Department also sits inside the apparatus rather than outside it: Part VIII.B.3 records that it is a designated agency under Title II for a class of public entities, and section 504 reaches its own programs.

b. What every part of that apparatus needs, and nobody supplies

At the point where any of those mechanisms has to decide whether a particular light is a barrier, each needs the same two things: a statement of what the product emits, and a referent against which to judge it. Neither exists. Part VIII.D establishes the absence. There is no performance standard for

the visible light emitted by light-emitting diode products, and no federal exposure guidance for optical radiation from general lighting.

The consequence is not that the duty is suspended, and Part VIII.D.3 states it exactly: the duty is owed, and the technical basis for performing it is missing. Each entity must therefore answer a question of photobiology for itself, or decline to answer it. Part VIII.E sets out what follows from that, and Part VIII.E.6 sets out what happened when a federal office was asked.

This is the respect in which the whole apparatus depends on this Department, and the dependence is a matter of statutory assignment rather than of convenience. The duty to study and evaluate the emissions and the conditions of exposure is at § 360ii(a)(4). The duty to minimize them is at (a)(2). The authority to prescribe a standard is at § 360kk. Part I.A establishes that no other federal agency holds any of them, and that the nine agencies asked have each said so.

c. The record already contains findings, an open docket and accommodations

The Foundation sets these out because they establish that the question is not prospective. It is being decided now, by bodies that have no federal criterion to decide it against.

A state enforcement agency has made a finding. Part IV.E.1 sets out the determination of the Minnesota Department of Human Rights of June 15, 2023 in file REF: 74059, in which the agency found probable cause that a respondent discriminated against a charging party whose disability-related symptoms were attributed to lighting. The Foundation states what that is and is not, as Part IV.E.1 does: a probable cause determination under the Minnesota Human Rights Act is a threshold finding that a charge warrants proceeding, and it is not an adjudication of liability.

A state utility regulator has an open docket. Part IV.E.2 sets out Case 23-E-0727 before the New York State Public Service Commission, in which fifty-two residents and customers of the Village of Cambridge, Washington County, New York complained on December 13, 2021 of the conversion of the village's streetlights to light-emitting diodes. The Foundation describes it as what it is, a complaint proceeding, and does not characterize its outcome.

The Foundation records one instance in which an accommodation was sought and granted, and it is the only such instance it has. On April 3, 2026 the city of Ketchikan, Alaska placed three low-pressure sodium streetlights in service in substitution for blue-rich light-emitting diode streetlights. The Foundation's account, which is set out at Part III.G.3 with its basis and its limits, is that a resident living above the street requested an accommodation under the Americans with Disabilities Act, on the basis that the blue-rich installation was producing adverse reactions in them, and that the city provided the accommodation requested by substituting the amber source. The characterization of the installation as a pilot is the supplier's and not the city's, which Part III.G.3 sets out. The Foundation does not identify the requester.

Three features of that instance bear on this Part, and the Foundation states the third against itself. The first is that the mechanism worked: a request under the framework at Part VIII.B produced a change in an emission, which establishes that the framework is capable of reaching this subject matter. The second is what it took. Appendix A contains two reports from that municipality, at A.158 and A.477, the earlier describing the conversion of the city's streetlights in February 2021 to unshielded sources of four to five thousand kelvin, and the substitution was placed in service in April 2026. The third is that the city had no federal criterion to apply at any point in that sequence, and neither did the requester. What was available to be weighed was one person's account of their own experience against an installation nobody had measured. The outcome in that municipality turned on the judgment of that municipality, which is the condition Part VIII.E describes and the reason this comment is addressed to this Department rather than to any city.

And individual proceedings are being brought. Part IV.D and Part IV.E describe actions brought by Mark Baker in his individual capacity against municipalities, which Part IV.A.2 identifies as his rather than the Foundation's. The point about them that bears on this Department is not their

merits, on which this comment takes no position. It is that each is an attempt to obtain from a municipality a determination that a municipality is not equipped to make.

d. The populations, and the care the Foundation takes with the list

Part V.E sets out the evidence for the responses that bear on this: photosensitive epilepsy and flash-rate thresholds, migraine and photophobia, autism and sensory processing differences, and the trigeminal and autonomic pathways. Part VII.A.4 records the self-identified condition categories of the 593 reporters at Appendix A, and Part VII.K treats sensitive and disproportionately affected populations. Part IX.L states the request the Foundation makes about them.

The Foundation is careful with this list and says why. The categories at Part VII.A.4 are self-identified and are not diagnoses; Part VII.A.5 states the limit of what the database establishes. Several conditions appear in the reports and nowhere in the literature the comment relies on. One category reported to the Foundation, a self-identified sensitivity to electromagnetic fields, is treated at Part VII and the Foundation does not include it among the conditions for which the literature establishes a light-mediated mechanism. It says so expressly, because a list that mixed established and unestablished conditions would be discounted as a whole, and the established ones are enough.

What the Foundation asks about these populations is accordingly a question of study design rather than a claim about any individual: that the research directed by § 360ii(a)(2) and the evaluation directed by (a)(4) include them rather than control for them, which is the request at Part IX.C.6, and that any criterion state the population whose response it is calibrated to, which is the request at Part III.F.

e. Why this is brought to this Department and not to the entities being asked

Because the apparatus cannot generate the input it requires. A municipality asked whether its streetlight is a barrier must answer a question of photobiology. A state civil rights agency investigating a charge must answer the same question. A federal civil rights office receiving a complaint must answer it, and Part VIII.E.6 records what one did when it was asked.

The Foundation states the limitation precisely, because the broad version of it is wrong and would be refuted at once. It is not that these bodies lack authority over emissions. States and municipalities have that authority and exercise it. A state vehicle code prescribes what a lamp fitted to a vehicle may do. Municipal instruments limit what an outdoor installation may emit and in which directions, and Part III.D.5 records that the maxima which exist for light trespass are municipal and state rather than federal. Nothing prevents a city or a state from measuring what its own installations emit, and some have done so.

What none of them can supply is an exposure criterion, and that is a different thing from an emission limit. The two are distinct quantities and paragraph 360ii(a)(2) names them separately: the emissions of, and the exposure of people to, unnecessary electronic product radiation. A municipality can resolve that its luminaires will emit nothing above the horizontal, and that resolution is complete and enforceable without any federal input. It cannot resolve at what retinal irradiance, at what modulation depth, or at what spectral composition a person is harmed, because that is a question about human physiology rather than about municipal policy. Part VIII.D establishes that no federal exposure guidance for optical radiation from general lighting exists for it to adopt, and Part III sets out the sixteen characteristics in which such a criterion would have to be expressed.

That is the division this comment turns on and the Foundation states it in one line. The entities within the apparatus can regulate what a product emits. They cannot determine what a person may safely receive. The second is the question Congress assigned to this Department at § 360ii(a)(4) and (a)(2), and Part I.A establishes that it assigned it nowhere else.

So the Foundation's answer to Question 9 is that the disclosure the question asks about is precisely the missing input, and Part VIII.G and Part IX.F set out what disclosure would have to contain. Its

answer to Question 11 is that the populations the question asks about are the ones on whom the absence of a criterion falls, because a framework that cannot identify a barrier systemically leaves each affected person to establish it individually, which is the movement Part VIII.E and Part VIII.F describe. Both answers rest on one fact, and the fact is in this Department's keeping.

B. The Federal Disability Framework

This subsection sets out the federal provisions the remainder of this Part relies on. The Foundation sets them out because a comment addressed to this Department about an emitting product has to establish that the duties exist before it can establish what the absence of a federal criterion does to them, and because two of the provisions reach this Department directly rather than by analogy.

The provisions divide into six. Two are systemic: the self-evaluation duty that reaches public entities, at subsection 1, and section 504 of the Rehabilitation Act, which reaches recipients of federal financial assistance and the programs of federal agencies, at subsection 2. One reaches this Department in a particular capacity, as the agency designated to receive and investigate complaints against a class of public entities, at subsection 3. One is individualized and arises on a person's request rather than on the entity's own initiative, at subsection 4. One governs the effectiveness of a communication, at subsection 5. And one reaches the workplace, at subsection 6. Subsection 7 sets out the decisions relied on and states what the Foundation does not take from them.

The Foundation states the limitation of all of them at the outset. None of these provisions names light. None fixes a quantity an emitting product may produce, with the single exception at Part VIII.D.4, which fixes a floor rather than a ceiling. They are provisions about access, and about the effectiveness of a service or a communication, and they operate on whatever the barrier turns out to be. The Foundation does not represent that any of them has been held to reach an optical emission. What this Part draws from them is narrower: each requires somebody to answer a question about an emission, and Part VIII.D establishes that no federal answer exists for any of them to use.

1. ADA Title II and the self-evaluation duty — 28 C.F.R. § 35.105

The regulation is the Department of Justice's, issued under Title II of the Americans with Disabilities Act and codified at 28 C.F.R. part 35. Section 35.105 is short. The Foundation paraphrases it in the three paragraphs that follow rather than quoting it, and says that it is paraphrasing, because the text has not been verified against the current Code in the preparation of this comment.

The evaluation itself

A public entity is required to evaluate its current services, policies and practices, and the effects of them, which do not or may not meet the requirements of the regulation, and then to make whatever modifications that evaluation shows to be required. The duty attached within one year of the date the regulation took effect, which was in the early 1990s.

Participation by interested persons

The entity is required to give interested persons, including individuals with disabilities and organizations representing them, an opportunity to participate in the evaluation by submitting comments. The Foundation is an organization of that kind and notes the provision for a reason that bears on this comment rather than on its own standing: participation of that kind is worth something only if the participant can say what to measure. Part VIII.C.2 establishes that at present nobody can, which is a limitation on the Foundation as much as on anyone else.

The record

An entity employing fifty or more persons is required to keep, for at least three years after the evaluation is complete, a list of the interested persons consulted, a description of the areas examined and the problems identified, and a description of the modifications made, and to make

those available for public inspection. The consequence is that the adequacy of a self-evaluation is a matter of record rather than of assertion, at least for entities above that threshold.

Why the date matters here

The date matters in this subject more than it usually does. The duty attached, and the first evaluations were performed, before the products this comment concerns were installed anywhere. Part IV.G sets out the federally driven transition to light-emitting diodes, and Part IV.G.5 establishes that no biological or health evaluation accompanied it. A public entity that completed its self-evaluation in the early 1990s evaluated a program lit by a technology it has since replaced.

The Foundation states carefully what follows from that, because more does not follow than it is asserting. It does not assert that a lighting conversion triggers a fresh self-evaluation as a matter of law, and it is aware of no decision so holding. It relies on a narrower proposition, which subsection 7 attributes to the decision it comes from: whether a completed self-evaluation covered all of an entity's current services is a question of fact. An entity whose evaluation predates its present installation has not, on that proposition, established that the evaluation reached it. Part II.I.6 makes the comparable observation about this Department's own duty under 21 U.S.C. § 360jj, where the statutory structure is continuing for the same reason.

The reason this belongs in a comment to this Department rather than to the author of the regulation is at Part VIII.H, and the Foundation restates it in one line. It asks nothing of the regulation and nothing of the agency that issued it. It asks this Department to supply the technical referent that performing the regulation requires, which is a thing only this Department can supply, and Part VIII.C sets out step by step what performing it would require for a product that emits optical radiation.

2. Section 504 of the Rehabilitation Act and the Department's own implementing regulations

Section 504 of the Rehabilitation Act of 1973 is at 29 U.S.C. § 794. It reaches two classes of program, and the second is what makes this Department a subject of the provision rather than an observer of it. The first is a program or activity receiving federal financial assistance. The second is a program or activity conducted by an Executive agency, which includes this Department's own.

The Department has issued regulations under the provision. Those applying to recipients of its financial assistance are at 45 C.F.R. part 84, and those applying to the programs the Department itself conducts are at 45 C.F.R. part 85. The Foundation states those part numbers as its understanding and has not verified them against the current Code, and it asserts nothing about their contents beyond their subject matter.

The first branch: the recipients

The recipients of this Department's financial assistance include hospitals, clinics, community health centers, and state agencies administering health and social service programs. Each operates facilities, and the facilities are lit. Part VI.E addresses interior lighting in healthcare settings, and the accounts at Appendix A include reports from medical settings. The provision reaches those recipients, and what it requires of them as to an emission runs into the same absence Part VIII.D describes. A recipient asked to modify the lighting in a facility where a federally assisted program is delivered is in the position Part VIII.C describes, with no federal characterization of the emission to work from.

The second branch: the Department's own programs

The second branch reaches the Department directly. Whatever the Department conducts itself, it conducts subject to the provision. Part III.F draws the consequence for the content of a performance standard rather than for the Department's conduct: a criterion written to the comfort of an unimpaired observer, adopted by a Department that carries this duty, would exclude by construction the people the duty exists to reach. The Foundation does not develop that into an allegation. It states it as a reason the Department should characterize the emission with the exposed

person in view, which is what Part III.F sets out as a characteristic and what Part IX.L asks as a recommendation.

What the record contains under the provision

One complaint under the provision is in this record, and the Foundation records its outcome rather than its merits. Part VIII.E.6 and Part II.H.6 set out the sequence. A complaint under Title II and section 504 concerning rectangular rapid-flashing beacons was submitted by Mr. Baker individually. The Department of Justice transferred it to the Department of Transportation. On October 19, 2022 the Office of Civil Rights of the Federal Highway Administration dismissed it without investigation, and Part II.H.18 sets out the regulatory ground on which that dismissal rested. The Foundation draws one thing from it: a complaint under the provision reached a federal agency and produced no inquiry into the emission.

The Foundation makes no allegation against this Department under the provision. It has filed no complaint under it against the Department, none is pending, and nothing in this Part should be read as one. The provision is set out because the Department's duties under it and under 21 U.S.C. § 360ii meet in the same buildings, and because a Department subject to it has a reason beyond § 360ii to know what the lighting in those buildings emits.

3. The Department as a designated agency under Title II

The Department is a designated agency under Title II. The designation is made by the regulation at 28 C.F.R. § 35.190, which allocates among federal agencies the function of receiving and investigating complaints against public entities and of providing technical assistance. The class allocated to this Department is programs, services and regulatory activities relating to the provision of health care and social services.

The consequence is that the Department is not a bystander to the problem the rest of this Part describes. In the capacity the designation gives it, the Department would receive a complaint that a public entity delivering health care or social services had failed to evaluate its services as 28 C.F.R. § 35.105 requires, or had denied a requested modification. It would then have to investigate that complaint. Part VIII.C establishes that the evaluation cannot be completed as to an emitting product, because no federal characterization of the emission exists, and Part VIII.D establishes that none exists for the Department to apply in the investigation either.

That places the Department in an unusual position, and the Foundation states it plainly because it is the most direct thing this Part has to say to this Department. In one capacity the Department holds the function of investigating whether a covered entity has evaluated what its lighting does to the people its programs serve. In another it holds the only congressional authority to establish what that lighting may do, which Part I.A establishes was assigned nowhere else. The first function cannot be discharged on a record the second has never created. No other federal agency holds both.

The Foundation confines itself to the structural point. It does not assert that the Department has received a complaint of this kind, or that any has been filed with it. It observes only that the two capacities sit in different components of the same Department, the designated-agency function with the component that administers civil rights and § 360ii with the Center for Devices and Radiological Health. Part IX.E.5 asks the Department to send express written invitations to consult to other federal agencies. The Foundation observes that the first such relationship available to the Department is an internal one, and that it requires no invitation from anybody.

4. The individualized inquiry duty, distinct from the systemic duty

The duties at subsections 1 to 3 operate on a program. This one operates on a person. The Foundation separates them because they fail differently when no federal criterion exists, and because the failure of the first is what loads the second.

The individualized duty arises from the requirement that a public entity make reasonable modifications to its policies, practices and procedures when necessary to avoid discrimination on

the basis of disability, at 28 C.F.R. § 35.130(b)(7), and from the communication duties at subsection 5. Its content comes from the decisions, which subsection 7 sets out and which the Foundation does not restate here. The propositions relied on are two: that once an entity is on notice of a request it must undertake a fact-specific investigation and gather sufficient information to determine what accommodation is necessary, and that whether a modification would fundamentally alter what the entity offers is answered by an inquiry into the particular person and the particular modification rather than by a general rule.

The two duties differ in four respects, and the Foundation sets them out because the fourth is the one this comment turns on. The comparison is the Foundation's own and is not drawn from any decision.

The trigger differs. The systemic duty arises on the entity's own initiative and on a date fixed by the regulation. The individualized duty arises when a person makes a request, and it arises then whether or not the entity ever performed the systemic duty at all.

The object differs. The systemic duty is owed as to the program. The individualized duty is owed as to one person, one barrier and one proposed modification.

The record differs, and this is where the absence of a criterion does its work. The systemic duty is performed on whatever the entity can learn about its own services, and Part VIII.C.2 establishes that as to an emission it can learn nothing it can state as a number. The individualized duty is performed on the record one requester can assemble, which in practice is an account of that person's own experience, because Part VIII.F.2 establishes that there is no threshold against which a measurement they commissioned would mean anything.

The consequence differs, and the difference is not symmetrical. A systemic duty that cannot be performed produces no visible failure: nothing happens, no document is generated, and nobody is told. An individualized duty that cannot be performed produces a decision, and the decision falls on the requester, because the requester carries the work of establishing a harm the federal government has never characterized. Part VIII.E.5 states that consequence in general terms as the systemic duty defaulting into the individualized one, and Part VIII.F describes what it looks like when it happens to somebody.

The Foundation asks nothing of this duty, and says so because the opposite request would be the natural one to suspect. It does not ask that the individualized inquiry be relaxed, and it does not ask that a request be granted without one. The fact-specific inquiry is the right method, and an entity that conducts it properly is doing what the provision requires of it. What the Foundation asks is that the inquiry be given something to work with. An entity conducting it needs to know what the product emits and at what level a person is affected, and Part VIII.G.4 sets out what a federal performance standard would supply to it.

5. Communication-specific duties — 28 C.F.R. §§ 35.160 to 35.164

These provisions are about the effectiveness of a communication rather than about the accessibility of a place, and that is why they appear in a comment about an emitting product. The medium of a communication from a public entity is now frequently an emitting product.

The Foundation summarizes the five sections and again states that it is summarizing. Section 35.160 is the general provision: an entity must take appropriate steps to ensure that its communications with applicants, participants, members of the public and companions with disabilities are as effective as its communications with others, and must furnish appropriate auxiliary aids and services, giving primary consideration to the aid or service the person requests. Section 35.161 concerns telecommunications. Section 35.162 concerns telephone emergency services, which must provide direct access. Section 35.163 concerns information and signage, and requires an entity to ensure that interested persons can obtain information as to the existence and location of its accessible services, activities and facilities. Section 35.164 states the limitation, and subsection below treats it separately.

A correction the Foundation makes to its own formulation

Part VIII.A says that these provisions reach the visible notification appliance. Stated that way it is too loose, and the Foundation states the relationship precisely here rather than leaving the looser version to be answered. The optical numbers that exist for a visible alarm are in the accessibility guidelines and standards, which govern new construction and alterations and are adopted under a different provision of the same part. Part VIII.D.4 sets out those numbers and their source. Sections 35.160 to 35.164 fix no optical quantity at all. What they fix is an outcome: the communication must be as effective for a person with a disability as it is for everybody else.

An outcome duty of that kind reaches the medium whenever the medium determines the outcome, and that is the connection this subsection relies on. An emergency alarm conveys a message to a person who could not otherwise receive it. A dynamic message sign conveys a traffic instruction, and Part VI.J addresses that class. A queue display, a wayfinding display or a self-service terminal conveys the information a person needs in order to use the service at all, and Part VI.S addresses the decorative lighting applied to equipment of that kind. In each the message arrives as light, and an emission a person cannot look at does not convey a message to that person effectively.

The duty cuts both ways, and the Foundation says which way it is asking

The same appliance that makes an alarm effective for a person who cannot hear it may be the emission that affects a person with photosensitive epilepsy, and the accounts at Appendix A include reports of that kind. Part VIII.D.4 sets out the asymmetry in what the framework specifies: the flash rate of a visible alarm is capped, its intensity is bounded below and not above, and no maximum luminance appears anywhere in the provision. The Foundation asks for no reduction in how effectively a person who cannot hear is warned. It asks that the quantity which is presently unbounded be bounded, which is a request about the ceiling and not about the floor, and Part VIII.H records the limits of what this Part requests.

The limitation at § 35.164, and why it matters here

An entity declining to furnish an auxiliary aid or service on the ground that it would result in a fundamental alteration or in undue financial and administrative burdens must make that determination at the level of the head of the entity or a designee, in writing, with the reasons stated. A determination in that form is written to be reviewable, and that is the point of requiring it. But an entity cannot state in writing why a less harmful alternative would be an undue burden without knowing what the alternative would have to achieve, and Part VIII.D establishes that no federal statement of what it would have to achieve exists. The safeguard is drafted to be tested. In this subject matter there is nothing to test it against.

The Foundation asks nothing of these provisions either. It identifies them because each makes somebody responsible for an outcome that an optical emission can defeat, and because the responsibility is allocated while the technical criterion is not. Part VIII.G.1 sets out the common referent a federal standard would supply, and Part IX.I sets out the instrument the Foundation asks this Department to issue.

6. ADA Title I, and the workplace as a place of exposure

The two preceding subsections concern what a public entity owes the public. Title I concerns what an employer owes an employee, and the Foundation brings it into this comment for one reason: a substantial number of the accounts at Appendix A describe the place where the reporter works.

The framework is 42 U.S.C. §§ 12111 and following, with the Commission's regulations at 29 C.F.R. part 1630. The duty is to provide reasonable accommodation to a qualified individual unless doing so would impose an undue hardship, and the inquiry it requires is individualized, as it is under Title II.

What the record contains. Of the 593 reports at Appendix A, thirty-two describe work or employment. They include an employee of a defense manufacturer who reports the onset of

migraine with aura after a move to a building with ceiling diodes about seven feet above the desk, and who states that the condition has greatly impeded the work; an office worker who keeps the overhead light off and works by a table lamp, and who wore sunglasses through a meeting in a lit conference room; a worker who reports exposure to high-powered diode arrays and that nobody at the workplace seems concerned; a reporter who describes being made fun of for trying to protect themselves; and several who report that the condition has cost them work, hours or income. Two report that they left employment. The Foundation does not assert that any of these is a Title I violation. None has been adjudicated and the Foundation has investigated none of them. What the record establishes is that the exposure is reported in the workplace and that the reporters describe it as affecting their capacity to work.

The Foundation raised this with the agency that administers Title I. On February 26, 2023 it wrote to the Chair of the Equal Employment Opportunity Commission. Appendix E.20. The letter stated no request for action, which the Foundation records as a limitation of its own document rather than of the Commission's response, and no response is recorded.

Why this bears on the Department's duty rather than the Commission's. An employer deciding whether to accommodate an employee who reports that the lighting in a building is disabling faces the same difficulty as the public entity described at subsection D: there is no federal criterion for what the lighting emits, and therefore no referent against which the request can be evaluated. The employer is left to decide a technical question that no federal agency has answered. The Foundation does not ask this Department to administer Title I. It asks the Department to notice that the absence of a standard under § 360kk is felt in the employment relation as well as in the public way.

7. The decisions that establish the duties relied on here

The Foundation sets out four decisions, states what each is relied on for, and states what it does not take from any of them.

Barden v. City of Sacramento (9th Cir. 2002). Relied on for the breadth of what Title II reaches: the public sidewalk is a service, program or activity of the public entity, so the obligation is not confined to buildings. The relevance here is that the lighting a public entity installs in the public way is within what Title II reaches, which is the premise of subsection C.

Tyler v. City of Manhattan, 849 F. Supp. 1429 (D. Kan. 1994). Relied on for the proposition that whether a self-evaluation covered all of an entity's current services is a question of fact. The relevance is that an entity which performed a self-evaluation years ago, before it installed the products described at Part VI, has not necessarily discharged the duty as to those products.

Duvall v. County of Kitsap, 260 F.3d 1124 (9th Cir. 2001). Relied on for the individualized duty described at subsection 4: once an entity is on notice of a request, it must undertake a fact-specific investigation and gather sufficient information to determine what accommodation is necessary. The relevance is that this duty is owed whether or not a federal emission criterion exists, and subsection E.5 sets out what happens to it when none does.

PGA Tour, Inc. v. Martin, 532 U.S. 661 (2001). Relied on for the parallel proposition under Title III, and for the method rather than the holding: the question whether a modification would fundamentally alter what the entity offers is answered by an individualized inquiry into the particular person and the particular modification, not by a categorical rule. The relevance is that a private entity operating the lighting described at Part VI.F and Part VI.G faces an inquiry of the same shape, and faces it without a federal referent for what the lighting emits.

What the Foundation does not take from these. None of the four concerns light. None holds that an optical emission is a barrier within the meaning of either title, and the Foundation does not represent that any court has so held. They are cited for the duties they establish and for the

method those duties require, and the question whether a particular emission is a barrier in a particular case is the question the absence of a federal criterion makes unanswerable. That is the point of this Part.

C. What a Self-Evaluation of an Emitting Product Would Require

Section 35.105 requires a public entity to evaluate its current services, policies and practices, and to modify any that do not comply with the regulation. This subsection sets out what performing that evaluation would require for a product that emits optical radiation. The Foundation sets it out in the four steps the regulation implies, because the steps are where the difficulty stops being abstract: the first is performable, the second is not, and the third and fourth depend on the second.

1. Identifying the emitting products a public entity operates

A municipality operates street lighting, park and parking area lighting, interior and exterior lighting of its own buildings, traffic signals and pedestrian beacons, emergency vehicle lamps, transit lighting, and signage and dynamic message displays. Part VI describes each class and what is known about what it emits.

This step is performable and the Foundation does not suggest otherwise. It is an inventory, the entity holds the records, and nothing in it requires any technical judgment.

One thing the entity will find is worth recording, because it bears on every step after this one. Most of these installations were converted to light-emitting diodes within the last fifteen years under the federal energy framework Part IV.G describes, and Part IV.G.5 records that no biological or health evaluation accompanied the transition. The entity is therefore evaluating an installed base it did not choose on optical grounds and about which it holds no optical information.

2. Characterizing what each product emits

This is the step at which the duty stops being performable, and the Foundation states why in three parts.

First, the quantities. Part III identifies sixteen characteristics in which an emission would have to be described. The ones that bear on whether a light is a barrier are the spectral power distribution, the luminance of the emitting surface and the angle it subtends, and the temporal quantities at Part III.E. Correlated color temperature and lumens, which are the figures a procurement document ordinarily carries, do not describe any of them; Part V.B.3 and the front matter, subsection G, establish that.

Second, the information is not disclosed. Part VI.G.2 records the position for one class, in which the governing characteristic exists on the component manufacturer's data sheet, is known to the product maker, and reaches nobody who meets the product. Part IX.F asks this Department to require disclosure for that reason.

Third, the entity cannot generate the information itself. Part V.J.1 sets out the instruments and measurands available, and a spectroradiometer, or a photodiode of adequate bandwidth with an oscilloscope, is not ordinary municipal equipment. Part V.J.2 establishes that the measurement conditions determine the result, so even an entity that acquired an instrument would need a specified method, and none exists for this purpose.

An entity performing this step honestly must therefore commission a measurement it has no criterion to interpret, or rely on what the manufacturer states. Part VIII.E records which of those happens.

3. Identifying the populations affected

The entity must identify the people its services reach who are affected by the emission. This step is partly performable. An entity can know, without any photobiology, that among those it serves are

people with photosensitive epilepsy, with migraine and photophobia, with traumatic brain injury, and with autism and other sensory processing differences. Part V.E sets out the evidence for each response and Part VII.K treats the populations.

What the entity cannot do is connect a population to an exposure level, because no exposure level has been established for any of them. The step therefore produces a list of affected groups and no criterion to apply to it, which is a different and worse position than having neither. An entity that knows who is affected and cannot say at what level is on notice of a problem it has no means to size.

The Foundation repeats here the limit it states at Part VIII.A and Part VII.A.5. The condition categories recorded at Part VII.A.4 are self-identified and are not diagnoses, and the Foundation does not advance a list of conditions as established. The request at Part IX.C.6 is that the research include these populations.

4. Evaluating alternatives and their emission characteristics

The final step requires the entity to compare what is installed against what could be installed. Part III.G sets out the techniques available: shielding and diffusion, user control where the product has an indicator, and substitution of the source technology.

The alternatives exist and are procurable, and Part III.G.3 records one instance in which a municipality substituted a different source technology, together with the substantial limits of what that instance establishes.

But the comparison requires the characterization the second step could not produce, and now for two products rather than one. And the effectiveness of each technique is the subject of a federal duty that has not been performed: paragraph 360ii(a)(5) directs the Secretary to develop, test and evaluate the effectiveness of procedures and techniques for minimizing exposure, and Part II.G.3 records that the techniques exist while the federal evaluation of them does not.

The conclusion of the four steps is the one Part VIII.D.3 states in a sentence: the duty is owed, and the technical basis for performing it is missing. The Foundation emphasizes that the entity is not thereby excused. The regulation requires the evaluation, the entity must act on something, and what it acts on in practice is industry and trade guidance, which Part VIII.E describes, or nothing at all.

D. The Missing Federal Baseline

This subsection establishes the two absences the rest of this Part depends on, in the order in which they bear on a public entity: no performance standard governs what an LED product may emit, at subsection 1, and no federal exposure guidance states what a person may receive from general lighting, at subsection 2. Subsection 3 states what those absences do and do not do to the duty, and states it precisely, because the imprecise version of it would be useful to the wrong people. Subsection 4 then sets out the one place in the accessibility framework where an optical quantity is fixed, which matters because it shows that specifying such a quantity is a thing the federal government knows how to do.

The Foundation states each absence as an absence it has looked for and not found, rather than as one it asserts to exist, and in each case it identifies what does exist and might be mistaken for the missing thing. Each of the four items it names in subsection 1 has at some point been offered to the Foundation as the answer to this question. None of them is. Everything in the two subsections can be checked by the Department in its own records.

1. No performance standard exists for visible light emitted by LED products

No performance standard prescribed under 21 U.S.C. § 360kk governs the visible light emitted by any light-emitting diode product. Part I.B.2 states that in summary and Part II.C establishes it against the record, and the Foundation does not restate the record here. What this subsection adds

is what the absence means to a public entity holding a duty it cannot discharge, and what exists in place of the standard.

The absence is not for want of authority or of precedent. The subchapter contains a part titled Performance Standards for Light-Emitting Products, and Part II.A.2 enumerates the four standards in it: laser products, specific purpose laser products, sunlamp products and ultraviolet lamps intended for use in sunlamp products, and high-intensity mercury vapor discharge lamps. The fourth is a general-illumination lamp. Part I.E and Part I.G set out what that standard regulates and why it matters here: it addresses the shortwave ultraviolet released when the lamp's outer envelope breaks, and it requires the lamp to extinguish itself. So the Department has already prescribed a performance standard for a lamp sold for general illumination, under this authority, and the quantity it chose to regulate was not the visible light.

Four things that exist and are not the missing standard

The Foundation names them because each has at some point been treated as an answer to the question this Part asks, and because a public entity reading any of them could reasonably believe the subject had been addressed.

The general radiological health requirements. The product classifications for LED products record that the requirements at parts 1000 to 1005 apply to them. Part II.B.6 sets out what those requirements are and are not: they are administrative, reporting and recordkeeping provisions. They prescribe no emission limit for anything.

The product code. Part II.B.6 also states the limit of the point the Foundation draws from the classification itself. A product code is an administrative classification rather than a rule. It binds nobody and determines nothing about what the product may emit.

A premarket clearance. Part II.C.4 works through an instance. A notification under section 510(k) of the Act is a determination of substantial equivalence to a predicate device. It is a comparison between two products, not a determination about an emission, and a clearance therefore establishes no ceiling.

The federal lamp efficiency framework. Part IV.G.4 establishes that the efficacy requirements administered by another Department are expressed in lumens per watt and are silent as to what the selected technology emits. An entity procuring to that framework is procuring to a measure of efficiency, and Part IV.G.5 establishes that no biological or health evaluation accompanied the transition it drove.

What the absence means at the point of purchase

The consequence for a public entity is specific and it is not abstract. There is no figure the entity can write into a procurement specification, no value it can require a bidder to meet, and no federal criterion against which it can reject a product that a resident later reports as disabling. Part VIII.G.2 sets out what disclosure at the point of procurement would supply, and Part IX.F sets out the disclosure the Foundation asks the Department to require.

The Foundation states two limits on this subsection. It does not assert that the Department is forbidden to act, and Part II.C sets out the one provision that conditions action on a determination by the Secretary. And it does not assert that writing such a standard would be straightforward: Part IX.I sets out the instrument it asks for, and Part IX.I.3 sets out the shape of the transition the Foundation regards as workable, including that products already installed are not the first object of it.

2. No federal exposure guidance exists for optical radiation from general lighting

There is no federal exposure guidance for optical radiation from general lighting. The Foundation states two qualifications in the same breath, because without them the sentence is refutable and would be refuted.

First qualification: exposure limits exist, and none of them is federal

Part II.D.5 sets out what exists. Recommended practice published by the Illuminating Engineering Society; the blue-light hazard exposure limits of IEC 62471 and ANSI/IES RP-27, which are consensus documents the Department does not administer; state and municipal outdoor lighting ordinances of widely varying stringency; and a model ordinance, which is a model. To those the respondent identification adds the guidelines of the International Commission on Non-Ionizing Radiation Protection on exposure to incoherent visible and infrared radiation, which are the work of a non-governmental body and bind no one in the United States. Part V.C.2 treats the blue light hazard framework in detail. Part II.D.5 records the two things that matter about the whole set: none of it was adopted following the study and evaluation that § 360ii(a)(4) directs, and none of it is enforceable by this Department.

Second qualification: the limits that do exist answer a different question

Part II.D.2 states the distinction this comment turns on and the Foundation applies it here. A hazard model asks whether an emission exceeds a level at which injury occurs. The blue light hazard framework is a well-built instance of that model, and the Foundation says so rather than disparaging it. But a self-evaluation does not ask whether a lamp will injure a retina. It asks whether a person can use the entity's service, reach its facility, and travel its path of travel. Those two questions come apart, and they come apart in a direction that matters: a general-service lamp assessed under the blue light hazard scheme will commonly return the lowest risk classification. That tells a city that the lamp will not cause photochemical retinal injury at the assessed distance. It does not tell the city whether the installation is suitable above a dwelling, whether it produces disabling glare at a crossing, or whether its modulation affects a person with a seizure disorder.

On three of the quantities a self-evaluation would have to reach there is no federal number of any kind, and the Foundation does not rely on its own assessment for that. The respondent identification records the source relied on for the state of the blue light hazard exposure limit, the absence of consensus on its revision, the inadequacy of present means of predicting discomfort glare, and the regulatory gap as to temporal light modulation. Parts V.C.4, V.D.3 and V.K set those out. Part III.D.7 treats glare rating and Part III.E.3 cumulative exposure as characteristics that require boundaries, and neither has one.

The occupational framework is addressed separately, at Part II.H.10, which records what the agency administering it said when the Foundation wrote to it. Nothing in that framework supplies a public entity with an exposure criterion for the lighting in a corridor the public walks down.

What a public entity can do with the non-federal documents, and what it cannot

It can read them, and it can adopt one. Some have, and Part III.D.5 records that the maxima which exist for light trespass are municipal and state rather than federal. The Foundation does not criticize an entity for adopting a consensus document; in the absence of anything else it is the responsible thing to do. What adopting one does not give the entity is a federal referent, and two consequences follow that Part VIII.E sets out: every entity researches the same question independently, at Part VIII.E.1, and entities reach inconsistent and conflicting determinations on the same facts, at Part VIII.E.2. A resident who moves between two jurisdictions encounters two answers, and neither is wrong, because there is nothing for either to be wrong about.

3. Public entities therefore have no federal referent for step 2 above

The Foundation states this subsection precisely, because the loose version of it would be useful to the wrong people and the Foundation does not intend to supply it. Nothing in this Part suggests that the absence of a federal criterion relieves any entity of any duty. The duty is owed. It attaches by regulation, it is enforceable, it runs whether or not this Department ever acts, and an entity that has not performed it is not excused by anything in this comment.

What is missing is the technical basis for performing one step of it. Part VIII.C sets out the four steps a self-evaluation of an emitting product would require. The first is performable: an entity can inventory the emitting products it operates, and nothing prevents it. The second cannot be completed. The third and fourth depend on the second, so they fail with it. The duty is owed in full and one step of the method has no federal input available to it.

Even "cannot be completed" needs stating carefully, because the entity can measure. Instruments exist, laboratories exist, and a municipality can commission a measurement and obtain a number for luminance, illuminance, spectral distribution or modulation depth. What it cannot do is evaluate the number it obtains. Evaluation requires something to evaluate against, and subsections 1 and 2 establish that no federal criterion exists for it to use. The absence is not an absence of data. It is an absence of a referent, and that distinction is the whole of this subsection.

What the Foundation says an entity should do in the meantime

It should record the gap rather than omit the subject, which is the one course open to it that is both honest and useful. A self-evaluation that examined the lighting the entity operates, stated what was measured or observed, and recorded that no federal criterion exists against which to evaluate it would be a better document than one that did not reach the subject at all. It would also be a document the public could see, because Part VIII.B.1 sets out the retention and public-inspection requirement that applies to entities above the employee threshold. The Foundation regards a record of that kind as valuable to this Department as well, for the reason Part IX.C gives.

What does not follow, and the Foundation says it plainly

The absence is not a defense to an individualized request, and an entity that treats it as one has misread the framework rather than been defeated by it. Part VIII.B.4 sets out the distinction. The individualized duty asks what this person needs in this facility, which is a question the entity can answer from the person's own account, its own observation and the alternatives available to it. It does not require a national criterion and it never did. Part VIII.F.5 sets out the one instance the Foundation has of an entity answering that question, and it answered it with no federal input at all. Part VIII.F.3 records that the absence of a federal criterion has nonetheless been given as a basis for denial, which is the misreading this paragraph identifies.

And the Department is not the entity performing the self-evaluation. The Foundation asks nothing of it in that capacity and makes no allegation about it in that capacity. What it asks is the referent, which Part VIII.G describes and Part IX.I requests. Part VIII.B.3 records the one capacity in which this Department would itself have to apply the missing referent, as the agency designated to investigate complaints against a class of public entities, and that is the narrowest statement of why the absence is this Department's concern rather than somebody else's.

4. Where the accessibility framework does set an optical number, it sets a ceiling on the flash rate and a floor on the intensity

The Foundation states this subsection carefully, because the obvious objection is that the accessibility framework says nothing at all about light, and that objection is wrong. It says a good deal. What it does not do is bound the quantity this comment is about.

The visible alarm is the case. Section 4.28.3 of the Accessibility Guidelines issued under the Act specified, for a visual alarm signal appliance, that the lamp be a xenon strobe type or equivalent; that the color be clear or nominal white; that the maximum pulse duration be two tenths of a second with a maximum duty cycle of 40 percent; that, in the words of the provision, the intensity shall be a minimum of 75 candela; and that the flash rate shall be a minimum of 1 hertz and a maximum of 3 hertz.

Read those two numbers against each other. The flash rate is bounded in both directions, with an express ceiling. The intensity is bounded in one direction only, and the direction is upward from a

floor. There is no maximum intensity in the provision, and no maximum luminance anywhere in it.

The framework knew what it was leaving out. The manual the Access Board published to explain the guidelines states that a signal must be of an intensity that will raise the overall light level sharply, but not be so intense as to be unsafe for direct viewing. That is an acknowledgment, in the explanatory text of the accessibility framework itself, that an intensity can be unsafe to look at. No number is attached to it. The same manual records that flash rates above 5 hertz may trigger seizures in people with certain forms of epilepsy, that this is a particular concern in schools because children are frequently more affected by photosensitivity than adults, and that composite flash rates above 5 hertz should be avoided by synchronizing or decreasing the flash rate. That last statement appears as a recommendation and not as a requirement.

The consequence of that drafting choice is arithmetical, and the manual states it. A single appliance is capped at 3 hertz. Two appliances in the same space, each compliant at 3 hertz and not synchronized with each other, can present a composite rate of 6 hertz. Synchronization is recommended. So a corridor or a room may lawfully present a person with a composite flash rate above the figure the framework's own manual identifies as a seizure threshold, and the only instrument against that outcome is a recommendation.

And the direction of the guidance on intensity is upward. Technical assistance issued on these provisions describes the 75 candela figure as a minimum performance criterion rather than a lamp specifying standard, recommends that visual alarm lamp intensity be maximized so as to require the minimum number of fixtures, and records that lamps of up to 1,000 candela are available for some applications. The Foundation draws no inference about anyone's intent. It states the position: in a framework whose own manual says an intensity can be unsafe for direct viewing, the guidance on intensity recommends maximizing it, and no provision caps it.

The current standards reach the same place by a different route. Section 702 of the 2010 Standards does not restate the photometric specifications. It requires compliance with the National Fire Protection Association's standard for fire alarm systems, incorporated by reference. The Foundation has not read that standard, which is not publicly available, and asserts nothing about its contents.

One number in the incorporated scheme is worth setting beside the others, because the comment has now met it three times in other places. The referenced fire alarm standard caps an audible notification appliance at a stated sound pressure level. The sound a notification appliance may produce is capped. The light a notification appliance may produce is not.

The same asymmetry, in four federal places

The Foundation sets these together because the pattern is the argument, and each element of it is verifiable without leaving the primary sources.

- **Toys.** Federal law limits the sound a toy may emit, by a numerical criterion measured at a prescribed distance, for the stated purpose of protecting a child's hearing. It does not limit the light. Part VI.M.3.
- **Alarms in dwellings.** A federal regulation fixes a minimum luminous intensity in candelas for a visible notification appliance in a room designed for sleeping. It fixes no maximum for anything. Part IX.J.
- **Visible alarms under the accessibility framework.** Flash rate capped, intensity floored, luminance unaddressed, and the guidance recommends maximizing the intensity. This subsection.
- **Audible and visible appliances in the same standard.** The sound is capped. The light is not. This subsection.

The Foundation does not argue from this pattern that any of those agencies has failed in a duty. Each acted within its own authority and none holds the authority of 21 U.S.C. § 360kk. The pattern is offered for a narrower proposition, which is the proposition of this Part. When the federal government has wanted to bound an emission from a product, it has known how: it has named the quantity, fixed the number, prescribed the measurement and set the condition. It has done that for sound in a toy and for sound in an alarm. For the light, in every one of these places, it has either set a floor or said nothing. The instrument that would set the ceiling is the one this comment is about, and it has not been used.

E. Consequences of the Gap

Part VIII.D establishes two absences. This subsection sets out what they cost, and it separates the costs because they fall on different people. Subsections 1 to 3 describe what the absence does to the public entities that hold the duty. Subsection 4 describes what they turn to instead and why it does not answer the question. Subsection 5 describes what happens to the person the duty exists for when the systemic part of it cannot be performed. Subsection 6 then sets out two documents about the same city, four months apart, which show the whole of it in a single instance.

The Foundation offers no monetary estimate anywhere in this subsection and subsection 3 states why. Everything else in it is either in the record of this comment or is a matter of public arithmetic the Department can check.

1. Every state and municipal entity must independently research the same question

The duty at 28 C.F.R. § 35.105 runs to each public entity separately. It is not discharged for a city by a determination made in another city, by a state agency, or by any federal body. Each entity owes it on its own account, and each therefore has to reach its own understanding of what the lighting it operates does to the people its programs serve.

The number of entities is large. The Census of Governments counts approximately ninety thousand units of local government in the United States, comprising counties, municipalities, townships, school districts and special districts, before any state agency or state university system is added to them. The Foundation cites the figure as an order of magnitude rather than as a precise count, and it is the order of magnitude that matters: the question Part VIII.C describes has to be answered independently tens of thousands of times.

What each of them has to research is the same four things, and Part VIII.C sets them out. Which emitting products the entity operates. What each of those products emits. Which populations are affected by it. And what the alternatives emit. The first is work the entity can do and nobody else can do for it, because only the entity knows its own inventory. The other three are not local questions at all. What a particular luminaire emits is a fact about that luminaire, identical in every jurisdiction in which it is installed. The level at which a person is affected by that emission is a fact about human physiology and does not vary by county.

So the research is not merely duplicated. It is misallocated. Each entity is required to answer two questions that have the same answer everywhere, using whatever capability it happens to have, and Part VIII.D establishes that none of them can complete the second. A city of four thousand people and a state with forty million face the same question with incomparable resources, and the smaller the entity the less likely it is that the question will be reached at all.

The Foundation states the limit of this subsection. It does not assert that every public entity has in fact attempted this research, and it has no survey showing how many have. The subsection is about what the duty requires of each of them and what it would take to perform it, and Part VIII.E.6 supplies the one documented instance in which an entity was asked the question directly and the record of what it did.

2. Inconsistent and conflicting determinations across jurisdictions

When the same question is put to different bodies with no common referent, they answer it differently. That is not a criticism of any of them and the Foundation does not offer it as one. It is what happens when each decision-maker has to supply its own premise.

The record of this comment contains four dispositions of substantially the same exposure, and the Foundation sets them beside one another because the contrast is the evidence.

A federal agency declined it. On October 19, 2022 the Office of Civil Rights of the Federal Highway Administration dismissed a complaint about flashing beacons in three cities without investigating it, on the ground that the subject extended beyond its authority. Part VIII.E.6 sets out the letter and Part II.H.18 the regulatory ground.

A state civil rights agency investigated it and found probable cause. On June 15, 2023 the Minnesota Department of Human Rights determined that there was probable cause on a charge concerning a beacon in one of those same three cities. Part IV.E.1 and Part VIII.E.6 set out the determination, including what it found and what it expressly declined to decide.

A state utility regulator opened a proceeding. Part IV.E.2 sets out the matter before the New York State Public Service Commission concerning street lighting in the Village of Cambridge, in which fifty-two residents of the village appeared.

A municipality provided an accommodation. Part VIII.F.5 sets out the sequence in Ketchikan, Alaska, in which a resident requested accommodation of a street lighting installation and the city substituted a different source technology.

What the Foundation draws from the four, and what it does not

It does not draw that any of the four was wrongly decided, and it does not compare them as if they were holdings on the same question. They are not. They arose under different legal frameworks, before bodies with different authority, in different procedural postures, and three of the four never reached a merits determination at all. A reader who treated them as four answers to one question would be overreading them and the Foundation says so before anyone else has to.

What they do establish is narrower and is not affected by any of that. Put to four bodies, the question whether an optical emission in the public way is a matter the body can address produced four different answers: beyond our authority, within our authority and probable cause exists, within our authority and worth a proceeding, and within our authority and here is the accommodation. The threshold question of whether the subject is cognizable at all is being answered differently by different governments in the same country in the same period, and that is a consequence of there being no federal determination for any of them to start from. Part VIII.G.4 sets out what a common referent would do for the consistency of these decisions.

The Foundation adds the consequence for the person rather than for the institutions, because it is the one that matters. A resident's prospect of relief from the same installation presently depends on which state they live in and which body they happen to petition. Nothing about their condition or about the emission changes when they cross a state line.

3. Duplicated cost across thousands of public entities

The Foundation offers no dollar figure in this subsection and states the reason first, because a comment that produced one would invite the Department to test it. The Foundation has not surveyed public entities, has not obtained a procurement or consulting invoice from any of them, and has no basis on which to estimate what the research costs a city. It will not supply a number it cannot support. What it can describe is what the expenditure consists of and why its structure is wasteful independent of its size.

What it consists of, for an entity that attempts the work: staff time to assemble the inventory at Part VIII.C.1; the purchase of consensus standards, which are copyrighted documents sold by the bodies that publish them; photometric or radiometric measurement, which requires either instruments the entity does not own or a contractor; review of a technical literature the entity has no basis for appraising, which Part V.A describes for the Department's own purposes; and legal review of whatever conclusion is reached.

Why its structure is wasteful is the point of the subsection, and it does not depend on the amount. Part VIII.E.1 establishes that two of the four research questions have the same answer in every jurisdiction. An entity that answers them well produces a result that binds nobody and transfers to nobody: the next entity cannot rely on it, because it holds the duty on its own account and the first entity's conclusion is not authority. So the expenditure is incurred repeatedly and generates nothing cumulative. A federal characterization of the emission would be researched once, at one expense, and would then be available to every entity that needed it. That is the ordinary justification for a federal technical standard and the Foundation advances no novel version of it.

And the expenditure does not buy the answer. This is the part that distinguishes this subject from an ordinary duplication-of-effort argument. An entity that spends what it takes to commission a measurement still has no criterion to evaluate the measurement against, for the reason Part VIII.D.3 gives. The money produces a number and the number resolves nothing. The entity is then in the position Part VIII.D.3 describes, holding data it cannot interpret and a duty it cannot complete.

The smaller the entity the more of this is simply not done, and the Foundation states that as the practical consequence rather than as an allegation about any particular entity. A duty whose performance requires capability the duty-holder does not have is a duty that goes unperformed, and Part VIII.E.5 sets out what then carries the subject instead.

4. Reliance on industry and trade guidance in place of a federal standard

An entity that cannot find a federal criterion does not stop. It finds the best document available to it, and the documents available to it are the ones Part II.D.5 lists: recommended practice published by the Illuminating Engineering Society, the consensus standards of the international bodies, manufacturer literature, and utility or state energy program materials. Part II.E.4 sets out the professional and standards organizations that produce them.

The Foundation does not criticize an entity for relying on them. In the absence of anything else it is the responsible course, and the documents are competent work within their own purposes. The difficulty is with the purposes, and it is a difficulty of direction rather than of quality.

The numbers in trade lighting guidance are floors

Lighting practice documents exist to specify enough light for a task. Their quantities are accordingly minima: the illuminance recommended for a classroom, a parking structure or a surgical field is a level below which the task is not adequately served. A document built that way can answer the question whether there is too little light. It has no apparatus for answering whether there is too much, because that was never the question it was written to answer.

Part VIII.D.4 shows the same direction inside the accessibility framework itself, where the intensity of a visible alarm is bounded below and not above and the technical assistance recommends that the intensity be maximized. Part IV.G.4 shows it in the federal efficacy framework, whose measure is light output per unit of energy. An entity assembling the available guidance is therefore assembling a set of documents that point in one direction, and the direction is upward. It is liable to adopt a floor and treat it as though it were a specification, because a floor is what it has been given.

And the bodies that write them are not neutral as to the product

The Foundation states this structurally and makes no allegation of bad faith against any organization. The membership of the standards and professional bodies that publish lighting

guidance includes the manufacturers of the products the guidance describes, and Part II.E.4 names the organizations. That is the ordinary constitution of a consensus standards body and it is not a defect in itself; it is how such bodies are built, and the Department relies on consensus standards in other programs for good reasons. The observation is narrower: a document produced that way is not a substitute for a determination by the agency Congress charged with minimizing the emission, and nobody involved in producing it has claimed otherwise.

Reliance does not protect the entity either

This is the practical point, and the record establishes it. An entity that follows the available guidance and is then presented with a request for accommodation discovers that conformity is not an answer. Part VIII.E.6 sets out the footnote in the Minnesota determination which held that the city's contention that the beacon's flash rate conformed to federal guidelines was irrelevant to whether providing an accommodation was reasonable. So the entity has borne the cost of the research, adopted a document pointing in the wrong direction, and acquired no protection from it. Part VIII.G.1 sets out what a federal referent would give it instead.

5. The systemic duty defaults into the individualized one

This is the consequence the Foundation regards as the most important in this Part, and it is a consequence for a person rather than for an institution. Part VIII.B.4 sets out the distinction between the systemic duty and the individualized one and this subsection does not restate it. What it describes is what happens to the second when the first cannot be performed.

The mechanism is simple. A systemic duty that cannot be completed produces nothing at the program level: no characterization, no modification, and no document, for the reason Part VIII.D.3 gives. Nothing announces that it has not been performed. The subject therefore does not arise at all until an individual raises it, which means that the only route by which an optical emission becomes addressable is a request for accommodation by a person already affected by it. The duty designed to operate in advance of harm has dropped out, and the duty designed to respond to a particular person is carrying the whole subject.

Four things follow, and the Foundation sets them out in the order of how much they cost the person.

The work transfers. The systemic duty places the inquiry on an entity with staff, a budget, procurement authority and counsel. The individualized duty places the initiative on one person, who must identify the source, describe its effect on them, make the request, and sustain it. Part VIII.F.2 describes that burden and Part VIII.E.6 contains a chronology of it: the charging party there contacted the city on seven separate dates across three months before the agency took the matter up.

It is retail rather than wholesale. An accommodation resolves one installation for one person. The same question then arises again, in the same jurisdiction, for the next person and the next installation, and the entity answers it again from the beginning. Nothing accumulates.

It reaches only those able to pursue it, and the selection operates against the people the duty exists for. A process requiring months of correspondence, a written account of one's own condition, and persistence against an entity that may not reply is a process some people can run and others cannot. The populations Part III.F identifies as most affected by an optical emission include people for whom sustained administrative correspondence is itself difficult. The Foundation does not quantify that and does not need to; the direction of the effect is not in doubt.

And it produces no record. An individualized resolution binds nobody, is frequently not published, and in some instances is confidential. So the one route by which the subject is presently addressed is also the route that generates the least information, which is why Part VII exists and why Part IX.C asks the Department to characterize the emission rather than wait for the record to assemble itself.

What the Foundation is not saying

It is not saying that the individualized duty is the wrong mechanism, or that it should be narrowed, or that an entity may decline a request because the systemic duty went unperformed. Part VIII.D.3 states the opposite. The individualized inquiry is the right method for an individual question and the Foundation asks for no change to it. What it says is that the mechanism is bearing a load it was not designed for, and that the part of the framework designed to operate before anyone was harmed is the part that has no technical input available to it. Supplying that input is what Part IX asks of this Department.

6. One agency dismissed the question as outside its authority; another investigated the same city and found probable cause

Everything in this Part to this point describes an absence. The Foundation closes the subsection with two documents about the same city, four months apart, because together they show what the absence costs and what it does not.

The federal disposition

On October 19, 2022 the Office of Civil Rights of the Federal Highway Administration dismissed, without investigation, a complaint under Title II and Section 504 concerning the use of rectangular rapid flashing beacons by three cities, one of them Little Canada, Minnesota. Appendix E.9. The letter gave two grounds. The first was that no statutory requirement obliges an enforcement agency to investigate every Title II complaint, which the Foundation accepts without reservation. The second was this:

> "The allegations you have raised about the health impacts of RRFBs raise complex issues related to the regulation of all Light Emitting Diode (LED) lights, not just those used in RRFBs, that extend beyond FHWA's authority."

The Foundation asks the Department to read that sentence as the statement of a sister agency about the location of a subject. The agency whose Manual on Uniform Traffic Control Devices authorized the device, presented with a complaint that the light the device emits harms people with disabilities, answered that the question is about the regulation of light-emitting diode lights generally, that it is not confined to the device complained of, and that it lies beyond what that agency may reach. It did not say where the subject does lie. Part II.H identifies the only chapter of the United States Code that places it anywhere.

The state determination, on the same city

On September 28, 2022, nine days before that letter, a resident of Little Canada filed a charge of discrimination with the Minnesota Department of Human Rights. She is a woman with a disability whose symptoms, in the determination's words, are triggered by high-luminance, strobing LED lights. The charge concerned a pedestrian rectangular rapid flashing beacon installed at a crosswalk on the public street next to her residence, a unit containing two flashing diodes. On June 15, 2023 the Commissioner of that Department issued a memorandum of determination, reference 74059, finding probable cause that the city had discriminated against her because of her disability, in violation of the Minnesota Human Rights Act.

The Foundation sets out the findings rather than characterizing them, because the facts carry the matter. The charging party was affected by the beacon on January 4, 2022 and was unable to go to work the following day. She contacted the city on January 6, on January 17, on January 27, on February 15, on February 23, on March 2, by letter on March 17, and by electronic mail on April 5. The determination records that she contacted the city at least eight times and that the city ignored her. It records that several members of the city council blocked her advocate's electronic mail address in order to avoid receiving his communications. It records that a state agency with expertise in the field advised the city on February 4, 2022 to treat her request as an official complaint, to commence an investigation, and to ask her about her photosensitivity and her

experience with other devices, and that the agency expressed no concern that accommodating her would affect pedestrian safety. It records that the city decided not to ask her those questions because it believed doing so would have, in its own word, aggravated the situation. It records a vendor quotation of 8,616 dollars and 45 cents to replace the lights, which the city did not bring to its council and did not analyze. And it records that when the vendor was asked whether a slower flashing rate was available and could not find one, the city's public works director wrote that the city would stick with what it had, because it still received favorable comments on the existing module and because, in the director's words, the person causing all of the trouble had not sent anything in a while.

The Department determined that the city failed to engage in the reasonable accommodation process, and found, in terms, that the city intentionally refused to engage in good faith and failed to take any meaningful steps to determine whether a reasonable accommodation was even possible. It never notified her that her request had been denied.

The footnote that governs how this comment may use the determination

The Foundation brings forward the passage most adverse to its own framing, because it is the passage that disciplines this Part. The city had argued that the beacon's flash rate was consistent with federal guidelines. The determination answers in a footnote that the contention is irrelevant to whether providing an accommodation would have imposed an undue hardship.

That cuts two ways and the Foundation gives both. In its favor, it establishes that conformity with a federal guideline is not an answer to an accommodation request, which is the proposition this comment advances throughout Part V.C.2 about conformity generally. Against it, and more importantly, it establishes that the absence of a federal emission criterion is not a defense either. The duty under the state statute was owed, it was assessed on undue hardship and on the four statutory factors, and the determination reached a conclusion without any federal number. So this Part must not be read, and the Foundation does not advance it, as a claim that the absence of a standard under 21 U.S.C. § 360kk prevents a public entity from complying with its obligations. It does not. The entity in this case failed to comply for reasons that had nothing to do with the state of federal science: it did not answer letters, it did not cost the quotation it had obtained, it did not ask the questions it was advised to ask, and it recorded its reason for stopping in a sentence about the complainant rather than about the light.

What the Foundation does take from the pair

Two things, and they are narrower than the documents might support. First, that the inquiry is tractable. A civil rights agency given the question whether a flashing light-emitting diode device in the public way discriminated against a person with a disability did not find the question unanswerable; it investigated and it answered. Part VIII.C asks what a self-evaluation of an emitting product would require, and this determination is the only instance the Foundation has found of a public body being held to that inquiry on these facts.

Second, and this is the proposition this Part exists to establish, that the federal government declined the same question about the same city. One agency was asked and said the subject was beyond its authority. A state agency was asked and reached a determination. The Foundation does not say the federal agency was wrong about its own authority; it has no reason to doubt it and Part II.H proceeds on the assumption that it was right. The point is where the subject went when that agency set it down. It did not go to another federal agency. It went to a state human rights department, one charging party at a time, and the twenty-one entities described at Part IV show how seldom that route produces anything at all.

What followed, in each of the three cities

The Foundation completes the record rather than leaving the reader to assume an outcome, because the outcomes are adverse to the impression the two documents above might otherwise leave.

Little Canada, Minnesota. Nothing followed the determination. A finding of probable cause is a stage in an administrative process and not an end, and the State declined to take any further step. The Foundation does not know the reason and does not speculate. The beacon is not recorded as having been changed. So the one instance in which a civil rights agency investigated this question and found probable cause produced no remedy for the person who brought it.

Ashland, Oregon. Mr. Baker brought an action in state superior court in his individual capacity. He dismissed it voluntarily when he moved from Oregon to California. There was no decision on the merits.

Penn Yan, New York. No further action occurred.

The Foundation states what that leaves. Of the three cities in the complaint the Federal Highway Administration declined to investigate, one produced a state probable cause determination that led to nothing, one produced an action abandoned for reasons unrelated to its merits, and one produced nothing at all. The Foundation does not offer that as evidence that any of the three cities violated any law; two of the three were never adjudicated and the Foundation makes no allegation about them here. It offers it for the proposition this Part has been building: that where the federal government has declined the question, what remains is one person at a time, in one forum at a time, and the record of what that produces is the record set out above.

F. Individual Requests for Accommodation

This subsection is about what happens when one person asks one entity to do something about a light. Part VIII.B.4 sets out the duty that a request engages and Part VIII.E.5 sets out why that duty is carrying the whole subject. What follows is the record the Foundation has of requests actually made.

The Foundation states the size of that record before relying on any of it. Of the 593 reports at Appendix A, ten describe the reporter contacting anybody at all about the lighting, and four describe a request made to an entity responsible for the lighting together with the answer that came back. Subsection 4 sets out those four. The number is small, and subsection 4 also explains why it is small, which is a fact about the Foundation's own collection instrument rather than a measure of how often such requests are made.

1. What individuals are told when they request accommodation

Four answers are in the record, and the Foundation sets out what each of them says before drawing anything from them. Subsection 4 gives the accounts in the reporters' own words with the appendix citation for each.

The first is an answer about authority. A reporter in Escondido, California asked the membership manager of a warehouse club store to switch off two lighting demonstration displays after both produced headache and blurred vision on the way in. The manager answered that he could not do anything and would have to confer with the corporate office. Appendix A.55.

The second is no answer. A reporter in West Deptford, New Jersey, unable to shop at a supermarket since its checkout lighting was increased, spoke to the manager and then wrote to management. The report records that the written requests received no reply of any kind. Appendix A.115.

The third is an answer demanding documentation. A reporter in Rochester, New York asked his employer's human resources department to let him start and finish earlier so that he would not have to drive home after dark. He was told he needed a note from a doctor. Appendix A.156.

The fourth is a refusal with reasons, and it is the fullest account in the record. A reporter in Bennington, Vermont asked a hospital to designate a part of its emergency department and other areas as free of light-emitting diode lighting, after an emergency visit in which she began to shake on being wheeled into the lit emergency room and was ultimately treated in a back hallway near the

ambulance bay. She was told her request would be passed on and answered in two weeks. Two months later she was told that the hospital had recently remodeled with this lighting throughout and was not going to remove or alter any of it, and she was given three options: telephone ahead, be admitted and medicated when she began to convulse, or go elsewhere. The report records that the next hospital is more than twice as far away. Appendix A.171.

What the four answers have in common

Not one of them is about the light. None of the four responses states what the installation emits, at what level, how it compares to anything, or whether a different product would serve the same purpose. The answers are about the authority of the person who received the request, about whether the requester can produce a physician's letter, about the cost of work recently completed, and about where else the requester might go. The emission itself, which is the subject of the request, does not appear in any of them.

The Foundation does not offer that as a criticism of the four entities, and in at least two of the four the person answering plainly had no authority to do anything else. It offers it as evidence of the shape a request takes when it arrives somewhere that has no way to treat it as a technical question. Part VIII.C establishes that the entity has no characterization of the emission available to it and Part VIII.D establishes that no federal referent exists. An entity in that position answers in the terms it does have, which are terms about authority, documentation and cost.

One of the four reports contains the alternative in the same breath as the refusal, and the Foundation draws attention to it because it bears on what is feasible. The West Deptford reporter records that another store of the same chain, recently remodeled, installed lighting that does not affect him at all, and that he drives a sixteen mile round trip to shop there. Whatever the second store did was available to the first. Nothing in the federal apparatus told either of them what the difference was.

2. The burden of establishing harm shifted onto the requester

A request for accommodation of an optical emission requires the requester to do four things, and the Foundation sets them out in order because each one is harder than the equivalent would be for a barrier of any other kind.

Identify the source. A person affected by lighting in a store, a corridor or a street has to work out which installation is doing it, often among several, and often while symptomatic. Part VII.D records what reporters describe doing to avoid the exposure, which is the same identification problem approached from the other side.

Describe its effect with no instrument and no threshold. This is the step that distinguishes this subject. A person requesting a ramp can point to a step and the step is self-evidently the barrier. A person requesting something about a light has to establish both that the light affects them and that it is the light, and Part VIII.D establishes that there is no figure they can cite and no measurement they could commission that would mean anything against a threshold, because no threshold exists. The requester is therefore the only available instrument.

The record shows people acting as that instrument. The West Deptford reporter timed his own symptom onset and reported it to the minute, recording that the pain begins in five to eleven minutes and that he had timed it. Appendix A.115. A person who times their own symptoms is a person generating the only evidence available to them, and the Foundation notes that the figure is more precise than anything the federal government has published about the exposure that produced it.

Supply clinical corroboration on demand. The Rochester reporter was told he needed a note from a doctor. Appendix A.156. The Bennington reporter's physician telephoned the hospital in advance and obtained an assurance from the head emergency nurse, which did not hold when she arrived. Appendix A.171. Neither requirement is improper and an entity is entitled to information. The point

is where the cost of producing it falls, and that it falls on a person who is asking for relief from something the entity installed.

Sustain the request. Part VIII.E.6 contains the chronology: a charging party who contacted her city on seven separate dates across three months before a state agency took the matter up. The Bennington reporter was promised an answer in two weeks and received one in two months. A process of that length is a process some people can run and others cannot, and Part VIII.E.5 sets out why the selection operates against the people the duty exists for.

The asymmetry, stated plainly

The entity that installed the product has the invoice, the specification sheet, the product literature and whatever the manufacturer told it. The requester has their own account of their own symptoms. The party holding the technical information about the emission is the party being asked to act, and the party with none of it carries the burden of establishing that the emission is a problem. Part VIII.G.2 sets out what disclosure at the point of procurement would do to that asymmetry, and Part IX.F sets out the disclosure the Foundation asks the Department to require.

The Foundation states one limit. Nothing here suggests that an entity must grant every request, or that a requester's account is conclusive. Part VIII.B.4 describes an inquiry, and an inquiry can properly end in a denial. The objection is to the inquiry being conducted with the evidentiary burden on the only participant who has no access to the facts about the product.

3. Whether the absence of a federal criterion is given as a stated basis for denial

The Foundation expected to find that entities deny these requests by pointing to the absence of a federal standard, and it reports that it did not find it. In none of the four accounts at subsection 4 does the entity give the absence of a federal criterion as a reason for anything. The Foundation states that because the heading of this subsection was written as an expectation and the record did not bear it out.

What the entities gave as reasons were these: that the person answering lacked authority; that the request needed a physician's note; that the building had recently been remodeled; and, in one instance, nothing at all. Appendix A.55, A.156, A.171 and A.115 respectively.

What the Foundation draws from the absence of that reason

The honest reading is that the absence of a federal criterion does not operate as a stated ground of denial because it does not need to. It operates earlier. An entity that had a federal characterization of the emission available to it would have a technical question in front of it: what does this installation emit, what does the criterion permit, and what would the alternative emit. None of the four entities had that question in front of them. What arrived instead was a request they could only process as a matter of authority, documentation or expense, and they answered it in those terms. The missing criterion is why the request never became a technical question, not a reason offered for refusing one.

That reading is weaker than the heading promised and the Foundation prefers it because it is what the record supports. It is also, on reflection, the more useful proposition for this Department, because it bears on what a performance standard would change. A standard would not give entities a better reason to refuse. It would change what kind of question the request is, which is what Part VIII.G.4 describes.

Where the absence has been given as a reason, and by whom

One place in the record does state something close to it, and the Foundation is careful about what it was. Part VIII.E.6 sets out the determination of the Minnesota Department of Human Rights, in which the city argued that the flash rate of its beacon conformed to federal guidelines. That is the converse: not an entity citing the absence of a federal criterion, but an entity citing the presence of a federal guideline as an answer to an accommodation request. The determination rejected it in a footnote as irrelevant to whether providing an accommodation was reasonable. So the one

documented instance of an entity invoking the federal position invoked it the other way, and was told it did not answer the question.

And one federal agency has given a version of it. Part VIII.E.6 and Part II.H.18 set out the letter in which the Office of Civil Rights of the Federal Highway Administration dismissed a complaint without investigation on the ground that the subject raised issues extending beyond that agency's authority. That is an agency declining a question for want of authority over the subject rather than an entity declining an accommodation for want of a criterion, and the Foundation does not conflate the two.

One further item belongs here for completeness because it is the only response in the record from a federal agency to a member of the public about these products. A reporter in Hancock, Wisconsin recounts nearly striking a pedestrian he could not see past an oncoming vehicle's headlamps, reporting it to the National Highway Traffic Safety Administration, and being told that the lights just seem brighter. Appendix A.35. It is not an accommodation request and the Foundation does not present it as one. It is recorded because the answer is a statement about the emission, which is the one subject none of the four entity responses reached, and because it is the answer a member of the public received from the agency Part II.H.5 addresses.

4. Documented examples from the incident report record

The Foundation sets out the four accounts in the reporters' own words, with the appendix citation for each, and states the limits of the set first.

The size of the set, and why it is small

Of the 593 reports, ten describe the reporter contacting anyone about the lighting. Four of those describe a request to an entity responsible for the lighting together with the response. The remaining six are a report to a federal agency, two accounts of calling the police about conduct by another driver, one of notifying a restaurant manager about an unrelated emergency, one of an exchange with a hotel employee who had switched the lighting off for her own reasons, and one of writing an article.

The reason the number is small is in the collection instrument rather than in the world. Part VII.A.1 describes the submission form. It asks the reporter to describe the incident or the impact of light-emitting diodes on their life. It does not ask whether they requested an accommodation, from whom, or what the answer was. So four is the number of reporters who happened to mention a request while describing something else, and it is not a measure of how many made one. The Foundation states that rather than presenting four out of 593 as a rate, and Part IX.D asks the Department to establish a surveillance system that would ask the question directly.

a. A warehouse club store – Escondido, California

> I was assaulted by an LED demonstration light. Immediately I got a headache and my vision turned blurry. Even after getting past the light, the effects lingered. As I walked down the first aisle, another demonstration light hit me, with the same result. I spent the rest of my time shopping under duress. I spoke with [the] membership manager, and explained how dangerous those lights are, especially to people with neurological sensitivities, that they can cause seizures and worse, and requested that they be turned off. He said he couldn't do anything. He would have to confer with the corporate office.

Appendix A.55, June 5, 2024. The reporter entered no condition category. The name of the employee appears in the report as received and is omitted here.

b. A supermarket – West Deptford, New Jersey

> For the past few years I have been unable to shop at the local [supermarket] ever since they doubled or even tripled the amount of lighting above the checkout lines. I get migraine symptoms within minutes even while wearing my tinted glasses and a wide brimmed hat to bloc much of the light. The lighting is that intense. I get visual

> distortions, nausea, and the Pain starts in about 5 to 11 minutes (I've timed it) I can no longer shop at my local supermarket. The manager I spoke to had callous disregard for my condition, and my emails to management have received zero replies of any kind. Other [stores of the same chain] aren't nearly this bad. The [nearby] location recently remodeled and installed DECENT, HUMAN LIGHTING that doesn't bother me at all.

Appendix A.115, September 3, 2024, condition category photophobia. The report continues that the reporter pays higher prices at a different chain or drives a sixteen mile round trip, and records the fuel and mileage as financial damage. Trade names in the report are replaced here with descriptions.

c. An employer – Rochester, New York

> I don't get out of work until 5. Its dark! Then I have to run the gauntlet of deer and on coming traffic melting my skull off my neck with these insane projector headlights. … Night driving is like looking into the sun, it hurts! I've had to ask HR if I can come in early and leave early. They said I need a note from a doctor….gah! I attach a manila folder to my drivers side visor with a big binder clip so I can hide behind it when oncoming traffic approaches. Tell me, how safe is that!

Appendix A.156, November 18, 2024, condition category recorded as other. This is the one request in the set made to an employer rather than to a public entity or a place of public accommodation, and Part VIII.B.6 sets out the provision that reaches it. The report opens by stating that the reporter is risking the loss of his job.

d. A hospital emergency department – Bennington, Vermont

> When I recovered, I called the hospital to discuss the need for a section of the ER and other parts of the hospital complex to be LED-free, clearly labeled, so that anyone with an LED-reactive medical condition can be safely, promptly seen and treated. I asked them to think of it as a disability aid, exactly like the need to have ramps and braille, to consider safe lighting a medical necessity, like being vigilant about dietary restrictions for their patients. The staff member said they would pass on my request and get back to me in two weeks. Two months later, this is what I was told: The hospital had recently remodeled with all LED lighting and wasn't going to remove or alter any of it.

Appendix A.171, November 24, 2024, condition category epilepsy. The report sets out what preceded the request: the reporter's physician telephoned ahead and was assured by the head emergency nurse that she would be treated in a setting free of this lighting; the assurance did not hold on arrival; she began to shake on being wheeled into the emergency room; and a treatment area was improvised in a back hallway near the ambulance bay, reached by pushing her wheelchair around the outside of the building. It also sets out the three options she was given after the refusal, and that the next hospital is more than twice as far away.

Why the fourth account is the one the Foundation asks the Department to read

It is an account of a request for an accommodation of lighting, made to a hospital, refused on the ground of a recent remodel, with sedation during treatment offered as one of three alternatives. The Foundation does not characterize the hospital's conduct, does not assert that any provision was violated, and has no record of the matter beyond the reporter's own account. What it asks the Department to notice is the subject matter. Part VIII.B.3 records that this Department is the agency designated under Title II for programs, services and regulatory activities relating to the provision of health care and social services. A request for accommodation of lighting in a hospital falls within the class this Department was designated to receive complaints about, and Part VIII.D establishes that this Department has published nothing that would tell either the hospital or the complainant what the lighting may emit.

5. One accommodation sought and granted, and what it required of everyone involved

The subsections above describe what the absence of a criterion does to a request for accommodation in general terms. This subsection works through the single instance the Foundation has, because the

particulars show the cost more clearly than the generality does. The instance and the basis of the Foundation's knowledge of it are set out at Part III.G.3, including that the account of why the substitution was made is the Foundation's own statement rather than a cited document.

a. The sequence

A municipality converted its street lighting to light-emitting diodes in February 2021, to unshielded sources of four to five thousand kelvin. A report at Appendix A.158 describes that conversion and its effect on the reporter. A resident whose dwelling overlooks one of the streets requested an accommodation under the Americans with Disabilities Act, on the basis that the installation was producing adverse reactions in them. The city provided the accommodation requested: three amber low-pressure sodium sources were substituted for the blue-rich ones and placed in service on April 3, 2026.

b. What each participant had to work with, which was nothing

The requester had to establish that the installation affected them. There is no federal criterion stating what a street lighting installation may emit, so there was no figure the requester could point to and no measurement they could commission that would have meant anything against a threshold. Part VIII.F.2 describes that burden in general; here it fell on one person describing their own experience.

The city had to decide. It had no criterion either, and Part VIII.C sets out why the self-evaluation it would have conducted could not have reached a characterization of the emission. What it had was the request, the account in it, and whatever judgment its own officers brought. Nothing in the federal apparatus told it what to measure or what value to measure against.

And the remedy it chose was a substitution of source technology rather than a limit on emission, which is the only kind of remedy available to an entity that cannot specify a limit. Part III.G.3 treats substitution as a technique and sets out both why it points in the right direction and what it costs.

c. What the Foundation draws from it, and what it does not

It draws two things. The framework is capable of reaching this subject: a request under a disability provision produced a change in an optical emission, which is a more useful fact for the Department than any number of complaints that produced nothing. And the result was obtained without any federal input at all, which means it was available to that municipality and is not available as a matter of right anywhere, because nothing in the sequence turned on an obligation the city could have been held to.

It does not draw that the outcome was correct, that the substitution is the right remedy generally, or that other municipalities would or should reach the same result. One instance in one city, in which three luminaires were changed and nothing was measured before or after, establishes none of that. The Foundation states it because it is the only instance it has, and because a Part that described a systemic failure without acknowledging the one case in which the system produced a result would be an incomplete account.

G. What a Federal Performance Standard Would Supply [RFI Q9]

This subsection answers Question 9 of the notice and the question a reader of this Part will have formed by now. If the absence of a federal criterion is the difficulty, what would a criterion actually do? The Foundation answers in five parts and keeps them separate, because they are different benefits accruing to different people, and because the fifth is the one most likely to be misunderstood.

One distinction governs the whole subsection and the Foundation puts it first. A performance standard prescribed under 21 U.S.C. § 360kk bounds what a product may emit. It is not an accessibility standard and it does not decide whether any particular installation in any particular

place is a barrier. That second question is a factual one for the entity, under rules this Department does not write. What a performance standard would supply is the technical input without which the second question cannot be reached at all.

1. A common technical referent for public entities

At present every entity answers the question for itself. Part VIII.E sets out the position: each state and municipal entity must independently research the same question, and in practice they reach for industry and trade guidance instead. A federal standard supplies one figure that is the same in every jurisdiction, written by the agency Congress assigned the question to.

The accessibility framework already works this way in the single place where it sets an optical number, and the Foundation points to it as the model rather than as a criticism. Part VIII.D.4 sets out the visible alarm provision, which states intensity in candela and flash rate in hertz. An entity applying that provision does not have to conduct photobiology. It reads a number and measures against it. Nothing comparable exists for any other optical emission a public entity operates.

2. Disclosure of emission characteristics at the point of procurement

The entity's decision is made when it buys. Part IX.F asks for disclosure, and directs part of that request to public entities conducting self-evaluations. A standard is what makes disclosure useful, because a disclosed figure is only informative against a criterion.

What would have to be disclosed is set out at Part III. Of the sixteen characteristics there, the ones a procuring entity needs are the spectral power distribution, the luminance of the emitting surface and the angle it subtends, and the temporal quantities at Part III.E. Part VI.G.2 records what the present position is for one product class: the governing characteristic exists on the component manufacturer's data sheet, is known to the maker, and is disclosed to nobody who meets the product.

3. Reduced duplication of research across jurisdictions

Part VIII.E sets out the duplicated cost. A standard set once by the agency holding the authority replaces the same inquiry repeated across thousands of entities, none of which employs a photobiologist.

The Foundation adds that the duplication is not merely wasteful, because waste is the weaker objection. Part VIII.E records that it produces inconsistent and conflicting determinations, which means that whether a person has access depends on which jurisdiction they are in. A federal criterion is the only instrument that reaches that, and reaching it is the ordinary purpose of a federal standard.

4. A basis on which accommodation requests can be evaluated consistently

Part VIII.F describes what happens now. The burden of establishing harm falls on the person requesting the accommodation, and Part VIII.F records the absence of a federal criterion being given as a basis for denial.

A standard would not decide any request, and the Foundation does not suggest it would. What it would change is what the requester has to establish. At present a person asking for a streetlight to be shielded is in effect asked to establish that light of that kind injures people, which is a question of science that no individual can answer and that Part V shows the federal government has not answered either. Against a criterion the question becomes whether this installation exceeds a stated figure, which is a question of measurement.

It would also change what a denial can rest on, and the Foundation states this as an even-handed consequence rather than as a benefit to requesters. Where an installation is within the criterion, an entity could say so and give a reason. Where it is not, the entity would know that too. Either way the determination would rest on something, which is what Part VIII.E describes as presently missing when the systemic duty defaults into the individualized one.

5. The two instruments this requires, and which body supplies each

The Foundation is asked, in substance, what standards should be established so that a person with a disability has full and equal access to public and private facilities and so that the path of travel is not obstructed by light. It answers that two instruments are required, that they are not the same instrument, and that they are not written by the same body. Saying so is what keeps this comment within the authority it relies on.

The first is an emission standard. It bounds what a product may emit, in the characteristics at Part III, and it is prescribed under § 360kk by this Department. Part IX.I sets out the one such standard the Foundation asks the Secretary to consider prescribing now, and the reasons the others must wait for the research at Part IX.C. This is the instrument the Foundation asks this Department for.

The second is an accessibility criterion. It states when an emission in a particular setting denies access, and it would have to be expressed by reference to the quantities the first instrument bounds. It is not within this Department's authority. The accessibility guidelines are the Access Board's and the Title II and Title III regulations are the Department of Justice's, and the Foundation asks nothing of this Department in respect of either beyond what paragraph 360ii(a)(6) already directs, which is that it consult and maintain liaison with them. Part IX.E.5 asks that an express invitation be sent.

The relationship between the two is the point, and it explains why the order matters. The second instrument cannot be written until the first exists, because an accessibility criterion expressed in a quantity nobody measures and against a threshold nobody has set would not be applicable by the entities bound by it. That is the condition the accessibility framework is in now as to every optical emission except the visible alarm, and Part VIII.D.4 shows that where the framework did set a number, it set the one the technology of the day made available and left the rest unbounded.

The Foundation therefore does not ask this Department to write an accessibility standard, and would object if it tried. It asks for the emission standard, the research that supports it, and the consultation that would let the bodies holding the accessibility authority write the second instrument against the first.

H. Scope Note: The Request Made and Not Made Here

This Part is not a request that the Department enforce or interpret another agency's regulation, and the comment should not be read as one. The Foundation states that expressly because the Part describes at length the duties that the Department of Justice administers, the guidelines the Access Board issues, and the provision the Equal Employment Opportunity Commission administers, and a reader could take the description for a request.

What the Part is offered as is two things. It is evidence of what the absence of a federal emission criterion costs, which Part VIII.E sets out and which bears on the questions this notice asks about the consequences of the present position. And it is a direct answer to the question what technical information should be disclosed to state and local governments, which Part VIII.G.2 and Part IX.F.2 answer.

The requests this comment makes are confined to what this Department can do under its own authority. Part IX states them, and nothing in this Part asks for more than Part IX asks.

IX. RECOMMENDATIONS

A. Confirm That Visible Light From LED Products Is Electronic Product Radiation

This is the only request in this Part that asks the Department to do nothing. It asks that something already true of the Department's conduct be stated. The Foundation places it first because every request that follows depends on the answer, and because a premise that an agency acts upon but never states can be withdrawn later without ever having been decided. Part II.B sets out the definitional case from the text of 21 U.S.C. § 360hh. This subsection sets out what the Department has already done.

1. The product code the Center has already assigned to these products

The Center for Devices and Radiological Health maintains a classification database of radiation-emitting electronic products. For each product class it records a product code, a definition, the type of radiation, the reports required and the performance standards that apply. One of those classes is product code RHH. The Foundation reproduces the entry field by field, in the database's own words and capitalization.

Product. led lamps emitting visible light intended to be used for illumination purposes

Definition. LED lamps emitting predominantly visible and/or white light intended to be used for illumination purposes. These include illumination products, flashlights, finished bulbs or lamps.

Product Description. General Optical Products / Non-Medical

Radiation Type. Optical

Radiation Safety Report Type Required? None

Annual Reports Required? No

Applicable Performance Standard(s). No standard applicable. General Radiological Health requirements apply. [1000-1005]

Published at https://www.accessdata.fda.gov/scripts/cdrh/cfdocs/cfPCD_RH/classification.cfm?PCD=RHH, the page recording that it was last updated on September 28, 2026 and accessed on October 16, 2026.

Three things follow, and the Foundation separates them. The first is about the character of the emission, and it is the only one of the three that concerns this subsection directly. A light-emitting diode lamp emitting visible light for illumination is, on the Center's own classification, a product whose radiation type is optical and to which the general radiological health requirements apply. The character of an emission does not change with the housing around it. The visible light emitted by an indicator on a washing machine, by a video display, by a dynamic message sign and by a flashing warning beacon is the same optical radiation, emitted from the same class of emitter, and it is electronic product radiation for the same reason.

The second is a limit on what the entry proves, and the Foundation states it before the Department does. Product code RHH covers one product class: finished bulbs and lamps for illumination. That is one of the thirteen classes set out at Part VI, and it is not the class about which this comment says the most. Paragraph 360hh(1)(A) defines electronic product radiation by the physics and the source and not by a classification code, and a code assigned to one class is not a determination that any other class falls outside the definition. The Foundation relies on the entry for what the Center said about the emission, and not for the reach of the statute.

The third is the Foundation's own, and it runs the other way, though not in the direction the Foundation first supposed. The Center has not confined itself to the lamp in a room. It has assigned five product codes to light-emitting diode products and three more to displays, and it has recorded against every one of them that no performance standard applies. The census is set out at

Appendix F.1 and the consequence is drawn at Part II.B.6. What is missing from the classification is not the indicator or the display, which are there. It is the roadway: no code reaches a diode headlamp, a diode warning beacon, a diode roadway luminaire, a pedestrian crossing beacon or an outdoor message sign, while the laser equivalents of two of those carry a performance standard and an annual reporting obligation today. The Foundation does not say that the shape of the classification is a legal limit. It says that the shape is an instance of the under-administration this comment alleges throughout, and that the entry at RHH is evidence of that and not against it.

Second, the Center classified the emission. The radiation type is recorded as Optical, and the entry states that the general radiological health requirements at parts 1000 to 1005 apply. That is the agency's own characterization of the visible light emitted by a light-emitting diode lamp as radiation, recorded in the database the agency maintains for radiation-emitting electronic products, and it is the proposition this subsection asks to have stated.

Third, and the Foundation asks the Department to read this field twice: against a product class the Center has defined, and whose radiation type the Center has classified, the Center has recorded that no performance standard applies. That is the premise of Part IX.I, written by the agency. The Foundation is not asking the Department to assert an authority it has disclaimed. It is asking the Department to fill in a blank the Department has already printed.

2. What the agency says it regulates when these products are imported

The agency's guidance on importing radiation-emitting electronic products defines such a product as any electrically powered product that can emit any form of radiation on the electromagnetic spectrum, and lists among the non-medical products so regulated liquid crystal displays and light-emitting diodes. It identifies the governing provisions as sections 532 to 538 of the Federal Food, Drug, and Cosmetic Act, which are the provisions codified at 21 U.S.C. §§ 360hh to 360ss and relied on throughout this comment. Published at https://www.fda.gov/industry/importing-fda-regulated-products/importing-radiation-emitting-electronic-products, accessed October 16, 2026.

3. The instruction given to the trade in 2017

On June 6, 2017 United States Customs and Border Protection published a message to the trade, numbered CSMS 17-000330 and headed Light-Emitting Diode (LED) Reporting to FDA, relaying an update from the Food and Drug Administration. The sentence the Foundation relies on is this one: "LED products emit visible optical radiation, which qualifies them to be radiation-emitting electronic products." The message went on to state that entry data was expected for light-emitting diodes used for general or local area illumination, such as lamps and lightbulbs, under a stated tariff heading, and was not expected for finished products using light-emitting diodes only as indicator lights, such as toys, telephones, appliances and remote controls. Published at https://content.govdelivery.com/accounts/USDHSCBP/bulletins/1a00f8a, accessed October 16, 2026.

Two features of that instruction bear on this comment, and one misreading of it has to be closed off at once. The instruction was operative rather than advisory: it told importers what the agency expected to receive, and the expectation rested on the characterization of visible optical radiation as electronic product radiation. And it drew its line in 2017, which places the agency's position on the character of this emission seven years before the determination of May 24, 2024.

The misreading is this. The message excused importers from submitting entry data for products using light-emitting diodes only as indicator lights. That is an instruction about what data the agency wished to receive at the border. It is not a determination that an indicator lamp is outside 21 U.S.C. § 360hh(1)(A), and nothing in the message says that it is. The Foundation is particular about this because the distinction between illumination and indication is not a distinction this comment adopts. Part VI.G treats indicators on appliances, chargers, smoke alarms, routers and televisions at length and identifies the characteristic that governs them; Part V.C.2.k records that single indicator diodes are, on a testing laboratory's own account, typically not evaluated under

the present standards at all; and Part IX.J asks that an indicator lamp on a household appliance be capable of being dimmed or extinguished by the user. An administrative convenience adopted at the border should not be read back into the statute as a jurisdictional line, and the Foundation asks the Department not to read it that way.

4. The determination of May 24, 2024 reached the merits

An agency that lacks authority over a subject disposes of a petition about it on that ground, which is the cheapest disposition available and requires no evidence. The Final Response of May 24, 2024 did not do that. It engaged an organization to conduct a literature search and systematic review, weighed the evidence, and reached a conclusion about health effects. An agency that reaches the merits has necessarily decided that the subject is within its authority, because otherwise the merits were none of its business. Parts I.C.6 and II.F set out the response and what it rests on; what this subsection takes from it is narrower, and it is about conduct rather than reasoning.

5. The one public page on which the Department mentions these products, and what it tells a reader to do next

The four records above are internal or technical. A classification database entry, a guidance document for importers, a message to customs brokers, and the response to a petition are each addressed to somebody who already knows what to look for. This record is different. It is a page on this Department's public site, addressed to the general reader, and it is the only page on that site the Foundation has found which mentions light-emitting diodes at all.

The page is headed Laser Products and Instruments, is published by the Center for Devices and Radiological Health, and states that its content is current as of November 13, 2024. Under its description of what a laser is, it says this:

> LEDs (Light Emitting Diodes) are different from laser diodes and are not subject to the Federal laser product performance standard.

The sentence that follows it uses an ordinary light bulb as its example of a source of visible light, so the product class is in view in the next line as well.

a. Two things that sentence establishes, and the Foundation takes both

The first is that it is an affirmative act of distinguishing rather than an omission. Somebody at the Center thought it necessary to tell the reader that these products are not within the laser standard, and a distinction is only drawn where it might otherwise be missed. The sentence therefore presupposes a reader who might suppose the laser standard reached a light-emitting diode, and it answers that reader. That is this Department treating light-emitting diodes as a product class lying within the field its own program occupies, which is the proposition this Part asks it to state.

The second is that the exclusion the sentence states is an exclusion from one performance standard and not from the Act. The page establishes that itself, without saying it. Among the authorities the page sets out for the reader are the electronic product radiation control subchapter of the Federal Food, Drug, and Cosmetic Act, including 21 U.S.C. § 360ii, and parts 1000, 1002, 1003, 1004, 1005 and 1010 of title 21 of the Code of Federal Regulations together with §§ 1040.10, 1040.11 and 1010.4. The sentence excludes these products from § 1040.10. It does not exclude them from the general provisions of part 1000, from the records and reports of part 1002, from the notification of defects under part 1003, from the repurchase and repair obligations of part 1004, or from the importation provisions of part 1005.

And this Department has already said exactly that, in the record reproduced at subsection 1. The classification entry for these products records, in the field for applicable performance standards: "No standard applicable. General Radiological Health requirements apply. [1000-1005]". Two records of this Department, reached by different routes and addressed to different readers, state

the same position. There is no standard for these products. The general requirements apply to them. The Foundation asks the Department to notice that it has twice said so.

b. What the page does not do, which is why the Foundation sets it out

Having told the reader that these products are different from laser diodes and outside the laser standard, the page says nothing further about them. It does not state that they are electronic products within 21 U.S.C. § 360hh(1)(A). It does not state that the general provisions apply to them, although the same Department's classification entry does. It does not identify any standard, guidance document, classification record, program page or office to which a reader with a question about a light-emitting diode product should go. The Foundation has examined the references the page offers and every one of them concerns lasers, laser light shows, laser notices, laser product reports, laser compliance and laser variances, or else the general pages on importing, market entry and reporting which apply to electronic products as a class and say nothing about this one. The page mentions light-emitting diodes once, to say what does not apply to them, and stops.

The Foundation states the consequence as the reason for the request rather than as an accusation. A person injured by one of these products, or manufacturing one, or buying one for a workplace or a school, who goes to this Department's site to find out what the position is, finds one sentence about light-emitting diodes. The sentence tells them what does not apply. Nothing on the page tells them what does. The natural reading of a page which distinguishes a product from a regulated class and then falls silent is that the product is not regulated, and that reading is wrong: the same Department has classified the product, assigned it a code, characterized its emission as optical, told the importing trade that it qualifies as a radiation-emitting electronic product, and recorded that the general radiological health requirements apply to it. Subsections 1 through 3.

That is why the statement this Part asks for has to be made in terms. Part VII records the reports of harm transmitted to this Department by people who had concluded that somebody was responsible. This page is the clearest demonstration the Foundation has found of how hard that conclusion is to reach from the Department's own public material, because the Department has already published the half of the position which is a negative and has not published the other half anywhere a reader would look.

c. The limits of the point

A web page is not a regulation. The Foundation does not suggest that this page misstates the law, because it does not: the sentence is accurate, and light-emitting diodes are indeed not subject to § 1040.10. The Foundation does not suggest that the silence which follows the sentence was deliberate, and nothing in its argument turns on whether it was. It does not contend that this Department is obliged to maintain a web page about any particular product class; the provision which did compel a recurring public account of this program was § 360qq, and it was repealed in 1998, which Part II.I sets out. What the Foundation contends is narrower. Paragraph 360ii(a)(1) directs the Secretary not only to develop performance standards but to administer them, Part II.C treats that verb, and a program being administered can be expected, where it addresses a product class in public at all, to tell the reader where to look next.

6. What the Foundation asks, and four things it does not claim

The Foundation asks the Department to state, in terms: that visible light emitted by light-emitting diode products is electronic product radiation within 21 U.S.C. § 360hh(1)(A); that such products are electronic products within § 360hh(2); and which of the duties imposed by § 360ii(a) the Department understands to attach in consequence. The third limb is the operative one. A confirmation that stops at the definition concedes the premise and leaves the duties unaddressed, and the requests at subsections C, D and E of this Part are the duties in question.

Four things the Foundation does not claim, stated here so that the request is not read for more than it is. A product code is an administrative classification and not a rule; it binds nobody and is not a determination under any provision of the Act. The entry recording that no performance

standard applies is a statement about the standards that exist, not a concession that one is required; the case for requiring one is made at Part IX.I and does not rest on this entry. The Customs message is a Customs document relaying the agency's position, and the Foundation does not describe it as an agency letter. And a classification made for import and reporting purposes does not by itself determine which duties under § 360ii attach, which is precisely the question this subsection asks the Department to answer.

What remains after those qualifications is simple, and the Foundation states it in one sentence. The Department is asked to say what its own classification database, its own guidance to importers, its own instruction to the trade and its own disposition of two citizen petitions have each already assumed.

B. Publish the Evidentiary Basis for the May 24, 2024 Determination

1. Identify the independent third-party organization engaged to conduct the literature search and systematic review

The Foundation asks that the organization be identified by name. The determination of May 24, 2024 attributes a review of the literature to an independent third party, and the Foundation has not been able to establish who that was.

The request is for four facts and none of them concerns the science: the identity of the organization, the instrument under which it was engaged, the scope of what it was asked to do, and whether its report exists as a document. Part IV.I.6 records that the agency's records on this subject remain unavailable to the public, and Part IV.D sets out the requests by which Mr. Baker, individually, has sought agency records.

The reason the identity matters is stated plainly and is not an insinuation. A determination that rests on a review by an unnamed body cannot be assessed by anybody outside the agency, and a commenter asked to respond to it is asked to respond to a conclusion whose basis is withheld. The Foundation makes no allegation about the organization, whose competence it has no reason to doubt and no means of assessing.

2. Publish the literature search and systematic review

The Foundation asks that the search be published: the databases queried, the search terms, the date range, the inclusion and exclusion criteria, the number of records retrieved and the number retained. That is the ordinary minimum for a systematic review and it is what allows a review to be checked rather than accepted.

Part V.A.1 sets out the Foundation's own search strategy and Part V.A.2 the categories of evidence and how each is weighted, and the Foundation records that it published those so that the Department could test its appraisal rather than take it on trust. It asks for the same courtesy in return, and notes that the comparison is not a rhetorical one: Appendix C sets out the Foundation's appraisal of each study it relies on, entry by entry, with what each establishes and what it does not.

If no systematic search was conducted, the Foundation asks that this be stated. A determination founded on a narrative review rather than a systematic one is not thereby wrong, and the Foundation does not suggest it is. But a reader cannot tell which was done, and the difference bears on how much weight the conclusion carries.

3. Publish the criteria by which the evidence then before the agency was judged insufficient

The Foundation asks that the criteria be published: how the evidence then before the agency was weighted, what counted as sufficient to establish an effect, what counted as sufficient to exclude one, and how the two thresholds related to each other.

The last of those is the one the Foundation asks the Department to address directly. A finding that an effect has not been established and a finding that an effect does not occur are different findings

resting on different evidentiary thresholds, and Part V.A.3 sets out how this comment distinguishes what is established, what is emerging and what is unresolved. Part IX.B.4 concerns the particular finding of a long history of safety, and Part VII.J.1 sets out why an absence of recorded injury, where no surveillance exists, is not evidence of an absence of harm.

The Foundation asks for the criteria rather than for a different conclusion. If the criteria are published and the conclusion follows from them, the Foundation will have learned something it does not now know, and so will every other commenter.

4. State the basis for the finding of a long history of safety with respect to the visible wavelengths emitted

The Foundation asks the Department to state the basis of that finding, and identifies the three particulars that would make the statement responsive.

First, the emission characteristics against which safety was assessed, and the levels. The finding is expressed with respect to the visible wavelengths being emitted. The Foundation asks which measured quantity was compared against which limit: radiance, irradiance, luminance, spectral distribution, or some combination, and in each case the numerical value below which the agency regards a product of this class as presenting no risk of the effects described in Part V. If no such value has been established for any of those quantities, the Foundation asks the Department to say so, because that answer is as responsive as a number and is the answer the Foundation expects.

Second, the products the history covers. Part I.C.7 asks what the history is a history of. The Foundation asks the Department to identify the period and the product types the finding draws on, and to state whether it extends to the high-radiance, narrow-peak, modulated and multi-emitter products described at Part V.B, which postdate most of any period the phrase could denote.

Third, the spectral question specifically, because the finding is framed in spectral terms. The Foundation asks the Department to state whether it regards the spectral power distribution of a visible-light emitter as bearing on the safety of that emitter; if so, what spectral criterion it applies; and if it applies none, how a finding expressed with respect to the wavelengths emitted was reached without one. Part V.B.3 and Appendix C.70 set out the evidence that the biological response depends on this quantity at matched photometric output and at matched correlated color temperature.

The Foundation repeats here what it states at Part I.C.7. It does not ask the Department to find these products unsafe. It asks the Department to identify the level, and if no level has been identified, to undertake the study by which one could be.

5. Reconsider the determination against the record assembled in Parts V and VII

The Foundation asks that the determination of May 24, 2024 be reconsidered against the record assembled in this comment, and frames the request as reconsideration in light of new material rather than as a challenge to the earlier decision.

The framing is deliberate and the reason for it is practical. The 593 accounts at Appendix A postdate the determination, as does much of the literature appraised at Part V and Appendix C. An agency may revisit a determination on a changed record without conceding that the original was wrong, and the Foundation wishes to leave that route open rather than to close it by insisting on error. Part I.C.10 sets out what the Foundation asks this Department to accept and what it does not.

C. Undertake the Research Required by § 360ii(a)(2), (4), and (5) [RFI Q5.o, Q16]

1. Express emission and exposure radiometrically

This is the specific methodological request on which the rest of Part IX.C depends. Any study the Department undertakes, and any measurement protocol it adopts, should report spectral power distribution, radiance, irradiance and power density, with photometric quantities given in addition rather than instead.

Three reasons, each established elsewhere in this comment. Photometric units are weighted by a brightness function that discounts the short-wavelength region at issue, which Part I.G and Part V.J.4 set out. The responses under study do not follow that function, which Part V.L.3 sets out. And radiometric reporting makes optical exposure data directly comparable with the radiofrequency exposure data this Department is gathering under this notice, which Part V.J.5 sets out and which is the one request in this Part that costs the Department nothing but a choice of units.

2. Characterize source geometry and apparent source size

The Foundation asks that the characterization record the geometry of the source and not only the quantity it emits. Part V.B.2 sets out why: these products concentrate their output into emitting areas far smaller than those of the sources they replaced, so a product of identical luminous flux presents a different stimulus to the eye.

The quantities asked for are the luminance of the emitting surface, the apparent source size at the distances at which people actually meet the product, and the uniformity of the emission across the surface. The third matters because a luminaire presenting an array of discrete points behaves differently from one presenting a diffused surface of the same average luminance, and Part III.G.1 treats shielding and diffusion as techniques of minimization for that reason.

Apparent source size is the quantity that connects this request to the exposure limits already in use. Part V.C.2 sets out the blue light hazard assessment, in which the angular subtense of the source determines which limit applies and therefore whether a product is treated as a small source or an extended one. A characterization that omitted the geometry would not permit the existing framework to be applied to these products at all.

3. Resolve temporal modulation rather than integrating it away

The Foundation asks that the characterization resolve the time course of the emission rather than report its average. The distinction is not a refinement. An instrument that integrates over a period long compared with the modulation returns the mean illuminance and discards the entire characteristic, and Part V.D establishes that the characteristic discarded is the one associated with the responses at Part V.D.2 and Part V.E.1.

Four quantities are asked for: the modulation depth, the fundamental frequency, the duty cycle, and the rise and decay times of each transition. Part III.E.2 treats the last of these as a characteristic requiring a boundary and records that the Foundation has located no federal specification of it anywhere, and Part IX.I.2 sets out why temporal light modulation is different from every other characteristic in the way it would have to be regulated.

One further resolution is asked for and it is not presently measured by anyone. Part VI.H sets out that a display can hold total luminance constant while modulating strongly in color, because its color channels modulate against one another, and that none of the temporal quantities in ordinary use is computed per wavelength channel. The Foundation asks that the characterization of products in that class resolve modulation per channel. It asserts no effect of channel modulation and relies on no study of it; it asks that the quantity be measured, because a quantity nobody measures cannot be the subject of a finding either way.

4. Adopt the weighting functions appropriate to each response studied

Photochemical retinal injury, melanopsin-mediated circadian effect and visual discomfort each have their own wavelength dependence. A study should state which weighting it applies and why.

And it should preserve the unweighted spectral data, which is the part of this request the Foundation asks the Department to notice particularly. A weighting discards information irreversibly. Data reported as a weighted quantity cannot be reweighted when a better action spectrum becomes available, and Part V.L.3 establishes that for most of the responses this comment concerns no agreed weighting exists yet. Preserving the spectrum costs nothing at the time of measurement and is the difference between data that remains useful and data that does not.

5. Study the product classes identified in Part VI

Part VI identifies the product classes in the exposure environment. The Foundation asks that the study and evaluation directed by paragraph 360ii(a)(4) reach them, and offers a priority order, because a request to study twenty classes at once is a request that will not be acted on.

The order the Foundation proposes follows the principle Part VI.A states, which is the conditions of the encounter rather than the number of units deployed. First, the classes a person meets involuntarily in the public way and cannot decline: motor vehicle lighting at Part VI.B, the emergency and warning lamps at Part VI.C, and roadway and area lighting at Part VI.D. Second, the classes where presence is compulsory and the exposed person is among those Part IX.L asks be addressed expressly: school, workplace and healthcare interiors at Part VI.E, and the school bus lamp at Part VI.C.3. Third, the remainder.

The Foundation states the basis of that ordering and its limits. It rests on voluntariness and duration rather than on evidence of harm, because Part VIII.D establishes that no measure of harm by class exists to order them by. It is therefore a proposal about where to begin and not a ranking of risk, and the Foundation would not defend it as the latter. Part VI.B is first on it for an additional reason that does not depend on the ordering at all: Part VI.B records that it is the only class for which a federal standard already sets numerical limits on emission, so it is the class in which a characterization would have an existing instrument to inform.

6. Study the populations identified in Part V, and in particular the one for which no adequate study exists

The requests at subsections 1 through 5 concern how a study should be conducted and which products it should cover. This one concerns who should be in it, and the Foundation makes it separately because a study can satisfy every methodological request above and still not answer the question for the people most affected.

Part V.E.3 sets out the position for autistic people and the Foundation does not repeat it here. In summary: atypical reactivity to sensory input is part of the diagnostic construct; the two most relevant studies the Foundation could identify are set out at Appendix C.82 and Appendix C.83; the first measures the response to light but included no autistic participants; the second has eighty-seven diagnosed autistic children but measures nothing and reports no photometric or radiometric quantity whatever; and the Foundation is aware of no study that holds a diagnosed population, a measurement, and a characterized exposure at the same time.

The Foundation asks the Department, under paragraph (a)(4), to undertake or commission a study with the following three features held together, since the deficiency in the existing literature is that no study holds all three:

Participants identified by clinical diagnosis rather than by trait questionnaire administered to a population without the condition.

An outcome that is measured rather than reported, whether physiological, such as the pupillary light reflex with its latency and amplitude in absolute units and with redilation included, or behavioral and observed.

An exposure characterized in the terms subsection 1 requires, namely spectral power distribution, radiance, irradiance and power density, with the temporal structure resolved as subsection 3 requires rather than integrated away, and with the conditions of darkness and of repeated flashing included among those tested, because Part V.E.3 establishes that the repeated-exposure condition has been excluded by the design of the studies that exist.

The Foundation states the limits of this request. It does not ask the Department to presume an effect, and Part V.E.3 declines to assert one. It does not ask for a study of autism, which is not this Department's subject under this chapter and is the subject of other components of it. What it asks is that where a population is defined in part by its reactivity to sensory input, and where the products described in Part VI emit the sensory input in question, the study that paragraph (a)(4) directs should include that population and should characterize what it is exposed to. Neither has occurred.

The same request applies, with the same reasoning and without separate elaboration, to the populations identified at Part V.E.1, Part V.E.2 and Part V.C.2.g, namely persons with photosensitive epilepsy, persons with migraine and photophobia, and children, whose ocular transmittance at the short wavelengths is higher than that of the adults from whom the exposure limits were derived.

D. Establish Adverse Event Reporting and Surveillance for Optical Radiation [RFI Q10]

Part VII.J establishes that no federal system directed at optical radiation collects reports of adverse reaction to it, and states the Center's own position that a channel for consumer reports already exists. This subsection asks for what a channel is not. The Foundation renews the request it made to a component of this Department on March 3, 2023 and sets out what it does and does not ask for.

The distinction the request turns on

A channel receives whatever arrives. A surveillance system is built to answer a question, and Part VII.J.1 sets out the four things it needs that a channel does not have. A case definition, so that it is known what is being counted. A denominator, so that a count becomes a rate. A capacity to follow up, standardize and verify. And a published output, so that what was received can be seen. The Foundation used the channel: Part IV.B records the transmittal of the reports now at Appendix A to the Center's radiological health route between 2022 and 2026. What followed is the subject of Part IV.I.

What such a system would have to record

More than a symptom. A system that records only what a person experienced can establish nothing about the emission that produced it, and the Foundation's own database has exactly that defect, which Part VII.A.5 concedes. The additional fields are not elaborate: the location, the installation or product complained of, the product class in the terms of Part VI, and whichever of the characteristics at Part III the reporter or an inspector can supply. With location and installation recorded, the geographic question at Part VII.J.2 becomes askable. Without them it does not.

Four routes that already exist, requiring no new authority

The Foundation identifies them because the objection to this request is likely to be that it requires something new, and it does not.

Manufacturer reporting of accidental radiation occurrences. The Foundation asks the Department to determine whether the reports described at Part VII are accidental radiation occurrences within 21 C.F.R. § 1000.3(a), and therefore reportable by manufacturers under § 1002.20. That

determination requires no rulemaking. If the answer is yes, a reporting obligation already attaches and has not been observed. If the answer is no, the Foundation asks that the reason be stated, because the reason will be informative either way.

The Center's consumer route. Part VII.J.1 sets out the Center's statement of May 23, 2019 that it already has a means for consumers to submit reports. The Foundation asks that this route be published in terms that name optical radiation from light-emitting diode products, so that a person who has such a report can find it, and that what it has received be stated.

The Centers for Disease Control and Prevention. Part VII.J.1 sets out the request of March 3, 2023 and its disposition. Part IX.E.3 asks for the internal liaison that would carry it.

Occupational reporting. Part VII.J.3 sets out the occupational position and the health hazard evaluation capability that sits within this Department.

The impracticability objection, answered by an existing federal system

If it is said that incident surveillance of this kind cannot practically be built for a hazard distributed across millions of installations and reported by members of the public, the answer is that the federal government operates such a system for fire. Part II.H.21 sets out the comparison. The Foundation does not suggest the two subjects are alike in their science. It observes that the architecture exists, that it was built for voluntary reporting of incidents by many thousands of local bodies, and that its existence disposes of the argument from impracticability.

And the States, which the Department can simply ask

Part II.H.13 asks the Department to ask rather than to assume, and the Foundation repeats the suggestion here as part of this request. Begin with the States operating approved occupational safety and health plans, and with the consumer protection offices of the most populous States. Each holds complaint records. A survey of what they hold is not a surveillance system, but it is obtainable now, by correspondence, and it would establish whether the subject appears in records the federal government has never looked at.

What the Foundation does not ask

It does not ask the Department to adopt the Foundation's form, its condition categories, or its data. It does not ask that its reports be treated as verified. Part VII.A.5 and Part VII.J.1 set out why its database has the defects it has, and every one of them follows from who is doing the collecting rather than from the subject matter.

One consequence of granting this request deserves stating, because it cuts against the Foundation and the Foundation would rather state it than have it pointed out. If the Department establishes a system and the system receives very little, that is a finding, and it is a finding adverse to this comment. The Foundation accepts that risk and asks for the system anyway, because a Department that has established no surveillance cannot read its own empty files as a safety record, and Part IX.B addresses the use that has been made of silence.

E. Exercise the Interagency Liaison Duty of § 360ii(a)(3) and (a)(6) [RFI Q17]

1. Food and Drug Administration [RFI Q17.a]

The notice asks about coordination with the Food and Drug Administration. For this subject matter that question is not a question about coordination between two bodies, and the Foundation sets out why in three steps the Department can verify from the statute.

First, the duty is the Secretary's. Section 360ii(a) directs that the Secretary shall establish and carry out an electronic product radiation control program, and each of the six paragraphs beneath it directs what the Secretary shall do. Part II.A sets out the framework. The statute does not name the

Food and Drug Administration and does not name the Center for Devices and Radiological Health. The authority sits with the Secretary and reaches those components by delegation within the Department.

Second, this notice was issued by an office of the Secretary. The question put to the public in it, so far as it concerns coordination with the Food and Drug Administration, is therefore a question the Department is asking about the exercise of the Department's own duty by the Department's own component.

Third, that makes the office issuing this notice able to do something the Foundation cannot do and the Center is unlikely to do unprompted. It can put the question internally. It is not a petitioner, it is not bound by the position taken in the Final Response of May 24, 2024, and a question asked from within the Department requires the Center to concede nothing in order to answer it.

What the Foundation asks

Four things, none of which requires the agreement of anybody outside this Department. That this comment and the record at Part VII be transmitted to the Center for Devices and Radiological Health. That the Center be asked to state whether it carries out a program directed at the light-emitting diode products that account for most human exposure to artificial optical radiation, and if so to identify it. That the Center be asked the questions at Part IX.B concerning the evidentiary basis of the determination of May 24, 2024. And that whatever the Center answers be recorded on the docket of this proceeding, so that the answer exists in a public document whichever way it goes.

The Foundation asks for none of the following and says so expressly. It does not ask this office to overrule the Center, to direct a scientific conclusion, to reassign the delegation, or to find that any duty has been breached. Part I.C.9 explains why the Foundation's attention is on the duties rather than on the conclusions. The request here is that the question be put and the answer written down.

2. National Institutes of Health [RFI Q17.b]

The notice asks about coordination with the National Institutes of Health. The Foundation's answer begins with a concession, because the obvious version of this answer is wrong.

It would be convenient to say that this Department funds no research on the subject. That is not true and the Foundation does not say it. Part V.E.1 records work by investigators funded by the National Institute of Neurological Disorders and Stroke on light sensitivity and its mechanisms, and Part V cites published research in areas within the remit of more than one institute. The Foundation has not surveyed the research portfolio of this Department and makes no claim about its extent.

The gap is of a different kind and it is the gap this comment is about throughout. Research into a mechanism is not the same thing as the study and evaluation that paragraph 360ii(a)(4) directs, which is a study of the emission of a product and of the conditions of exposure to it, conducted for the purpose of determining what may be minimized. Part II.F sets out that paragraph and the absence of any such study. Funded investigators establishing how light reaches the trigeminal system in migraine are answering a question about physiology. Nobody is answering the question of what the luminaire outside the window emits and at what level it affects the person inside, and no quantity of the first kind of research produces an answer to the second unless someone asks for it in those terms.

The institutes whose remit the questions fall within

Part IX.C sets out the research the Foundation asks for. Its questions divide, by subject matter, across institutes of this Department: retinal and ocular effects, which is the remit of the National Eye Institute; photosensitive epilepsy, migraine and photophobia, which fall within the National Institute of Neurological Disorders and Stroke; and environmental exposure and its health effects, which fall within the National Institute of Environmental Health Sciences. The Foundation names those three because the correspondence is evident, not because it has established that any of them regards the subject as within its priorities.

What the Foundation asks

Three things. That the Department state what research into optical radiation emitted by light-emitting diode products it has funded, through which institutes and over what period, which is a question the Department can answer from its own records. That the research questions set out at Part IX.C be put to the institutes named above in the terms paragraph 360ii(a)(4) uses, which are the emission and the conditions of exposure, rather than in the terms in which mechanism research is ordinarily framed. And that the Center for Devices and Radiological Health and those institutes be connected, which is liaison within a single Department and is the easiest instance of the duty at Part IX.E.5 to perform, because it requires an invitation from nobody outside this building.

The Foundation asks for no particular finding and takes no position on how any such research would come out. Part IX.C.6 sets out what it asks be studied and Part IX.L sets out the populations it asks be addressed expressly.

3. Centers for Disease Control and Prevention [RFI Q17.c]

The request made to this component on March 3, 2023, and its disposition, are set out at Part VII.J.1. The Foundation renews it here and asks that the surveillance described at Part IX.D be established.

The liaison asked for in this subsection is internal to the Department, which distinguishes it from the requests at subsection 4 and makes it the least burdensome of them. It requires an invitation from nobody outside this Department and the agreement of no other agency.

4. Agencies outside the Department

The Foundation asks the Department to exercise the liaison duty of § 360ii(a)(3) and (a)(6) with the agencies identified at Part II.E and Part II.H, and to state on the record, as to each, whether consultation concerning visible light emitted by LED products has occurred and with what result.

a. A first time-limited request, and the proceeding that is open now

One of those requests is time-limited and the Foundation sets it out separately for that reason. The Department of Transportation announced on October 6, 2026 a negotiated rulemaking to modernize Federal Motor Vehicle Safety Standard No. 108, docketed as NHTSA-2026-1981, with applications and comments due November 9, 2026 and headlamp glare among the announced subjects. Part II.H.5. The Foundation asks the Department to communicate with the Department of Transportation concerning that proceeding, to offer whatever it holds bearing on the health effects of the emissions at issue, and to state whether it has done so. The request is made now because the proceeding is open now, and because the pattern described at Part IV.G — a federal rulemaking determining the optical characteristics of a product class without the participation of the agency holding the radiation-health authority — is in this instance still capable of being avoided rather than merely described.

Specifically, the Foundation asks the Department to do four things, the first three of which require the agreement of no one:

consult and maintain liaison with the National Highway Traffic Safety Administration concerning the proceeding, under § 360ii(a)(3) and (a)(6)(A), the latter of which names techniques, equipment and programs for testing and evaluating electronic product radiation as a subject of consultation and the proceeding having announced test procedures as a subject of negotiation;

file in Docket No. NHTSA-2026-1981 by November 9, 2026 whatever the Department holds bearing on the health effects of the emissions at issue, including the reports described at Part VII;

state on the record of this proceeding whether any communication between the two Departments concerning vehicle lighting has occurred, and when;

and seek whatever participation in the negotiating committee the Department of Transportation and the committee's charter permit, the Foundation asserting no entitlement to it.

b. A second time-limited request, and this window closes first

On September 17, 2026 the Office of Engineering and Technology of the Federal Communications Commission released Public Notice DA 26-997 in ET Docket No. 13-84, summarized at 91 Fed. Reg. 60,128 (Sept. 22, 2026), seeking comment on the radiofrequency exposure issues remanded to that Commission in Environmental Health Trust v. Federal Communications Commission, 9 F.4th 893 (D.C. Cir. 2021). Comments are due October 22, 2026, which is the day after the comment period in this proceeding closes. Part II.H.8.

Two features distinguish this request from the one above and the Foundation states both, because they cut in different directions. The first is that the subject of that docket is radiofrequency energy and not visible light. The Foundation accordingly does not suggest that optical material belongs in it, does not ask this Department to take any position there on the optical question raised in this comment, and does not ask it to take any position on the radiofrequency science. The second is that the Commission has invited participation in terms that name this category of participant: it invites, among others, "local, state, federal, and international health and safety agencies". So the occasion was created by the other agency rather than by this one, it is addressed to agencies of exactly this kind, and it is open as this comment is filed.

The Foundation asks the Department to do three things, none of which requires the agreement of anyone:

state on the record of this proceeding whether any communication between this Department and that Commission concerning the matters remanded in Environmental Health Trust has occurred since the correspondence of April 24, 2019, and if so to produce it;

determine, before October 22, 2026, whether to participate in ET Docket No. 13-84, and state what it decides and on what ground, a stated reason being useful to this record whichever way the decision goes;

and state whether the assessment conveyed to that Commission on April 24, 2019 remains the position of this Department, which Part IX.B asks in another form and which Part II.H.20 sets out at length.

One observation is added and confined. The notice states that probative value will be accorded to submissions able to overcome "the failings that the court identified when the Commission last attempted to rely on the expertise of expert agencies", and Part II.H.8 sets out why that sentence describes the correspondence of April 24, 2019. The Foundation does not ask this Department to accept that characterization, which is the Commission's and not the Foundation's. It asks the Department to notice that the agency which received the one documented consultation in this program's history has described the episode in those terms, in a document published a month before this comment, and has reopened the record in the same document.

c. A third agency outside the Department, which has already written a standard for the same products

The Foundation asks for one further consultation, and sets out the reason at the length it deserves because the Department can verify every element of it without leaving the Federal Register.

The Consumer Product Safety Commission enforces a mandatory safety standard for toys. Section 106 of the Consumer Product Safety Improvement Act, 15 U.S.C. § 2056b, made the ASTM toy safety standard a consumer product safety standard, and the current edition is incorporated by reference at 16 C.F.R. § 1250.2(a). That standard limits the sound a toy may emit, by a numerical criterion measured at a prescribed distance by a prescribed method, for the stated purpose of reducing the risk of hearing loss. It contains no limit on what a toy may emit as light. Part VI.M.

This Department has classified the same product. Product code RIO is assigned to light-emitting diode toys, the radiation type recorded against it is optical, and no performance standard applies. Appendix F.1.14.

So two federal agencies have looked at the same object. One has limited the energy it may deliver to a child's ear. The other has recorded that it emits radiation, assigned it a code, and limited nothing. The Foundation does not suggest that the Commission has failed in any duty; sound is within its authority and electronic product radiation is within this Department's. It asks the Department to do what § 360ii(a)(3) directs, which is to consult and maintain liaison with other agencies having related functions, and to state on the record of this proceeding whether any consultation with the Commission concerning optical emission from toys or from other products intended for children has ever occurred.

The Foundation asks three things specifically. That the Department state whether such consultation has occurred and when. That it consult the Commission as to whether an optical emission requirement for products intended for children should be addressed under 15 U.S.C. § 2056b, under § 360kk, or under both. And that it place before the Commission the market surveillance results at Appendix C.59 and the opinion at Appendix D.1.18, which bear on a product class the Commission regulates and which the Foundation has no reason to believe the Commission has seen.

5. Send an express written invitation to consult to each agency, and state which were sent

a. Why the invitation is the operative act, and why only this Department can make it

Paragraph 360ii(a)(6) directs this Department to consult and maintain liaison. The duty is this Department's, and Part II.H.10 establishes the direction in which it runs: neither the Occupational Safety and Health Administration nor the National Institute for Occupational Safety and Health bears any duty under this chapter, because the obligations of this part of title 21 fall on the Secretary of Health and Human Services.

The consequence is the one Part II.H.10 draws, and it is the premise of this request: of the two departments the provision connects, only one can invoke it. An agency correctly advised that the provision imposes nothing on it is in no position to initiate the consultation the provision contemplates. If consultation is to begin at all, it begins with an approach from this Department. The Foundation asks that the approach be made in writing, to each agency, and that the Department say on the record which approaches it made.

b. The statutory warrant, which is express in one of the two provisions

Paragraph 360ii(a)(6) directs consultation and liaison without naming an instrument. Section 360jj supplies one for the studies it directs: in carrying out those studies the Secretary is to invite the participation of other Federal departments and agencies. Part II.I.4.f sets the provision out and establishes two things about it, that it is a second interagency requirement independent of § 360ii, and that it attaches to the studies rather than to the program generally. Part IX.K asks for those studies and for that invitation as part of them.

The Foundation records that the text of § 360jj(b) and (c) is paraphrased rather than quoted in this comment, from a secondary codification source, and that Part II.I.4.f says so. The request in this subsection does not depend on the paraphrase: paragraph (a)(6) directs consultation whatever instrument is used, and an agency cannot be consulted without being approached.

c. One agency has already offered, and the offer is conditioned on a request

Part II.H.20 records the nine agencies that answered the Foundation and what each said. One answer differs from the rest in a way that bears directly on this request. The other agencies said the subject was not theirs. The United States Access Board said the subject was not within its authority

and added that it would provide technical assistance to the Food and Drug Administration on request. It is the only one of the nine that offered to be consulted. Part II.H.11 treats the Board.

The Foundation asks the Department to notice the form of that offer. Assistance on request is contingent on a request being made, and the Foundation can locate no record that one was made. An offer that has stood open and untaken is not a failure by the agency that made it; it is an invitation already accepted in advance, waiting only for the letter that would trigger it. Of all the requests in this Part, this is the one with the least standing in its way.

d. What the Department of Labor correspondence establishes, stated accurately rather than favorably

It would be convenient for the Foundation to report that the Department of Labor has said it is waiting to be invited. It has not said that, and the Foundation states what the correspondence does establish because the weaker account is the accurate one and the stronger would be refuted from the documents themselves.

Part II.H.10 sets out the exchange. On August 15, 2024 the Director of the Directorate of Standards and Guidance replied to a Foundation petition and to a further letter, stating that the agency cannot violate the provision relied upon because that provision does not apply to it, and declining the requested consultation with the Food and Drug Administration on that basis. The comment records that the agency was correct, and that the Foundation had asked the wrong department.

So the Department of Labor did not decline an invitation and did not say it awaited one. It declined a request that it perform a duty that is not its to perform. The Foundation submits that this is the firmer ground of the two, because it rests on the statute rather than on an agency's willingness: an invitation issued by this Department is a different act from the request that agency properly refused, and nothing in its answer bears on how it would respond to one.

Two further matters in that correspondence bear on what an invitation should ask for. Part II.H.10 records that in 2022 the agency stated that its Directorate of Standards and Guidance would examine the relevant scientific literature and monitor developments. Whether it did, and what it found, is precisely the kind of information paragraph 360ii(a)(6)(A) contemplates passing between the two departments, and this Department can ask for it. And that agency has been on notice of this subject since 2022, so a consultation initiated by this Department would not be arriving unannounced.

e. What the Foundation asks

That the Department send a written invitation to consult and maintain liaison, concerning the visible light emitted by light-emitting diode products, to each department named expressly in § 360ii(a)(6), being the Secretary of Commerce, the Secretary of Defense and the Secretary of Labor, and to each agency identified at Part II.H as falling within the residual category of other appropriate Federal departments and agencies.

That the invitation identify the subject with enough particularity to be answerable, rather than in terms that permit a reply that the subject is not the recipient's. The Foundation suggests three elements: the emissions at issue, expressed in the quantities at Part I.G; the product classes at Part VI that the recipient's own program places in the public way; and the characteristics at Part III in which a boundary would have to be drawn.

That where the study at Part IX.K is conducted, the invitation to participate attaching to it be sent to the same agencies, so that the two provisions are performed together rather than separately.

And that the Department state on the record of this proceeding which invitations were sent, on what dates, and what replies were received. Where no invitation was sent to a department named expressly in the statute, the Foundation asks that the Department say so. Part II.H.22 collects what the record presently shows, which as to most of these agencies is nothing either way.

The Foundation states the cost of what it asks, because it is the smallest of any request in this Part. An invitation is a letter. It commits the Department to no conclusion, concedes nothing about what these products emit or whether anyone is harmed by them, requires no rulemaking, and can be sent before any of the research at Part IX.C is begun.

f. The statute directs the Secretary to maintain liaison, and a thing cannot be maintained before it exists

The Foundation rests this request on the verbs, and states first what they are not, because the point is sometimes put in a form the text will not bear. Neither of the liaison paragraphs uses the word establish. Paragraph (a)(3) directs the Secretary to "maintain liaison with and receive information from" other Federal and State departments and agencies with related interests. Paragraph (a)(6) directs him to "consult and maintain liaison with" the Secretary of Commerce, the Secretary of Defense, the Secretary of Labor, the Atomic Energy Commission, and other appropriate Federal departments and agencies, on the two subjects it then names.

The word establish appears in the clause that governs both of them. Section 360ii(a) directs that the Secretary "shall establish and carry out an electronic product radiation control program designed to protect the public health and safety from electronic product radiation," and provides that "as a part of such program, he shall" do the six things the paragraphs enumerate. Part II.D.1 sets out the structure and establishes that each of the six is introduced by shall as a component of a mandatory program.

Two consequences follow, and the Foundation separates them because they are independent and either would do.

The first is structural. The duty to establish attaches to the program, and the liaison paragraphs are components of the program the Secretary is directed to establish. A program of which the liaison component has never been brought into being has not been established as to that component, whatever has been done about the others.

That consequence does not rest on the Foundation's reading alone. The Department has already asserted the premise it depends on. Part II.D.1 records that, asked in litigation whether it had complied with § 360ii, the United States answered that the Food and Drug Administration "has complied with the statute and established such a program," citing 21 C.F.R. §§ 1000.1 to 1040.30.

The Foundation takes that representation at its word and asks what follows from it. The program the United States says was established is the program of which paragraphs (a)(3) and (a)(6) are components, because the opening clause of § 360ii(a) makes them so. A representation that the program has been established is therefore a representation that extends to its liaison component. The Department can accordingly be asked, without any contest about the other five paragraphs and without reopening the litigation in which the answer was given, what the liaison component of the established program consists of: with which agencies it subsists, through which officials it is conducted, and in what record it is recorded. Part II.D.1 makes a separate observation about the regulations cited in that answer, which this subsection does not repeat.

A federal agency outside this Department has read the provision the same way, and the Foundation records it because the agency in question is the one at item c. Part II.H.11 sets out the Access Board's answer declining a petition, in which the Board construed § 360ii as directing the Food and Drug Administration to establish and carry out an electronic product radiation control program, and quoted paragraph (a)(6) in full in support of that reading. The only agency of the nine that offered to be consulted is also the agency that identified, in writing, the provision under which the consultation would occur.

The second is a matter of ordinary language and does not depend on the first. Maintain is a verb that presupposes its object. A relationship cannot be maintained before it exists, any more than a register can be kept before it is opened. A direction to maintain liaison therefore entails that a liaison relationship be brought into existence, and the entailment is in the meaning of the word rather than

in any gloss the Foundation puts upon it. Congress could have written consult from time to time and stopped there, which would have described a series of discrete events and nothing continuing. In paragraph (a)(6) it wrote both.

That conjunction is the sharper form of the argument and the Foundation puts it separately, because the two verbs paragraph (a)(6) joins are of different character. Consult describes an act that is performed and completed, and that can be performed again. Maintain liaison describes a condition that persists between the acts. A provision that directs both is not satisfied by either alone. A Department that consulted on one occasion and maintained nothing afterward would have performed half of what the paragraph directs. A Department holding a standing channel on which it never consulted about the two subjects the paragraph names, being techniques, equipment and programs for testing and evaluating electronic product radiation and the development of performance standards under § 360kk, would have performed the other half.

The contrast with the neighboring paragraph is available, and the Foundation relies on it for no more than it shows. Paragraph (a)(3) directs the Secretary to maintain liaison with and receive information from a broad class of bodies, and it does not contain the word consult. Paragraph (a)(6) contains it, and contains it as to the departments it names expressly and as to the two subjects it specifies. The word appears in the one paragraph and not in the other, and the Foundation reads the difference as doing work rather than as inadvertent. Part II.E and Part II.H treat the two paragraphs separately for that reason.

The practical consequence is that the sequence subsection g sets out is not an overlay the Foundation has placed on the statute. The invitation and the instrument are acts of consultation. The standing relationship they would bring into being is the thing that is afterward maintained. The two verbs of paragraph (a)(6) correspond to the two stages, and the Foundation has organized its request in those stages because the paragraph names them.

The Foundation states the limit of the argument. It does not contend that the statute prescribes the form the establishment must take, and subsection g is offered as content rather than as a reading of the text. What it contends is that something must exist before it can be maintained, and that the Department has not identified anything that does. Part II.H.22 collects what the record shows as to each agency.

g. What establishment consists of, and what maintenance would then implement

The Foundation offers three elements. It does not present them as required by the text, and the Department may discharge the duty in any form it chooses. They are offered because the duty has so far been treated as though it had no determinate content, and these three have determinate content and determinate answers.

First, a named point of contact. Consultation between departments is conducted by people. A duty framed as a relationship between two Secretaries is performed, in practice, by identified officials with the subject in their portfolio, and the Foundation asks the Department to identify, for each agency, the official within the Center for Devices and Radiological Health who holds this subject and the official at the other agency with whom he or she deals. Part II.H.15 records an instance in which an agency outside this Department identified its own officer by name and title in correspondence with the Foundation, which shows the question is an answerable one.

Second, an instrument recording what the two agencies will address. Four things would give it content: which product classes at Part VI are within it; which emission characteristics at Part III are within it; which agency holds which authority over them, so that the question of allocation Part IX.M raises is answered rather than left open; and what information is to pass between them and how often, which is the subject paragraph (a)(6)(A) names. The Foundation understands memoranda of understanding to be the instrument this Department customarily uses to record relationships of this kind, and asks the Department to state whether any memorandum of understanding presently in force covers the visible light emitted by light-emitting diode products with any of the agencies at

Part II.H. That is a question the Department can answer from its own records and the Foundation cannot answer at all.

Third, maintenance, which is the performance of what the instrument records. Part II.I.6 develops the proposition that a duty performed once is not a duty discharged, and it applies with particular force to this verb: a liaison established and then left dormant is a liaison not maintained. The Foundation does not ask for a stated interval and would not know what interval to ask for.

What this adds to the request, and the Foundation states it because it is the reason for making it in this form: it converts an obligation that has been treated as unanswerable into questions with determinate answers. Asked whether consultation has occurred, a Department may reasonably reply that consultation is a matter of degree and that contacts of various kinds occur. Asked who the point of contact is, and whether an instrument exists, and what it covers, the answer is yes with particulars or no. Part II.H.21 describes what the present record shows about the program as a whole, and the Foundation submits that the difficulty there is in part a difficulty about the form in which the question has been put.

One concession, stated because it bears on how much weight the second element can carry. An instrument that recorded nothing would establish nothing, and the Foundation would not be assisted by a memorandum executed for the sake of having one. The instrument matters only as evidence that the subject has been identified and the responsibility allocated. If the Department can show that both have happened without an instrument, the Foundation's point is met.

h. The limit of the request

An invitation is not consultation, and the Foundation does not present the sending of letters as the discharge of the duty. The provision directs the Department to consult and to maintain liaison, and maintain is a continuing verb; Part II.I.6 develops the point that a duty performed once is not a duty discharged. A letter to each agency would begin what paragraph (a)(6) contemplates. It would not complete it.

Nor does the Foundation ask that any other agency be directed to do anything. Part II.H.10 is explicit on that and this subsection does not depart from it. The request is that this Department discharge its own duty, and the Foundation asks nothing of the recipients of the invitations beyond that they receive them.

F. Require Disclosure of Emission Characteristics [RFI Q9]

This is the least expensive request in this Part and the Foundation puts it in those terms deliberately. Disclosure requires no exposure criterion, no threshold, no finding about health, and no determination that any product is harmful. It requires only that what a product does be stated in quantities that mean something. Every other request in this Part asks the Department to decide something. This one asks that a fact be published.

What should be disclosed is set out at Part III, which identifies sixteen characteristics requiring boundaries, and Part IX.C, which asks that the emission be characterized. The quantities the Foundation asks be disclosed for a product offered for sale are the spectral power distribution rather than the correlated color temperature, for the reason Part V.J.4 gives; the luminance of the emitting surface rather than only the luminous flux of the product; the luminous intensity and its distribution; the depth and frequency of temporal modulation, and the rise and decay times; and the geometry under which each was measured, because Part V.J.2 establishes that the measurement conditions determine the result.

The instrument is at Part IX.J.5, which sets out the labeling authority and the precedent this Department has already set in using it, and Part IX.J.1 establishes that the recommendation authority at § 360ii(b)(1) is not the standard-setting authority and is not conditioned on a determination that a standard is necessary. The three subsections below set out who needs the

disclosure and for what, because the answer differs and the form of the disclosure should follow the use.

1. To purchasers and specifiers

A purchaser cannot specify what is not published. Part VIII.G.2 sets out the consequence at the point of procurement and Part VIII.F.2 sets out the asymmetry it produces between an entity that holds the product literature and a person who holds only an account of their own symptoms.

What a specifier needs is a figure that can be written into a solicitation and tested on delivery. At present a specifier can require a correlated color temperature, a luminous flux, an efficacy in lumens per watt and a warranty term, because those are the quantities manufacturers publish. None of them describes what the product does to a person who looks at it. A specifier who wished to require a maximum source luminance, a limit on short-wavelength content expressed spectrally, or a modulation depth below a stated figure cannot, because the information does not exist in published form. Part VI.E.1 and Part VI.D record the same difficulty for school districts and municipalities.

The Foundation asks that disclosure be required in a form a purchaser can use, which means a published figure for a identified model rather than a statement of typical performance for a product family, and that the measurement geometry accompany each figure.

2. To state and local public entities conducting accessibility self-evaluations

This is the subsection on which Part VIII depends, and the Foundation states the connection exactly. Part VIII.C sets out the four steps a self-evaluation of an emitting product would require under 28 C.F.R. § 35.105. The second step is characterizing what each product emits, and Part VIII.C.2 establishes that it cannot be completed. The third and fourth steps depend on the second.

Disclosure would not supply the criterion. Part VIII.D.3 is careful about that: the entity would still have no federal figure against which to evaluate what it learned, and that is the subject of Part IX.I. What disclosure would supply is the other half of the problem, which is that at present the entity cannot even establish what it operates. An entity that could obtain, for each luminaire in its inventory, the quantities listed in the preamble to this subsection would be able to complete step one and most of step two of its own duty, and to compare the alternatives at step four, which Part VIII.C.4 describes.

The Foundation asks that the disclosure be framed with this use in mind, which has one practical consequence worth naming. A public entity does not purchase a lamp; it purchases an installation, frequently through a contractor and frequently as part of an energy program. Disclosure that reaches only the retail carton does not reach the entity. Part IV.G sets out the federal framework through which much of this equipment was procured.

3. To workers, schools, and healthcare providers

Three settings in which the exposed person neither selects the lighting nor can leave it, and in which somebody other than the manufacturer has a duty toward them.

Workers. Part V.H treats occupational exposure, Part VIII.B.6 sets out the employment provision and records that thirty-two of the 593 accounts at Appendix A describe work or employment, and Part VII.J.3 establishes that nothing is monitored. An employer asked to accommodate an employee who reports that the lighting is disabling has, at present, no description of what the lighting emits. Disclosure would give the employer something to work with, and Part VIII.B.4 establishes that the inquiry the employer owes is individualized and fact-specific.

Schools. Part VI.E treats interior lighting in schools and Part VI.E.2 sets out the position of children under it. A district procuring lighting for a classroom is procuring an exposure for the population Part IX.L identifies as both differently sensitive and differently exposed, and Part VI.E.1 records that it cannot specify by source luminance or short-wavelength content because the information is not published.

Healthcare providers. Part VI.E also treats healthcare settings and Part VIII.F.4 sets out an account from this record of a request for accommodation of lighting in a hospital emergency department, refused on the ground of a recent remodel. A provider deciding whether it can offer a patient a setting free of a particular emission needs to know which of its own fixtures emit what, and no provider can presently obtain that. Part VIII.B.3 records that this Department is the agency designated under Title II for programs, services and regulatory activities relating to the provision of health care and social services, which makes this the setting in which the Department's two capacities meet most directly.

G. Develop a Classification System for Optical Radiation Exposure [RFI Q5.p]

1. Spectral characteristics

The quantities in this family are the spectral power distribution; the short-wavelength content; the peak wavelength and bandwidth; and the weighted quantities appropriate to each response under consideration.

Part III.C treats spectral distribution as a characteristic requiring a boundary and Part V.B.1 and Part V.B.3 set out the physical account, including why correlated color temperature does not determine short-wavelength content and therefore cannot serve as the descriptor in this family.

2. Spatial characteristics

The quantities in this family are source radiance; apparent source size and angular subtense; directionality and beam distribution; uniformity across the emitting surface; the number, separation and arrangement of emitters; and the distance and geometry of the exposure.

Part III.D treats each of these and Part V.B.2 and Part V.B.8 set out the physical account. Part IX.C.2 asks that geometry and apparent source size be characterized, and Part V.J.2 establishes that the geometry of a measurement determines its result, so a criterion in this family is uninterpretable without a stated measurement geometry.

3. Temporal characteristics

The quantities in this family are modulation depth and waveform; drive frequency and flash rate; duty cycle; rise and fall times; single-exposure duration; and cumulative exposure.

Part III.E treats each of these and Part V.D sets out the physical and biological account. Part IX.C.3 asks that modulation be resolved rather than integrated away, and Part IX.I.2 sets out why this family would have to be regulated differently from the other two.

4. The effect families each class of characteristic bears upon

A classification is useful only if it says what each class is a classification for. The Foundation asks that each class of characteristic be stated together with the effects it bears upon, and sets out the correspondence it would propose.

The spectral characteristics at subsection 1 bear upon photochemical retinal response, which Part V.C.1 and Part V.C.2 treat; upon circadian and neuroendocrine response, which Part V.F treats; and upon the trigeminal and melanopsin-mediated pathways at Part V.E.4. They bear upon these through different action spectra, which is why Part IX.C.4 asks that the weighting appropriate to each response be adopted rather than one function applied to all.

The spatial characteristics at subsection 2 bear upon disability glare and veiling luminance at Part V.C.3, upon discomfort glare at Part V.C.4, and upon the photochemical response insofar as the angular subtense of the source determines which exposure limit applies, as Part V.C.2 sets out.

The temporal characteristics at subsection 3 bear upon photosensitive response at Part V.E.1, upon the stroboscopic and phantom-array effects at Part V.D.2, upon migraine and headache at Part V.E.2, and upon interference with clinical measurement at Part V.D.5.

The Foundation states the limitation of the whole table. These are the effects to which each family of characteristics is relevant, on the literature appraised at Part V and Appendix C. They are not dose-response relationships, no threshold is asserted for any of them, and Part V.K.4 records the 2018 Opinion's statement that reliable dose-response information is not available for the healthy general public across the wavelengths these products emit.

5. Why a criterion addressing one family alone is insufficient

A criterion that bounded one family alone would be satisfied by products that are unaltered in the respect that matters, and the Foundation gives three demonstrations drawn from the record rather than arguing the point abstractly.

Spectral alone. A product can be brought within any spectral criterion by lowering its correlated color temperature, and Part V.B.3 establishes that correlated color temperature does not determine blue content, so the adjustment need not change the emission in the respect intended. Appendix C records effects obtained with sources from which the short-wavelength content had already been reduced.

Spatial alone. A product can satisfy a limit on luminous intensity or illuminance while concentrating its output into a smaller emitting area, which raises the luminance and the apparent brightness without exceeding the limit. Part V.B.2 sets out the geometry and Part III.D.2 and Part III.D.3 treat radiance and luminance as characteristics requiring their own boundaries for this reason.

Temporal alone. A product can satisfy a modulation criterion expressed as an average while presenting abrupt transitions, because Part III.E.2 establishes that rise and decay times are not captured by modulation depth and frequency alone. And Part VIII.D.4 supplies the converse: a device whose flash rate is capped and whose intensity is not can comply with the rate and still present an intensity the framework never bounded.

The conclusion is the one Part III.B states in the form of four boundary shapes. A criterion addressing a single family is not merely incomplete. It is avoidable, and a criterion that can be satisfied without changing the exposure is worse than none, because compliance with it becomes an answer to the person affected. Part VIII.E.4 records the one documented instance in this record of an entity giving conformity with a federal guideline as its answer to a request for accommodation, and what the determination said about it.

6. Correspondence with the characteristics listed in Question 5

Question 5 of the notice lists characteristics of an exposure. The Foundation sets out the correspondence between that list and the classification proposed in this subsection, because the correspondence is the answer to the question and because a reader should be able to check it rather than take it.

Part III is the subsection that performs the mapping in full. It identifies sixteen characteristics of an optical emission that require boundaries, groups them into the three families used here, and states for each whether a boundary presently exists and in what form. Part III.H sets it out as a table of seventeen rows and the Foundation does not reproduce the table here.

What this subsection adds is the direction of the correspondence, which matters because it is the Foundation's position that the notice's list and the statutory language already fit together. The characteristics the notice names are properties of an emission and of an exposure to it. Paragraph 360ii(a)(2) names the emissions of, and the exposure of people to, unnecessary electronic product radiation. The notice is therefore asking, in the vocabulary of exposure assessment, about the quantities the statute directs the Secretary to minimize, and the Foundation asks the Department to

notice that it does not need a new framework to answer its own question. Part II.D sets out the paragraph and Part III.A the two questions a boundary has to answer.

7. Assign product codes to the light-emitting diode product classes that have none, and amend Table 1 to 21 C.F.R. § 1002.1 accordingly

The preceding six subsections propose a classification of exposure. This one proposes something narrower, cheaper and immediately available: a classification of products, in the system the Center already operates.

The Center maintains a classification of radiation-emitting electronic products in which each class carries a product code, a definition, a radiation type, the reports required of it and the performance standard applicable to it. The Foundation has searched that classification and sets out the result at Appendix F. In summary: three hundred and ten product codes are classified as optical; one hundred and forty-nine of them carry a performance standard, and one hundred and forty-one of those one hundred and forty-nine are laser products. The only other optical standards in the system are four codes for sunlamp products and four for high-intensity mercury vapor lamps. Within the category the Center calls General Optical Products, Non-Medical, there are twenty-one codes and twenty of the twenty-one record that no standard applies.

Five of those codes are for light-emitting diode products and three more are for displays. The Center has therefore classified the lamp, the indicator, the decorative string, the bare diode sold as a component, the toy, the liquid crystal display, the digital display monitor and the flat-panel television. What it has not classified is the roadway. There is no code for a diode headlamp, a diode signal or marker lamp, a diode emergency or warning beacon, a pedestrian crossing beacon, a diode roadway luminaire or an outdoor message sign. There are codes for the laser versions of two of those, and each carries a performance standard under 21 C.F.R. part 1040 and an annual reporting obligation.

The Foundation therefore asks the Department to do three things, in the order given, none of which requires a performance standard to exist first.

First, assign product codes to the classes identified at Appendix F.2. That subsection proposes thirteen, with a product name, a definition, a category, a radiation type and a cross-reference to the Part of this comment that describes the exposure, in the form the Center's own entries use. The Foundation does not ask that its drafting be adopted. It asks that the classes be recognized, and it has done the drafting so that the request is a specific action rather than a direction to think about one.

Second, amend Table 1 to 21 C.F.R. § 1002.1 so that the classes so assigned are subject to a product report under § 1002.10 and an annual report under § 1002.13. The Foundation frames that as parity rather than as a new burden. A laser traffic signal and laser automotive lighting and signals are each required to report annually today. The diode products that perform the same function on the same roadway are required to report nothing. The Department is asked to close that difference in the direction of the instrument it already uses.

Third, and this is the step that makes the first two worth taking, use what the reports produce. A product report under § 1002.10 requires a manufacturer to describe the radiation emitted. Part V.J.4 of this comment is a census of a literature that could not say what its own light sources emitted; Part IX.F asks that emission characteristics be disclosed. The reporting obligation is the existing mechanism by which the Department would come to possess that information, and it is available now, under regulations already written, without waiting for the standard asked for at Part IX.I.

H. Reconstitute the Technical Electronic Product Radiation Safety Standards Committee

This request comes before the request to prescribe a standard because the statute puts it there. Section 360kk(f) directs that the Secretary consult the Committee before prescribing any performance standard under that section, and Part II.K establishes the consequence: a program whose standard-setting body cannot convene cannot set a standard, whatever the record before it. Part II.K sets out the statute, the implementing regulations at 21 C.F.R. part 14, subpart G, and the Committee's present condition, and this subsection does not restate any of it.

It is also the most readily achievable thing the Department can do in response to this record, and the Foundation puts that first because it bears on how the request should be read. It requires no rulemaking, no new science, no new authority and no agreement from anybody outside the Department. It requires appointments.

The four requests below ascend in what they ask. The first two ask something of the Department alone. The third asks the Department to put a question to the Committee. The fourth asks the Department to invite the Committee to use a power the Committee already has, and the Foundation has no means of predicting what the Committee would do with it.

1. Fill the statutory membership and confirm the charter

The Foundation asks that the fifteen seats be filled in the proportions the statute fixes, that the charter be confirmed as current, and that a Chairperson be appointed. Part II.K.1 sets out the composition: fifteen members, five from government, five from affected industries, five from the general public, with at least one representing organized labor, each technically qualified by training and experience in a field applicable to electronic product radiation safety.

Two provisions make this a precondition rather than a formality, and both are in the Code of Federal Regulations rather than in a charter the agency may revise. Part II.K.2.c sets out 21 C.F.R. § 14.125(c), which fixes the quorum at ten members, of which at least three shall be from each of the government, industry and general public categories. And the same subsection sets out § 14.125(d), under which the Chairperson ordinarily submits a report to the Commissioner within sixty days. If the office of Chairperson is vacant, the consultation the regulation contemplates cannot be completed as written, because the officer who is to report does not exist.

What the record shows about the seats is set out at Part II.K and the Foundation states only the arithmetic here. Nominations were sought in January 2025 for ten of the fifteen seats. A body with ten vacancies cannot meet the quorum that § 14.125(c) requires, and cannot meet the category minimums within it. The Foundation draws no inference about why the seats were vacant and asks only that they be filled.

The Foundation does not ask for any particular appointee, for any balance of view among the appointees, or for its own representation on the Committee. It has not sought a seat and does not seek one here. What it asks is that the body Congress required to exist be in a condition to act.

2. Publish the Committee's proceedings as § 360kk(f) and 21 C.F.R. § 14.130 require

Section 360kk(f) directs that all proceedings of the Committee be recorded and the record available for public inspection, and Part II.K.1 sets out that requirement. The Foundation asks that the Department publish the record of the Committee's proceedings, state when it last met, and state what it considered.

One meeting matters more than the rest and the Foundation identifies it for that reason. Part II.K records that the Committee is reported to have met in 2016 and to have discussed hazards of light-emitting diode products, including the blue light hazard, at a meeting at which the Center presented its own concerns about these products. If that is so, the subject of this comment was before the

statutory advisory committee, raised by the Center itself, in the decade before the determination of May 24, 2024.

The request that follows is narrow and is addressed to the record rather than to the merits. The Foundation asks that the minutes, presentation materials and any report of that meeting be published, and that the Department state whether the Committee has met since. The reason is at Part IX.B: the determination of May 24, 2024 rests in part on an assessment of the state of knowledge, and what this Department's own advisory committee was told about these products, and when, is part of that state of knowledge. Part IV.I.6 records that the agency's records on the subject remain unavailable to the public.

The Foundation does not assert that the 2016 meeting produced any recommendation, or that anything was concealed. It asks for a record the statute already says shall be available.

3. Refer visible light emitted by LED products to the Committee

The Foundation asks the Department to refer the subject of this comment to the Committee: visible light emitted by light-emitting diode products, as an instance of electronic product radiation within the meaning of the Act.

The referral does not require a proposed standard to exist, and that is the point of making it separately from Part IX.I. Part II.K.2.b sets out 21 C.F.R. § 14.122 in full. Paragraph (a)(2) is the consultation that attaches to standards proposed for consideration, and it is the only one of the Committee's three functions triggered by anything the Commissioner does. Paragraph (a)(3) provides that the Committee may make recommendations to the Commissioner on any other matters it deems necessary or appropriate in fulfilling the purposes of the Act, and it is not confined to standards at all. A referral under that paragraph asks the Committee for its view of a subject, which is a thing it may consider whether or not a standard is before it.

What a referral would accomplish that nothing else in this Part would. It would put the question to the body Congress designated as technically qualified to answer it, rather than to the Foundation, to a court, or to a sister agency that has said the subject is not its own. Part II.H establishes that every federal body the Foundation asked has declined the question. The Committee is the one body within the program whose function is to consider exactly this kind of question, and nobody has asked it.

The Foundation asks the Department to notice what the referral costs it, which is nothing. Referring a subject commits the Department to no position on the science, to no finding about any product, and to no standard. It is a precondition to performing the duty rather than a concession to a petitioner. If the Committee considers the subject and concludes that no standard is warranted, that conclusion would be a far stronger basis for the position taken in the Final Response of May 24, 2024 than the Final Response presently has, and the Foundation says so in the knowledge that the conclusion may go against it.

The Foundation asks that the referral transmit this comment, the record at Part VII, and the appraisal of the literature at Appendix C, and that the Committee be asked specifically whether the characteristics identified at Part III are the characteristics that require boundaries and whether any of them can presently be bounded on the available evidence.

4. Invite the Committee to exercise its authority to propose a standard

The Committee may propose a standard on its own motion. Part II.K.2.b sets out 21 C.F.R. § 14.122(a)(1), under which the Committee may propose electronic product radiation safety standards to the Commissioner for consideration, and Part II.K.1 sets out the statutory counterpart. The Foundation asks the Department to invite it to do so for the products this comment concerns.

The significance of the power is structural. Every other route to a standard in this Part begins with the Department deciding something: that the products are within the Act, that a characterization is needed, that a standard is necessary. This one does not. A proposal under paragraph (a)(1) originates with the Committee, which means there exists a route to a standard for these products

that does not depend on the agency acting first, and that route has been available throughout the period Part IV describes.

The Foundation states the limits of the request squarely, because the provision is less powerful than it first appears and a reader who checks will find that out. Paragraph (b) of the same section provides that responsibility for action on performance standards under 21 U.S.C. § 360kk rests with the Commissioner, after receiving the advice of the Committee. A proposal by the Committee is therefore not self-executing and binds nobody. It would be advice, and the Commissioner would remain free to decline it.

That is still worth asking for, and the Foundation gives the reason. A proposal from the Committee would be a technical document, produced by a body of fifteen technically qualified members drawn in equal parts from government, industry and the public, addressing what may be bounded and how. Nothing of that kind exists for these products anywhere, and Part VIII.D establishes that its absence is what leaves every public entity in the country without a referent. Whether the Commissioner adopted it or not, the document would exist.

The Foundation asserts no entitlement to any of this, does not predict what the Committee would propose, and does not ask that the Committee be directed to propose anything. The request is for an invitation.

I. Prescribe a Performance Standard Under § 360kk [RFI Q5.n]

This subsection asks for one performance standard and defers the rest, and the Foundation states the deferral as plainly as the request. A comment that asked the Secretary to prescribe limits on four emission characteristics, having spent Part V establishing that three of them cannot presently be expressed in any agreed quantity, would be asking for something that cannot be drafted and would deserve to be discounted on all four. The Foundation asks for the one that can be drafted now and says why the others cannot.

1. The order of operations, which the Foundation does not ask the Secretary to disturb

Two steps come before a standard and both are the subject of other subsections. Section 360kk(f) requires that the Technical Electronic Product Radiation Safety Standards Committee be consulted before a standard is prescribed, and subsection H asks that the Committee be reconstituted for that reason. Section 360kk(a)(1) conditions the prescribing of a standard on the Secretary's determination that one is necessary for the protection of the public health and safety. The Foundation does not ask the Secretary to skip either step and does not assert that the determination has been made.

What the Foundation does ask is what Part II.D establishes about the relationship between that discretion and the duties that precede it. The condition in section 360kk(a)(1) governs whether a standard issues. It does not govern whether the Secretary studies and evaluates the emission, which paragraph 360ii(a)(4) directs without qualification, or whether the Secretary develops and evaluates procedures for minimizing exposure, which paragraph 360ii(a)(5) directs without qualification. A necessity determination that has never been attempted because the underlying evaluation has never been performed is not an exercise of discretion. It is the absence of one.

2. Why temporal light modulation is different from every other characteristic in this comment

Everywhere else this comment has had to concede that the number cannot yet be written. Part I.G establishes that no agreed spectral descriptor exists and that correlated color temperature is not one. Part V.J.4 establishes that the instruments in general use cannot see the wavelengths at issue, that the satellite record is unitless, and that a national government surveying eight measurement techniques found one that measures the relevant quantity and that one unavailable. Appendix D.1 records a national guideline stating that prescriptive limits on lighting are not possible. Those are real obstacles and the Foundation has not argued around them.

None of them applies to flicker, and the Foundation sets out four reasons.

First, the quantities are settled. Modulation depth, modulation frequency, duty cycle, waveform, and rise and fall times are defined, are measured by instruments that cost very little, and are not the subject of any dispute about units. There is no analogue here of the lux problem at Part V.J or the correlated-color-temperature problem at Part I.G. A photodiode and an oscilloscope resolve the question.

Second, a consensus standards body has already written the numerical criteria, in mandatory language, and nobody is bound by them. IEEE Std 1789-2015 is described at Appendix D.2 and treated at Part V.D. Its Recommended Practice 3 is set out below.

Third, the effects are documented in human beings, at frequencies human beings cannot perceive. Part V.D sets out the evidence and Appendix C.94 tabulates it: unperceived neurological effects from light-emitting diodes at frequencies up to 200 hertz, unperceived retinal effects between 76 and 162 hertz, and headache, visual disturbance and seizure at lower frequencies. The comment does not have to reason from a rodent or infer from an ecological endpoint to reach a human effect here.

Fourth, the Department has done this before for an optical emission characteristic. Section 1040.20 of title 21 prescribes emission limits for sunlamp products in terms of the ratio of irradiance in defined wavelength bands, as Part II.D and Part I.G describe. A performance standard expressed in a measured optical quantity, for a consumer product class, administered by this Center, already exists in the Code of Federal Regulations. The Foundation is not asking for a novel instrument.

3. What the Foundation asks the Secretary to consider prescribing

That the Secretary consider prescribing, for electronic products offered for sale in the United States whose function is general illumination or visual display, a limit on temporal light modulation of the emitted optical radiation. For the content of that limit the Foundation does not offer a number of its own. It asks the Secretary to begin from the one a consensus body has already written:

> "Recommended Practice 3: (seizure prevention) For any lighting source, under all operating scenarios, flicker Modulation (%) shall satisfy the following goal: Below 90 Hz, Modulation (%) is less than 5%."

Three features of that text are the reason the Foundation points to it rather than to the other two recommended practices in the same clause. Its terms are any lighting source, under all operating scenarios, and shall. The standard distinguishes it expressly from its neighbors, which begin with the words if it is desired, and its own commentary states that it is a strict rule for seizure prevention and should be adhered to at all times for all operating conditions. And the risk assessment behind it, at clause 7.4.1.3, identifies the susceptible subgroup as persons aged five to twenty-four and estimates the prevalence of seizure at between one in a hundred thousand and one in four thousand.

The Foundation asks the Secretary to notice what that combination amounts to. A standards body of the industry has concluded that a rule is strict, that it should be adhered to at all times, and that the population it protects includes children; and has expressed that conclusion in a document that binds nobody, that a purchaser cannot read without buying it, and that no federal instrument references. Whether that situation calls for a performance standard is the determination section 360kk(a)(1) commits to the Secretary. The Foundation submits that it is at least a determination worth making on the record rather than by default.

a. Four matters a standard would have to settle, which the recommended practice does not

The Foundation identifies these because a request that ignored them would not be serious. The measurement method, including the detector bandwidth and the averaging interval, since a modulation depth depends on how it is measured. The operating conditions at which compliance is assessed, which must include dimmed operation, because Part V.D records that modulation in these

products is commonly produced by the dimming method itself and a product compliant at full output may not be compliant at twenty percent. Whether compliance is assessed on a new product or over its service life, which no instrument in this comment presently addresses for any optical characteristic. And the treatment of products whose modulation is intended and perceived as a signal rather than as illumination, which Part VI.C discusses and which would require either exclusion or a separate limit.

b. A fifth matter, which the Foundation puts first in importance: the number of emitters a person meets at once

The four matters above concern how a single product is measured. This one concerns whether measuring a single product answers the question, and the Foundation states it at length because it bears on every performance standard this comment asks for and not only on the one asked for here.

A performance standard prescribed under 21 U.S.C. § 360kk bounds what a product emits. It does not bound what a person is exposed to. Those are different quantities whenever a person can meet more than one product at a time, and in every class at Part VI a person routinely meets many.

The statute itself distinguishes them. Paragraph 360ii(a)(2) directs the Secretary to support activities to minimize two things, not one: the emissions of, and the exposure of people to, unnecessary electronic product radiation. Part II.D.4 establishes that the two objects are coordinate. An emission is a property of a product. An exposure is a property of a place at a moment, and it is the sum of what everything emitting into that place contributes.

The established metrology says the same thing, and the comment has already set out the arithmetic. Part V.C.4.b gives the Unified Glare Rating of the International Commission on Illumination, which predicts discomfort glare from an installation as a logarithmic function of a summation over the glare sources in the field of view, each source entering the sum through its own luminance, solid angle and position. The quantity that term predicts is a property of the summation. A limit applied to one term in it is not a limit on the sum.

The accessibility framework has already conceded the point in the one place where it set an optical number. Part VIII.D.4 sets out that a visual alarm appliance is capped at a flash rate of 3 hertz, that the explanatory manual records that rates above 5 hertz may trigger seizures in people with certain forms of epilepsy, and that the manual's own worked example is two compliant appliances in one room presenting a composite rate of 6 hertz. Two products, each within the limit, producing an exposure outside it. The only instrument the framework offers against that outcome is a recommendation to synchronize.

The Department has already asked this question in this proceeding, about the other kind of radiation. Question 15 of the Request for Information asks for evidence on antenna density, cumulative neighborhood exposure, and simultaneous exposure to multiple sources. Part II.K. The Foundation asks that the same question be asked of the optical case, and observes that the optical case is the easier of the two to pose, because the sources are visible and countable and their geometry is known.

The scientific committee of the European Commission has identified the same gap. It records that there is insufficient knowledge about the actual exposure of people to optical radiation from light-emitting diode sources and about the total exposure from all optical radiation sources. Part V.K.4. The second clause is this matter.

c. A sixth matter: the shape of the transition, which the recommended practice does not reach either

Subsection 2 of this Part lists the quantities it describes as settled, and rise and fall times are among them: defined, measured by a photodiode and an oscilloscope, and attended by no dispute about

units. The Foundation therefore has to account for the fact that the criterion it points to does not mention them, and it does so here rather than leaving the omission to be noticed.

Recommended Practice 3 is written in modulation depth as a function of frequency. Modulation depth is computed from the maximum and the minimum output over a cycle and is indifferent to how the output travels between them. Flicker index is sensitive to waveform and is the nearest available quantity, and it is not a measure of transition time either. Part III.E.2 sets out the distinction and the reason it matters.

The consequence is that a standard written in modulation depth and frequency alone would be satisfied identically by two products that differ entirely in this characteristic: one whose output moves smoothly between its states, and one that switches in microseconds. The Foundation submits that those are not the same stimulus, and that nothing in the quantity chosen would distinguish them.

Part III.E.2 establishes the position in federal law, and it is a complete absence. Every federal instrument the Foundation has examined that addresses the temporal behavior of an optical emission specifies a schedule, meaning how often and for how long, and not one specifies a shape. The single apparent exception is a state specification that states transition time as a ceiling, which forbids slowness and is the opposite of what would be needed.

The boundary required in this dimension is accordingly a floor rather than a ceiling: a minimum transition duration, or equivalently a maximum rate of change of output. The Foundation cannot state the value and does not propose one. What it asks is that the matter be among those a standard settles rather than among those it omits by not naming them. A characteristic absent from a criterion is neither permitted nor forbidden by it; it is unaddressed, and Part VI.R.4 sets out what followed the last time a property of a converted lighting class went unaddressed because nothing had ever required it to be specified.

d. One consequence the Foundation reports against its own proposal

The Foundation recommends a radiance limit in several places in this comment, and Part V.B.2.2 sets out how such a limit is met: by enlarging the emitting aperture at unchanged luminous output, through a diffusing optic, a larger lens, or a greater number of emitters operated at lower drive current. The third of those techniques reduces the radiance of the product by increasing the number of emitters in it. The Foundation reports the consequence rather than leaving it to be found. A limit expressed on one product, met by multiplying emitters within that product, improves the quantity the standard measures. Whether it improves what a person meets depends on the geometry, and the standard as described would not ask.

e. What the Foundation asks, and the limit of what it can ask

It does not ask the Department to regulate how many luminaires a city installs, or how many vehicles are on a road. Section 360kk reaches products, not places, and the Foundation has been careful throughout this comment not to ask for authority the chapter does not confer. The request is narrower and is in three parts.

First, that the standard state the condition it assumes. That any performance standard prescribed for an optical emission specify, on its face, the number of emitting products and the geometry of their arrangement for which the limit was derived, as the reference distance and the aperture are specified. A limit derived for one product viewed alone should say so, so that a public entity performing the evaluation at Part VIII.C, or a purchaser reading a disclosure under Part IX.F, is not left to assume that compliance describes an installation.

Second, that the research include the aggregate. That the research directed by § 360ii(a)(2) and the studies and evaluations directed by § 360ii(a)(4), which Part IX.C addresses, include the exposure produced by multiple simultaneous sources in the arrangements set out at Part VI, and not only the emission of single products. The statutory warrant for this is

the second object of paragraph (a)(2), and the Foundation asks for nothing beyond what that paragraph names.

Third, that the recommendation instrument carry what the standard cannot. That a recommendation under § 360ii(b)(1), which Part IX.J addresses, state what a product standard does not reach, so that the entities which do control the arrangement of products in a place, and which Part IX.E identifies, have the Department's statement of the limit rather than an inference from its silence.

The Foundation states the obvious objection to all three and does not answer it. None of these is a number. Each is a requirement that a number, when it comes, be accompanied by a statement of what it assumes and what it leaves out. That is less than the Foundation would ask for if the research at Part IX.C had been done, and it is as much as the record presently supports.

4. Technical achievability and practicability under section 360kk(a)(2)

Section 360kk(a)(2) directs that a performance standard be technically achievable and that the Secretary take into account the reasonableness and practicability of its application. The Foundation offers three things and withholds a fourth.

That the criterion originates with the industry's own standards body rather than with this commenter, which is evidence that engineers familiar with the technology considered it attainable. That the measurement is inexpensive and routine, as set out above. And that products meeting it exist, since the criterion has been published for more than a decade and drivers producing low modulation are sold. What the Foundation withholds is any estimate of cost. It has no data on the incremental cost of compliance across the product class and will not supply a figure it cannot support. That is precisely the kind of question the Committee at subsection H exists to answer and the Foundation asks that it be put there.

5. What this subsection does not ask for, and why not

No limit on spectral content. No limit on luminance, illuminance or radiant intensity. No limit on the angular distribution of the emission. The Foundation believes each of those characteristics matters and Part IX.C asks that each be studied. It does not ask for a standard on any of them now, for the reason given at the head of this subsection: the comment has established that the quantity in which such a limit would be expressed is not settled, and a limit cannot be prescribed in a quantity nobody has agreed. Part I.G sets out the candidates for a spectral descriptor and the demonstrated defects of each, including a published warning that a limit written in the leading candidate could be satisfied by moving a diode's pump wavelength into the violet. The Foundation will not ask the Secretary to prescribe a limit it has itself shown to be evadable.

When the research at subsection C supplies the quantities, the same request should be made for the other three characteristics, and the Foundation says so now so that the narrowness of this subsection is not read as a concession that the others do not warrant standards. They do. They are not yet draftable. Flicker is.

No limit on products whose function is to flash, and the question that exclusion leaves unasked

The standard asked for at subsection 3 is confined to products whose function is general illumination or visual display. A notification appliance is neither. Its purpose is to be noticed, and in such a device modulation is the signal rather than an artifact of the driver circuit. Warning beacons and emergency lamps at Part VI.C are in the same position.

The exclusion is deliberate, and the reason is one the Foundation states against its own criterion. Recommended Practice 3 applies to any lighting source, under all operating scenarios, and requires modulation below 90 hertz to be less than 5 percent. A visible alarm flashing between full output and darkness at 3 hertz has a modulation of 100 percent at 3 hertz. It exceeds that criterion by a factor of twenty, and so does every warning beacon in the country. A request to apply the criterion to all

products would therefore be a request to prohibit the notification appliance that deaf and hard-of-hearing people depend on, and the Foundation asks for nothing of the kind.

But the exclusion leaves a question unasked, and the Foundation puts it here rather than leaving it. The accessibility specification set out at Part VIII.D.4 bounds the flash rate of a visible alarm in both directions, at a minimum of 1 hertz and a maximum of 3 hertz. It bounds the pulse duration at a maximum of two tenths of a second. It bounds the duty cycle at a maximum of 40 percent. It specifies a xenon strobe type or equivalent. It does not bound the transition. Nothing in it requires the output to switch abruptly, and nothing in it forbids an appliance whose output rises and falls over a measurable interval.

Two things follow and the Foundation separates them. The first is that the minimization this chapter directs is available in this class without amending the accessibility specification at all. A manufacturer who built a visible alarm whose output ramped rather than switched, at a rate within the permitted band, would be building a compliant appliance. The Foundation is not aware that anyone has built one, and is not aware of any evaluation of whether such an appliance would notify as effectively.

The second is that whether the abruptness, and the rate, are necessary to the notification function is an empirical question, and it is the question paragraph 360ii(a)(5) directs the Secretary to answer: to develop, test and evaluate the effectiveness of procedures and techniques for minimizing exposure to electronic product radiation. Part II.G sets out the paragraph and Part III.G the techniques. The questions are specific and answerable. Does an appliance flashing at 1 hertz notify as reliably as one flashing at 3? Does an appliance whose output ramps notify as reliably as one that switches instantaneously? Does a steady indication, dark before and illuminated now, notify as reliably as either? The Foundation does not know the answer to any of them and asserts none.

What it asks is that the Department answer them, and state the answer whichever way it falls. If the abrupt high-rate flash is necessary to notify a person who cannot hear the audible alarm, that is a finding this Department is equipped to make and the Foundation will accept it. The finding would also establish that the emission is necessary within the meaning of paragraph (a)(2), which is the test at Part II.D.2, and the question would be closed. If it is not necessary, then a characteristic that Part V.E.1 associates with seizure, and that the explanatory manual of the accessibility framework itself records as capable of triggering seizures above 5 hertz, is being emitted into schools, hospitals and workplaces without serving a purpose for the person who receives it. Part VI.E describes those settings. Either answer is useful to the Department and to the public. The absence of either is the condition this comment describes.

The Foundation states the limit of this request in terms, because the subject admits of no ambiguity. It does not ask that visible alarms be made dimmer, slower or less noticeable. It does not ask for any reduction in the effectiveness with which a deaf or hard-of-hearing person is warned of a fire. Part VIII of this comment is addressed to disability access, and a request that degraded the warning a disabled person receives would be inconsistent with the whole of it. The request is whether the same notification performance can be obtained with temporal characteristics less aggressive than those now in use, and if it cannot, that the Department say so.

J. Make Recommendations Under § 360ii(b)(1), Without Waiting for a Standard

The requests at subsections C and I are for research and for a performance standard. Both take years. This subsection asks for something the Department may begin now, and the Foundation puts it forward because of what Part VIII describes. A city choosing a streetlight, a school district specifying classroom lighting, a manufacturer designing an appliance and a person buying a lamp all operate today with no federal criterion of any kind. Not a weak criterion. None.

1. The authority is express, and it is not the standard-setting authority

The Foundation does not rest this request on § 360kk. A performance standard is binding, requires rulemaking, and is conditioned by § 360kk(a)(1) on the Secretary's determination that one is necessary. The authority for this request is elsewhere in the same subchapter and is addressed to recommendations rather than to standards. Section 360ii(b)(1)(B) authorizes the Secretary to make such recommendations relating to such hazards and control as he considers appropriate, the hazards and control in question being those of electronic product radiation. Part II.B.

The Foundation accepts the discretionary character of that provision and does not argue around it. The question it raises is not whether the Secretary must make recommendations. It is whether the Secretary has considered whether to, and on what basis he concluded that none was appropriate for a product class that accounts for most human exposure to artificial optical radiation. The Foundation has found no record of that consideration.

Two further provisions support the request. Section 360ii(b)(1)(A) authorizes the Secretary to collect and make available, through publications and other appropriate means, the results of research and studies relating to the nature and extent of the hazards and control of electronic product radiation. And § 360ii(a)(5), which is a duty rather than a power, directs the Secretary to develop, test, and evaluate the effectiveness of procedures and techniques for minimizing exposure. A technique for minimizing exposure that is developed and never communicated to anyone positioned to apply it has not been given its effect.

The instrument also exists and this Center already uses it for the other light-emitting product class in this program. Part II.E.4 describes Laser Notice No. 56, guidance issued by the Center for Devices and Radiological Health in 2019, succeeding Laser Notice No. 50. Recommendations under the electronic product radiation control program are not a novel instrument requiring new authority. They are an instrument the Center has in hand, has used, and has not used here.

2. What can be issued now, without new research

The Foundation is careful here, because a comment that faults the Department for stating a conclusion ahead of the record cannot coherently ask the Department to publish numbers the record does not support. Each of the following either transmits what is already published or recommends a capability rather than a threshold.

- Transmit the quantitative recommendations that consensus bodies have already published. Recommendations expressed in melanopic equivalent daylight illuminance exist and are described at Part V.J.4. The Department need not originate them. Collecting and making available the results of research and studies is what § 360ii(b)(1)(A) describes.
- State what the existing photobiological hazard framework covers and where it stops. Part V.C.2. A purchaser told that a product conforms to a photobiological safety standard is entitled to know what that conformity was assessed against and what it was not.
- State that lumens, watts and correlated color temperature do not describe the spectral content of a source, and identify the quantities that do. Parts V.B.3 and V.J.1. This is a statement of physics rather than of risk, and it is not in dispute.
- Recommend capability rather than level, wherever the level is not yet known. That an indicator lamp on a household appliance be capable of being dimmed or extinguished by the user. That an outdoor luminaire be capable of dimming and scheduling, and be shielded against emission above the horizontal. That a product intended for a bedroom default to its lowest output. And that an indicator whose function is to confirm that a product is working normally indicate instead only the departure from normal, so that the lamp is dark while nothing is wrong. None of these requires a dose-response relationship.

Identify the emission information a purchaser or specifier should request from a manufacturer, which subsection F addresses as a disclosure obligation and which can be recommended in the meantime.

The Foundation draws attention to the fourth of those in particular. A recommendation that a user be able to switch off an indicator lamp asserts nothing about whether the lamp is harmful. It requires no finding about anyone's health, it is available on the present state of knowledge, it costs the manufacturer a switch, and it restores to the person exposed a choice that the design of the product removed. The Foundation suggests that the indicator lamps now fitted to household appliances are the clearest illustration in this comment of a gap that cannot be explained by difficulty. They are electronic products. What they emit is electronic product radiation. They are installed in bedrooms and kitchens and operate through the night. There is no federal criterion of any kind addressed to them, and no one has suggested that there is any obstacle to recommending that they be capable of being turned off.

The Foundation draws attention to the last of those as well, because it is the only recommendation in this comment that disposes of a measurement problem instead of solving it. Every other proposal about indicator lamps runs into the difficulty that the right emission depends on the ambient condition: a lamp set to be visible in a lit room is punishing in a dark one, and a lamp set for the dark room cannot be seen in daylight. An indicator that is dark unless something is wrong has no such difficulty, because for almost the whole of its service life it emits nothing at all, and when it does emit, the condition it reports is one the occupant wants brought to their attention. The question of how bright a confirmation of normality should be does not arise, because there is no reason to confirm normality continuously to a person who has not asked.

Two limits on that, stated by the Foundation. It does not apply to a product whose indication is itself a safety function required by another authority, and the Foundation has not established which household products are subject to such a requirement. It also does not apply to an indication a user has asked for. The recommendation is about the default, which is the only thing a recommendation under § 360ii(b)(1) can reach.

One contrast is worth recording because it shows that the federal government already specifies quantities of this kind when it chooses to. Under the Department of Housing and Urban Development's construction standards for manufactured homes, a visible notification appliance installed in a room designed for sleeping must have a minimum rating of 177 candelas, with a lower figure permitted in stated mounting conditions. 24 C.F.R. § 3280.209(f). That is a federal regulation fixing, in candelas, how much light a device in a bedroom must produce. It is a floor and not a ceiling, and it governs an alarm rather than a status lamp, so the Foundation does not offer it as a precedent for a limit. It offers it for the narrow point that the unit, the setting and the exercise are all familiar to the federal government, and that what is missing for the products this comment concerns is not the technique.

3. What must wait for the research, and should be acknowledged now

The Foundation does not ask the Department to publish today a maximum illuminance for a sleeping environment, a maximum luminance for an appliance indicator, or a permitted short-wavelength content for a street luminaire. Those are the numbers that matter most and they are the numbers the record does not yet support. To ask for them now would be to ask the Department to do what Part I.C.7 faults it for having done, in the opposite direction.

What the Foundation asks instead is that any recommendations issued state which questions the Department regards as unresolved, what evidence would resolve them, and when it expects to address them. A document saying plainly that no federal recommendation exists for the illuminance of a sleeping environment, that the question is under study, and that a recommendation will follow when the study supports one, is worth more than the present silence. It tells a purchaser the truth about the state of the record.

The Foundation adds one observation about what such a record would have to contain, because an instance of it now exists. Obayashi and others measured bedroom light directly, with light meters, in 2,947 adults in Japan. They report a median bedroom intensity of 1.0 lux with an interquartile range of 0.2 to 4.0 lux, and associations at thresholds of 3 and 10 lux with measures of obesity, blood lipids, systemic inflammation, sleep disturbance and depressive symptoms. Appendix C.32.

That is the shape of the evidence on which a recommendation could eventually rest: direct instrumental measurement of the exposure in the place where it occurs, at a scale sufficient to describe its distribution across a population. The Foundation does not propose those thresholds as federal recommendations and could not. It is one cross-sectional study, in one country, in a cohort whose mean age was 69, reported in photopic lux and therefore carrying no information about spectral composition. What the Foundation offers it for is narrower: the measurement is feasible, it has been performed at population scale, and nothing of the kind has been performed in the United States. Paragraph 360ii(a)(4) directs the Secretary to study and evaluate conditions of exposure, and § 360ii(b)(4) authorizes the Secretary to procure electronic products for research and testing purposes. Part II.B. Neither the authority nor the method is missing.

4. The limits of the instrument, stated by the Foundation

First, a recommendation is not a substitute for a performance standard and the Foundation does not offer it as one. The request at subsection I stands. Issuing recommendations would not discharge § 360ii(a)(1), would not satisfy § 360kk, and should not be treated as closing the question whether a standard is necessary. The Foundation asks that any document issued say so expressly, so that it cannot later be read as a determination that no standard is required.

Second, a recommendation binds no one. A manufacturer may disregard it and a city may ignore it. The Foundation regards it as valuable nonetheless, for the reason Part VIII gives: a public entity conducting the self-evaluation that 28 C.F.R. § 35.105 requires needs a criterion to evaluate against, and a published federal recommendation is a criterion even when it is not a rule.

Third, this Department regulates products and not their operation by others. The Foundation does not ask it to direct any city when to switch off a streetlight, which is not within this authority. It asks that the luminaire be recommended to have the capability, and that the Department publish the exposure information on which a city would decide. The distinction is observed throughout this subsection.

5. The labeling instrument, and the precedent the Department has already set

One instrument deserves separate mention, because the Foundation has found no reference to it anywhere in the agency's treatment of light-emitting diode products and because the Department has used it before, on a light-emitting product, under this subchapter.

Section 1040.20 of title 21 prescribes a performance standard for sunlamp products and ultraviolet lamps. Paragraph (d) of that section is headed Label requirements, and it provides that in addition to the labeling requirements of part 801 and the certification and identification requirements of §§ 1010.2 and 1010.3, each such product shall bear a label containing a warning statement. The regulation then sets out the words. They begin:

> "DANGER—Ultraviolet radiation. Follow instructions. Avoid overexposure. As with natural sunlight, overexposure can cause eye and skin injury and allergic reactions. Repeated exposure may cause premature aging of the skin and skin cancer–"

The regulation goes on to require a recommended exposure position, directions for achieving it, a recommended exposure schedule including duration and spacing, and a statement of the time before results appear; and it specifies that the label be permanently affixed to an exterior surface, legible and readily accessible to the person being exposed immediately before use. 21 C.F.R. § 1040.20(d).

The Foundation asks the Department to hold that beside the products described in Part VI. The Department has already determined, for one class of light-emitting product, that the user is entitled to be told in prescribed words what the product emits, what overexposure may cause, how far away to stand, and for how long. Whatever may be said about whether a comparable determination is warranted for any other lamp, it cannot be said that the instrument is unavailable or that the Department lacks experience of it.

Two consequences follow, and the Foundation separates them because they travel by different routes.

A mandatory label is part of a performance standard. The requirement at § 1040.20(d) exists because a standard was prescribed under § 360kk, and a label requirement for any other product would travel the same way, through rulemaking. That request belongs with subsection I and the Foundation does not make it here.

A recommended label does not. Section 360ii(b)(1)(B) authorizes the Secretary to make such recommendations relating to the hazards and control of electronic product radiation as he considers appropriate, and a recommended form of consumer information is a recommendation. The Foundation asks that the Department consider whether any such recommendation is appropriate for products emitting visible light, and that if it concludes none is, it say why.

The Foundation records that the proposition has been put to researchers in this field, and records with equal care what kind of evidence that is. A survey described at Appendix C.25 asked circadian researchers whether light-emitting diode lamps with high content between 460 and 495 nanometers should carry the warning label maybe harmful if used at night, and 79.1 percent of those responding agreed. That item appeared in the survey's expert-opinion section rather than among its statements of evidence; the response rate was low; and the survey was funded by a lighting company whose commercial position is described in that entry. The Foundation therefore offers it for one proposition only, which does not depend on any of that: the question of whether such products should be labeled is one that people who study this subject are actively asking. Whether the answer is yes is for the Department, on a record it has not yet assembled.

6. Why this is the least that could be asked

Of everything requested in this Part, this request costs least. It requires no finding of harm, no rulemaking, no appropriation of consequence, and no authority the Center does not already hold and use. If the Department concludes that the evidence does not yet support a performance standard, that conclusion is entirely consistent with making the recommendations described at subsection 2. If the Department concludes that the evidence supports not even those, the Foundation asks it to identify which of the five items it regards as unsupported, and why.

K. Conduct the § 360jj Studies and Report to Congress [RFI Q18]

This is the only request in this Part addressed to a provision outside § 360ii, and the only one whose product is a document delivered to another branch of government rather than held or published by the Department. Part II.I sets out the provision, what it directs, and the single occasion on which the study it directs was performed.

1. What the Foundation asks, and the three things it does not ask

The Foundation asks four things. That the Secretary conduct the study directed by 21 U.S.C. § 360jj(a)(2) as it bears on electronic products that emit visible light. That he make a report of the result to the Congress under § 360jj(a). That in carrying out the study he invite the participation of other Federal departments and agencies, as subsections (b) and (c) of the same section direct and as Part IX.E.5 asks separately. And that the report carry such recommendations for legislation as he may deem appropriate.

The first thing the Foundation does not ask for is the repealed annual report, and it identifies the distinction because the two provisions are easily conflated and a request that confused them would deserve to be refused. Part C of this subchapter originally carried two reporting obligations. One was a standing requirement that the Secretary report annually to Congress on the administration of the program, codified at 21 U.S.C. § 360qq, under which annual reports were transmitted for approximately three decades. Congress repealed it by Public Law 105-362, title VI, § 601(a)(2)(A), on November 10, 1998. Part II.I.8 sets out the repeal. The Foundation does not ask the Department to resume a reporting obligation Congress eliminated. The studies-and-reports provision at § 360jj was not repealed and is the provision this subsection concerns.

The second thing it does not ask is that the study reach any particular conclusion. The study § 360jj(a)(2) directs is a study to determine the necessity for the development of standards. A determination that standards are unnecessary would be a performance of the duty. The Foundation asks for the study and the report, not for the answer, and Part IX.I states separately and on its own grounds the one standard it asks the Secretary to consider prescribing.

The third is that it does not ask the Department to decide the pending petition in this proceeding. Subsection 5 sets out why.

2. The provision is differently conditioned in its two halves, and the request tracks the difference

Section 360jj(a) provides:

> "The Secretary shall conduct the following studies, and shall make a report or reports of the results of such studies to the Congress on or before January 1, 1970, and from time to time thereafter as he may find necessary, together with such recommendations for legislation as he may deem appropriate"

Part II.I.2 draws the distinction this request depends on, and the Foundation restates it here only to show that the request is shaped to it. The direction to conduct the studies carries no qualifier: the Secretary shall conduct them. The first report carried a date certain, January 1, 1970, and it was made; Part II.I.4 sets out the document. Two things in the provision are committed to judgment. Whether further reports are made from time to time thereafter turns on what the Secretary finds necessary. What legislative recommendations accompany a report turns on what he deems appropriate.

The Foundation therefore asks for the unconditioned thing without qualification and for the conditioned thing in the only form the condition permits. It asks that the study be conducted. It asks that the Secretary determine whether a further report is necessary, and that he state the determination and the basis for it.

The Foundation is careful about what it says of that determination, and says it in the terms this comment uses throughout. It does not contend that the Secretary must find a report necessary; the statute gives him that finding and the Foundation does not ask the Department to treat the word necessary as though it were absent. What it contends is that the finding is one the statute assigns to him, that the Foundation can locate no instance of its having been reached as to any product emitting visible light, and that a judgment a statute assigns is not exercised by never being taken up. The complaint is of discretion unexercised, not of discretion abused, and the remedy correspondingly is that the Secretary exercise it either way and say which.

3. Why the study has never been performed for these products, which is a point about scope and not about staleness

Part II.I.4 establishes the position from the agency's own document rather than from silence, and the Foundation summarizes it here because it is the factual premise of the request. The duty was performed once. The study was carried out during 1969 and reported to Congress in April 1970. The staff document performing the second study is BRH/DEP 70-30, issued by the Division of

Electronic Products of the Bureau of Radiological Health, and its preface and its introduction each state the scope: the study was confined to three classes of products, being industrial radiographic and fluoroscopic x-ray units, particle accelerators, and analytical x-ray equipment.

All three emit ionizing radiation. Not one is a source of visible light. The statutory definition at § 360hh(1)(A) reaches ionizing and non-ionizing electromagnetic radiation alike, and Part II.B establishes that it reaches the emissions this comment concerns; the study as performed addressed the first branch of that definition and not the second.

The Foundation states the argument in the form Part II.I.4 states it, because the distinction is the whole of its force. This is not a contention that a 1970 study has grown old and should be refreshed. A report that is old is still a report. It is a contention that the study never addressed this subject matter at all, so that as to products emitting visible light the duty has not been performed once rather than performed long ago. The products did not exist in 1969: Part II.I.4 records that high-brightness white light-emitting diodes suitable for general illumination were not commercially available until the late 1990s.

One feature of the 1970 study tells against any assumption that a study of this kind is a formality that concludes against regulation. As to particle accelerators it concluded that standards were needed. Part II.I.4 quotes the sentence. Where the second study was performed, it found a need for standards.

4. What a report under this provision would do that no other request in this Part does

Every other request in Part IX produces something the Department holds, publishes, or prescribes. This one produces a document addressed to Congress, and the Foundation identifies two consequences of that difference.

The first is that the report would arrive to a body that has already acted on the adjacent subject. Part IV.F sets out what Congress has done. A report under § 360jj(a)(2) would place before that body a federal account of what these products emit and of the conditions under which people are exposed to them, which is at present not available to it from any federal source.

The second concerns the legislative-recommendation clause, and it answers something this record contains repeatedly. A recurring federal response to this subject is that it lies outside the responding agency's authority. Part VIII.E.6 records an instance and Part II.H collects the agencies. If the Secretary concludes, after conducting the study, that the authority or the resources to address this radiation are wanting, § 360jj(a) is the vehicle Congress supplied for telling Congress so. The Foundation draws attention to that because it makes the request available to the Department on any view of the merits: a Secretary who thinks the subject beyond his present powers can perform this duty by saying that to the body that can supply them, and saying it concedes nothing about whether these products injure anyone.

5. The pending petition, and the limit of what this comment asks about it

On December 30, 2025 the Soft Lights Foundation and Mark Baker petitioned the Commissioner of Food and Drugs under 21 C.F.R. §§ 10.25 and 10.30 to conduct the study § 360jj(a)(2) directs and to submit a report to Congress. Part II.I.5 sets out the petition, what it asks, and its procedural history: a response of the kind permitted by 21 C.F.R. § 10.30(e)(2) issued on June 18, 2026, stating that the petition raises issues requiring further review and analysis by agency officials, and the matter remains pending. The Foundation does not contend that the regulation was contravened. Part II.I.5 says so and this subsection does not revisit it.

The Foundation does not ask the Department to decide the petition in this proceeding, and does not suggest that a response to a request for information is the place to decide it. The two proceedings are separate and should remain so. It identifies the overlap for one reason only: the subject of the petition is a subject of this request for information, and a Department asking the public what it should do about human exposure to electromagnetic radiation has before it, at the same time, a

pending petition asking it to do this particular thing about one part of that radiation. The Foundation thought it better to say so than to leave the Department to discover it.

One matter of capacity, which this comment keeps separate throughout. The petition was submitted jointly by the Soft Lights Foundation and by Mr. Baker in his individual capacity, which Part IV.A.2 records. This comment is the Foundation's alone. Nothing in this subsection is advanced on behalf of Mr. Baker individually, and nothing in it is intended to enlarge or alter the petition.

L. Address Sensitive Populations Expressly [RFI Q11]

The Foundation asks one thing under this head and states it in a sentence. Whatever the Department characterizes, recommends, publishes or prescribes about an optical emission, it should state expressly which population the figure is written to protect. That is the whole of the request. It is not a request for a particular number.

Two categories, which are commonly confused

The populations this comment concerns divide in two, and a criterion that addresses one does not address the other.

Differently sensitive. The same exposure produces a different response. Part V.G and Part V.E treat the literature; the conditions reported include photosensitive epilepsy, migraine and photophobia, traumatic brain injury, and autism and other sensory processing differences. Part VII.A.4 records the self-identified condition categories of the 593 reporters at Appendix A, and Part VII.K treats the group as a whole. Part III.F treats the exposed person as one of the sixteen characteristics that require a boundary.

Differently exposed. The same emission delivers a different dose. This category is less often noticed and is the stronger of the two, because it does not depend on any claim about individual susceptibility. Part V.C.2.g sets out the measured age-dependence of ocular transmission in the short-wavelength band: a young eye transmits far more of it to the retina than an older one. Part VI.E.2 sets out the position of children in school lighting, which combines the longest compulsory exposure, the least filtering, and no capacity to consent or to avoid. A criterion written to a standard observer of unstated age does not protect that population, and it does not fail because the population is unusual. It fails because the criterion did not say who it was about.

Why the request is for an express statement rather than for a number

Because a criterion silent as to population does not thereby apply to everybody. It applies to whoever the measurement model assumed, and the models in general use assume an unimpaired adult observer. Part III.F draws the consequence and Part VIII.B.2 draws it for this Department specifically: a criterion written to the comfort of an unimpaired observer, adopted by a Department that carries a duty under section 504 of the Rehabilitation Act, would exclude by construction the people the duty exists to reach. The exclusion in such a case is not a decision anyone made. It is a consequence of a question nobody asked.

The Foundation is not the first to ask for this. Part V.C.2 quotes a recommendation to the same effect published in a reference work in 2015, and the Foundation relies on it rather than on its own formulation.

Four things that would satisfy the request

That every figure the Department publishes about an optical emission name the population it is written to protect, and the response it is written to prevent.

That where the data for a population is absent, the absence be recorded rather than the population omitted. Part VIII.D.3 makes the equivalent point about a public entity's self-evaluation: a record that states what is not known is more useful than a record that does not reach the subject.

That a percentile of the general population not be used as a proxy for a sensitive one. The two are different quantities. A value exceeded by five percent of a general population says nothing about a person whose response differs in kind rather than in degree.

And that these populations be included in the research requested at Part IX.C.6 and in whatever surveillance is established under Part IX.D, which is where the data to answer the question would come from.

What the Foundation does not ask

It does not ask that the most sensitive individual set the limit, and it says so because that is the request it would be assumed to be making. A criterion set to the most reactive person who can be identified would be refused, would deserve to be refused on the grounds Part IX.I.4 sets out as to practicability, and is not necessary to anything this comment asks for. What the Foundation asks is that the choice be visible. If the Department sets a figure that protects some populations and not others, that is a decision it is entitled to make, and the Foundation asks only that a reader be able to tell which it did.

M. Additional Matters for the Department's Consideration [RFI Q18]

Three matters do not belong under any of the heads above and the Foundation sets them out here rather than leaving them unstated.

First, the allocation of responsibility, which no document presently states

Part II.H records what nine federal agencies said when the Foundation wrote to them between March 2022 and August 2023. Most answered that the subject was not within their authority. One is barred by statute from acting on it. One stated that it holds no statutory authority over visible light or non-ionizing radiation from electrical devices and has no experts in the subject. One said it would defer to this Department. And one, the United States Access Board, offered technical assistance to this Department on request, which Part II.H.11 and Part IX.E.5.c set out.

The Foundation asks the Department to state the allocation rather than to leave it to be inferred from that correspondence. Specifically: which of the product classes at Part VI are within this Department's program; which of the characteristics at Part III are within it; which agency holds which authority over the remainder; and what information is to pass between them and how often, which is the subject of Part IX.E. Part VI.U is the table this comment reserves for the first two of those, and the Foundation records that it is not written.

The reason this matters more than an ordinary question of jurisdiction is that the subject has been declined by every federal body asked except the one that has not answered the question. Part IX.A asks for the answer in its narrowest form, which is confirmation that visible light emitted by these products is electronic product radiation within the Act.

Second, the defect route, which requires no rulemaking and no standard

Part II.J.1 sets out § 360ll and the provision at § 360ll(e) under which the Secretary, upon determining that an electronic product has a defect relating to the safety of its use by reason of the emission of electronic product radiation, may direct the manufacturer to furnish notification. The Foundation invoked the provision on December 1, 2025 and sets out at Part II.J.1.c what that letter did and did not accomplish. It asks the Department to notice that the first trigger of § 360ll(a)(1) does not depend on a performance standard existing, and therefore does not depend on the ground taken in the Final Response of May 24, 2024. The Foundation does not ask for a defect determination on this comment and says why at Part II.J.1.c.

Third, what becomes of this comment

The Foundation asks that the Department state what it does with the material filed here: whether the reports at Appendix A are entered into any Departmental record, whether this comment is

transmitted to the Center for Devices and Radiological Health, and whether any of the questions in Part IX receives an answer. The request is modest and the reason for it is at Part IV.I: the Foundation's experience of transmitting material to this Department is that transmittal is acknowledged and disposition is not stated, and a comment whose fate is unrecorded cannot be distinguished later from one that was never filed.

X. CONCLUSION

A. The Question the Department Asked, and the Answer This Comment Gives

The Department asked, in Docket No. HHS-OASH-2026-0397, what is known and what should be done about human exposure to electromagnetic radiation. The request is addressed principally to radiofrequency emissions and electromagnetic fields. The Foundation's answer concerns a different region of the same spectrum: the visible light emitted by light-emitting diode products.

That is responsive rather than adjacent, and Part II.B establishes why. The definition at 21 U.S.C. § 360hh(1)(A) reaches "any ionizing or non-ionizing electromagnetic or particulate radiation", and the Department has already classified these products under it: Appendix F reproduces the twenty-three radiation-emitting product codes the Center has assigned to light-emitting diode products, and proposes thirteen more for the classes to which no code presently corresponds.

The continuity is not an analogy, and Part III.D.6 states the reason in one line. Irradiance and power density are the same quantity, in the same unit, differing only in the part of the spectrum measured. Radiofrequency exposure in the United States is limited in watts per square meter. Optical exposure can be expressed in watts per square meter. A program that measures one part of a single quantity and leaves the other unmeasured is not drawing a line between two different kinds of thing.

The answer this comment gives to the Department's question is therefore short, and the remainder of the document is its support. The exposure the Department is asking about has an optical component. That component is among the most widely encountered forms of electronic product radiation in the country, placed there in substantial part by federal policy, as Part IV.G sets out. This Department holds the authority over it. And the program Congress directed it to establish and carry out has not been applied to it.

B. The Program Exists, and It Has Never Been Applied to This Radiation

The Foundation states the defect precisely, because the imprecise version of it is refutable from the Department's own records and the precise version is not.

The electronic product radiation control program directed by § 360ii(a) exists, and the Foundation does not contend otherwise. The agency established it and has carried it out. Part II.C.2 collects the performance standards prescribed under § 360kk for the product classes the agency selected: diagnostic x-ray systems, microwave ovens, laser products, sunlamp products, and high-intensity mercury vapor discharge lamps, among the others gathered in parts 1020 through 1040. One of those standards, at 21 C.F.R. § 1040.30, is a lighting standard written around a radiometric quantity that luminous output does not describe. The program is not a fiction and this comment nowhere treats it as one.

What the Foundation contends is narrower and, on the record assembled here, unanswered. As to the visible light emitted by light-emitting diode products, the program has never been applied at all. Part II.M sets out which duties have been discharged and which have not, and the summary is this. No performance standard under § 360kk governs this radiation. The Foundation has located no study or evaluation by the agency of these emissions or of the conditions of exposure to them. No consultation or liaison with the federal agencies whose own rules determine what these products emit appears in the public record. No procedure or technique for minimizing exposure has been

developed, tested or evaluated. And no research, development, training or operational activity directed to this radiation has been identified.

That is the defect, and it is a defect of application rather than of design. The program's mechanisms are adequate to the task: standards under § 360kk, research under § 360ii(a)(2), study and evaluation under (a)(4), minimization techniques under (a)(5), liaison under (a)(3) and (a)(6), an advisory committee under § 360kk(f), studies and reports to Congress under § 360jj, and recommendations under § 360ii(b)(1). Every one of them has been directed at other classes of electronic product radiation. Not one has been directed at this one.

One of those mechanisms is not presently capable of operating at all, and the Foundation records it here because it bears on what the Department can do and in what order. Part II.K.6 establishes that the statutory advisory committee § 360kk(f) requires is not presently constituted in a form that permits a performance standard to be proposed through it. A program whose standard-setting mechanism cannot be used is not, as to any subject, in a position to produce a standard.

C. Unnecessary Radiation, Including What Is Commonly Called Light Pollution

Paragraph 360ii(a)(2) directs the Secretary to plan, conduct, coordinate and support research, development, training and operational activities "to minimize the emissions of and the exposure of people to, unnecessary electronic product radiation". It is the provision on which this comment principally rests, for the reason Part II.D gives: it contains no finding, no determination and no threshold that must be reached before the duty attaches, and its only limiting word is the adjective describing the radiation.

That word is unnecessary, and Part II.D.2 establishes what it does here. It does not ask whether a component of the emission serves the purpose of the lamp, which is the question energy policy asks and answers in lumens delivered for each watt consumed. It asks whether the radiation serves any purpose for the person exposed to it. The two senses can point in opposite directions, and Part II.D.2.a describes a spectral region in which they appear to have done so.

Light pollution is unnecessary electronic product radiation within that paragraph. Part II.D.3 establishes it on the statutory text rather than by analogy: the radiation does not leave, it reaches people, and emission directed away from the surface an installation exists to serve performs no function for anyone. Part III.D.1 states the same thing as a characteristic requiring a boundary and identifies it as the clearest instance in this comment of radiation that is unnecessary without any demonstration of hazard: light emitted above the horizontal from a roadway luminaire illuminates no roadway, and light entering a bedroom window from a parking area illuminates no parking area.

The Foundation states the consequence it draws and the one it does not. It draws this: the duty to minimize unnecessary radiation attaches to radiation that is unnecessary, whether or not it has been shown to injure anyone, because the statute uses two different words and Congress chose the one it chose. The Senate report describes the subject of the 1968 Act as unknown, unnecessary and potentially hazardous radiation, and the three adjectives are disjunctive. It does not draw this: that light pollution is an environmental question this Department should take up as such. Part II.D.3 meets that objection and the Foundation does not enlarge on it here.

Part III sets out the sixteen characteristics of emission and exposure in which a boundary would have to be drawn if minimization is to mean anything, and says of each whether a number can presently be stated. For most of them it cannot. That is the premise of the request rather than a concession extracted from it. The research paragraph (a)(2) directs and the evaluation paragraph (a)(4) directs are what produce such numbers, and neither has been conducted as to this radiation.

D. The Only Agency With the Authority, and What the Foundation Asks

The Food and Drug Administration is the only federal agency Congress has authorized to control the radiation emitted by electronic products. That authority is conferred by part C of subchapter V of the Federal Food, Drug, and Cosmetic Act, 21 U.S.C. §§ 360hh to 360ss, and Part I sets it out.

That is not advanced as a rhetorical claim. It is the answer to the question this record raises most often. Part II.H collects the federal agencies whose own rules determine the optical output of these products, among them the agencies responsible for motor vehicles, highways, aviation, rail, energy, labor, consumer products and federal buildings. Part VIII.E.6 records the answer those agencies give when the question is put to them, which is that the subject is not theirs. In most instances they are right, and this comment says so. Part II.H.10 shows it for the Department of Labor: the liaison provision imposes no duty on that department, the agency said so, and the agency was correct.

The consequence is that the question has no other home. A person seeking to have this exposure evaluated is told by one agency that the provision does not apply to it, which is accurate, and by this Department that a performance standard is not necessary, which is the subject of Part I.C. The provision that connects the two is addressed to this Department, and of the two only this Department can invoke it.

What the Foundation asks is set out at Part IX and summarized at Part I.H. The shape of it is worth stating once in full, because a document of this length can be mistaken for a broader demand than it makes. The Foundation does not ask the Department to find that these products injure anyone. It does not ask for a ban on any product. It does not ask for performance standards across the sixteen characteristics; it asks for one, in the single dimension where the quantities are settled and a consensus body has already written a numerical criterion in mandatory language, and Part IX.I states the request and its limits. For the rest it asks for the things a program does before it regulates: research and evaluation, disclosure of what these products emit, consultation with the agencies that place them in the public way, an advisory committee in working order, the studies and the report to Congress that § 360jj directs, and the recommendations the Department may issue now under § 360ii(b)(1) without waiting for any of it.

The record on which it asks is in the appendices. Appendix A contains the complete LED Incident Report database, 593 reports. Appendix B contains the complete record of public comments submitted to the headlamp petition, 4,991 of them. Appendix C appraises 153 peer-reviewed articles. Appendix D lists the assessments, standards and other documents cited. Appendix E is a chronology of the petitions, litigation and congressional action described at Part IV. Appendix F sets out the thirty-six radiation-emitting product codes, twenty-three assigned and thirteen proposed.

One statement about capacity, which this comment maintains throughout and repeats here because the record contains matters of both kinds. This is the comment of the Soft Lights Foundation. Where the Foundation has described proceedings in which Mark Baker has acted in his individual capacity, Part IV.A.2 identifies them as his, and nothing in this comment is advanced on his behalf or seeks any relief for him.

The Department asked what should be done about human exposure to electromagnetic radiation. The Foundation's answer is that a part of that radiation is emitted by products in nearly every street and nearly every room in the country; that the people exposed to it did not choose the exposure and in most cases cannot avoid it; that this Department holds the sole federal authority to control it; and that the program Congress directed the Secretary to establish and carry out has not yet been applied to it. The Foundation asks that it be applied, and asks nothing in this comment that requires the Department to conclude anything about these products that the research it is directed to conduct has not yet established.

APPENDICES

Appendix A — LED Incident Reports (Complete Record)

This appendix reproduces the Foundation's LED Incident Report database in full: 593 reports, the earliest dated April 21, 2024 and the latest October 14, 2026. The database begins in April 2024 and there are no earlier reports. Each report was written by the person who experienced what it describes, submitted to the Foundation through the form described at Part VII.A.1, and then transmitted to the Food and Drug Administration as Part IV.B sets out. Every report here was therefore in the Department's possession before this Request for Information issued.

They are reproduced as received. Spelling, punctuation, capitalization and grammar are the reporter's own and have not been corrected. No report has been shortened, paraphrased, excerpted or omitted. Part I states the Foundation's reason: a count of reports is not the same evidence as the accounts themselves, and the particulars are what a reader needs in order to judge them.

Order and numbering. The reports are in date order, earliest first, which reverses the order of the Foundation's own file. The order was reversed so that a report received after this comment is filed can be added at the end without renumbering any report the comment cites. Where two reports share a date they are ordered by place.

The two fields the Foundation supplies. Each report is headed with the date it was received, the place the reporter entered on the form, and a condition category the reporter selected from the choices the form offers. The date format has been made uniform; the Foundation's file records some dates in numerals and some in words, and nothing else in the header has been altered. Four categories appear in more than one spelling and are reproduced as the file records them. Eight reports carry no category.

What the reports do not carry. No name, no street address, no telephone number, no electronic mail address, no clinical record. The Foundation has checked the whole set for each of those and found none. The condition categories are self-identified and are not diagnoses. Part VII.A.6 sets out the screening practice and its limits.

The Foundation reproduces each account without adopting its contents. Many reports attribute a condition to light-emitting diode exposure and some assert a causal relationship. Those are the reporters' statements of their own experience and belief. They are not findings, the Foundation does not advance them as findings, and Part VII.A.5 states what the database does and does not establish. A small number of reports also contain assertions on subjects outside this proceeding, which the Foundation neither endorses nor has removed, for the reason given above.

The reports

Reports received in 2024

April 2024

A.1 April 21, 2024 — Beaverton, OR — Autism

LED flashing lights cause me to suffer severe anxiety, panic attacks, and fear.

A.2 April 21, 2024 — Davis, CA — Migraine

I used to go for long walks at night in my neighborhood for exercise and as therapy for my chronic eye migraine issue. Since 2016 when the City replaced all the sodium vapor street lights with LEDs, I have not been able to walk at night due to the harsh glare and brightness of the lights. They are nothing like the old lights. Add to that all the LED house lights that have been installed since then. My neighborhood has become a no go zone. I paid mello roos taxes for years to pay for all the green spaces I can no longer use because of these lights. Some are even on all day and hurt my eyes even in

the day time. My health has suffered from not being able to get my walks - weight gain, high blood pressure. And this is just a fraction of the story. I can no longer drive at night because of the intense LED car headlights in my face. I cannot go into town at night to a restaurant or store for the same reason - LED lights everywhere. I cannot travel on a train or bus for the same reason. Airports also have these lights taking the joy out of plane travel. I have to shop for my groceries online in stores like Safeway that have installed these lights nationwide. If I get exposed to these lights, I will get a ripping eye ache that lasts for weeks, a feeling that the surface of my eyeballs has been lased.

A.3 April 22, 2024 — Wakefield, MI — None

Sitting in the left-turn lane waiting for the light to turn green, the pickup truck in the opposing left-turn lane had a new pinpoint LED turn signal that was so bright and so focused, was like a laser pointer shooting right into my right eye. Even in broad daylight the LED was so bright and so focused like a laser pointer I had to sheild my eyes with my hand until the traffic light turned green and I completed my turn. Hours later I am still seeing spots with my right eye. Praying there is no permanent damage.

A.4 April 23, 2024 — Dallas, TX — None

Makes me blind and hard to see road. Especially oncoming traffic when the lights are elevated higher than me.

A.5 April 23, 2024 — Sammamish, WA — Autism

I'm a lifelong resident of the Seattle area, and I was diagnosed with Asperger syndrome in early childhood. Additionally, I have been diagnosed with depression, adjustment disorder, anxiety, attention deficit disorder (ADD), and I suspect that I might also have undiagnosed post-traumatic stress disorder (PTSD).

My biggest concern, especially in the last couple of years, is the dangerously bright light-emitting diode (LED) headlights that have been proliferating on our roadways at a disturbing rate since the early 2020s. They have had deleterious impacts on my quality of life since I can no longer exercise outdoors or drive at night without fear of being exposed to excessively bright LED headlights, experiencing sensory overload, and having meltdowns as a result. Even during sunny days, if drivers leave those LED headlights on, they are still too bright and extremely unpleasant to look at; it's particularly worse when it's cloudy or raining. LED headlights, especially those on Teslas, are some of the worst offenders, to the extent that I can recognize a Tesla from a distance solely by its headlights.

I am an avid lifelong cyclist and ride my bike all over King County. I have visited places such as Skagit County, Whatcom County, Snohomish County, Pierce County, Vancouver Island, Point Roberts, Snoqualmie Pass, Cle Elum, Vashon Island, Whidbey Island, the Kitsap Peninsula, and San Juan Island—all by bicycle. I have also ridden on nearly every regional trail in the Seattle area as well. However, my enjoyment of this activity has been greatly diminished by the excessive glare from these LED headlights, starting in the early 2020s. I have effectively lost one of the best stress relief methods I use to cope with my mental health issues, compounding my problems even more.

I also enjoy going on walks, and they have also been impacted by these LED headlights, making it unpleasant for me. I can no longer enjoy walking outside at night, robbing me of the ability to walk during times when it's cooling off during what are supposed to be pleasant summer evenings. Again, even during the day, I constantly encounter excessive LED radiation and glare from these LED headlights.

Earlier this winter, my neighbor was driving a rental car equipped with LED headlights, which shone into my bedroom when they returned from work in the evening. They have since returned to their regular car, which still has halogen bulbs; however, one of their halogen lights has burned out, and I'm afraid the owner might install LED headlights to replace it. Despite this, I still have LED headlights shining towards my bedroom from passing drivers since I live near a "T" intersection. This situation makes me feel unsafe in my own home, particularly during winter when daylight is limited.

The distress caused by these lights has led to hospitalization, and I feel as though I'm under house arrest because of them, causing serious mobility issues for me. I have written to ALL, and I mean

ALL, of my elected officials at the state and federal level, and the lack of any adequate response has only added to my frustration and anguish.

My ultimate goal is to urge the government and policymakers to acknowledge the problems of these excessively bright LED headlights and the dangers they pose to the general public. I advocate for regulations on their brightness and for using a warmer color temperature instead of the bluish light, which disrupts circadian rhythms and makes it difficult to spot road hazards at night.

Personally, I wish to see LED headlights banned completely from our roadways in favor of tungsten filament halogen bulbs, which are less harsh and easier on the eyes. The so-called benefits of LED headlights are outweighed by the risks they pose to the general public, and for many of the reasons I have cited, they need to be completely banned from our public roadways.

I'm extremely appalled and deeply troubled by the fact that I cannot safely use public rights of way that I have paid my tax dollars for because these LED headlights have formed a discriminatory barrier and infringe on my constitutional rights to freedom of movement. I strongly urge the Food and Drug Administration to take action. I believe that these lights are a threat to national security and public health, and swift action must be taken. The current situation is completely unacceptable!

A.6 April 24, 2024 — Mantua, NJ — None

Multiple incidents. I had to cancel 2 gym memberships because of bright LED lighting they installed, and theres no gym within a workable distance that doesn't have this insane lighting. Ive cobbled together used gym equipment at home for more money than I could afford. I cant work without special tinted glasses, or I get migraine symptoms within minutes. Even with this protection there are places I cant stand and directions I cant look because some of the LED fixtures are simply too intense and instantly painful.

I can no longer go to the local grocery store under any circumstances, its too bright, and the list of places I cant go is growing as businesses install this harsh intense LED lighting. Shop Rite, Five Below, Giant Fitness, Planet Fitness, Pantry One, T Mobile- these are some of the places I simply cant enter with any level of protection short of a complete blackout blindfold.

A.7 April 25, 2024 — Horseheads, NY — Astigmatism

I have astigmatism, which is 30% of the population of ALL ages. LED headlights and all bright white LED lights give me a wicked headache all day that pain meds don't touch. I rented a car recently with LED headlights & I had a huge headache from the headlights reflecting off of other surfaces. So I can't even drive a car with LED headlights. Just in the past couple of weeks, I almost was in 3 accidents while being blinded by LED headlights. I have no problem with halogen headlights. My work commute is on a 2-lane road for an hour & I need to work to live. I can't just stay home. What kind of life is that? So I have to put my hand up to block the headlights of the line of cars going the opposite way and look at the white line. One morning when it was raining thus more reflections, I was on a slight bend and looked up just in time to see an older SUV unsafely trying to pass a huge line of cars coming right at me in my lane. They were hurrying to get back over maybe 20 feet from the nose of my car. They had aftermarket LED headlights, so it was like two big floodlights that blinded me. The 2nd time was I was approaching a roundabout and pickup truck from the opposite side had blinding LED headlights. I checked to make sure no one was coming from the left before I got there, but *poof* a car appeared out of no where and honked at me. They almost hit me. I was so distracted by being blinded by the LED headlights, I didn't see them. And another time I was at a crosswalk and had been stopped for other pedestrians. But a car going the opposite direction had blinding LED headlights. I didn't see the additional pedestrians until I was passing over the crosswalk. I had looked too. The pedestrian had thankfully stopped. They were partially blocked by my windshield frame too. Again, I never had these problems with halogens. LED headlights are dangerous! Explain to me how lights that are 800x brighter than halogens are not blinding other people. LED headlights are marginalizing almost 50% of the population...specifically people with disabilities that include astigmatism (30%), migraines (17% women & 6%), and seizures (4%). And we can't forget age discrimination against seniors with cataracts. It also affects the circadian rhythm and eye health of both people and wildlife...all of them. That is why there are blue light filters on devices. Please do the right thing and ban bright white LED headlights and LED lights in general.

A.8 April 27, 2024 — Coudersport, PA — None

I am beyond infuriated with the use of bright white LED lights, I'm beyond frustrated with the searing eye pain that LED lights procure, I am beyond infuriated with the intense migraines that I suffer from when dealing with bright white LED lights. I am beyond frustrated with the amount of pain that is brought upon me due to these LED lights. They are an unnecessary monstrosity that never should have been brought into public view! They are NOT beneficial in any way, shape, or form. In fact they are detrimental to society and the environment.

A.9 April 27, 2024 — Elk Grove, CA — Autism

The Ziosk portable kiosk payment system has a bright LED screen. During dinner at a Chilis restaurant, we placed the kiosk face down on the table to avoid exposure to the LED Visible Light radiation from the LED screen. At payment time, my partner inserted the credit card for processing. At the completion of the processing, a large white LED light on the side of the kiosk suddenly irradiated me with white LED Visible Light radiation. Due to the intensity of the white light, everything around me became black, except for the overwhelming feeling of bright white light. I felt disconnected from reality and as if I had entered a nightmare dream. I believe that I was partially unconscious. As I began to recover consciousness, I thought that perhaps I was staring at the LED flash on a cell phone, but that this was much more powerful. Then, as I became more aware of my surroundings, I realized that that the white light was from a large, white LED from the side of the Ziosk device. I felt nauseous, so I fell to my stomach and tried to vomit, but I only ended up coughing. I then felt overwhelming anxiety and panic and went to the kitchen, demanding accommodation. A staff person then began yelling at me. I ran outside screaming. I continued to try to vomit, but only spit came out. At some point, both of my hands went numb and tingly. The police were called. I dialed 911 to tell them not to turn on their LED flashing lights, but they had the red and blue flashing lights on, which further debilitated me.

A.10 April 27, 2024 — Izhevsk, Russia — Other

I cannot stand the LED headlights. It all started about 4 years ago when the amount of cars with LED headlights started to become noticeable. I understood at that time that I couldn't look at these lights because my mind goes sick, mye eyes begin immediately to get irritated to a very considerable degree that it really hurts, my muscles are becoming stiff and I get nervous tics, that is involuntary rapid head movements. Moreover, I begin to feel some sort of panic attack. Back then the amount of cars with LED headlights in my area was around 12-16 percent and it was possible to get along. Since then, the situation only got worse. The amount of cars with very blinding and extremely piercing LED headlights nears probably already 40 percent in may area and I gave up at all staring in the oncoming traffic direction because I just cannot do it any more.

Because of a neurological condition, I was not allowed to drive a car and now it seems that it's even for the better. I cannot even imagine how people drive nowadays with this killer light. In my country we have day running headlights as a must so the headlights are on 24/7. While there is a sunny and clear weather I can somewhat go along the road facing the opposite direction, but with a gloomy weather, rainy weather, dusk, let alone nighttime I cannot physically do this. I have to avoid major roads going either along residential areas with much less traffic or going along a pavement that runs parallel to the incoming traffic, thus I somehow can move away my head and eyes and to see what is going on on the upcoming a lane (a lane that is further away from the pavement). When using public transport I have to sit in that part of a bus/tram that has windows on the left right from the driver seat. so that I am spared to see the upcoming lanes with the upcoming traffic.

Thanks to all this, to a huge light pollution caused by LEDs and other numerous LED lights sources sprung up recently, I am almost confined at home during nighttime because I cannot stand this light. Only warm shielded LED in moderate quantities are more or less OK for me, but unshielded LEDs over 3000 K, bright LED shop signage, LED digital billboards and LED decorative building lighting makes me have fits of very severe panic attacks. I don't feel these attacks at all with outdoor halogen headlights and sodium/incandescent/CFL lamps or warm (2700 K and less LEDs in moderate quantities). The indoor LED lighting has less negative impact on me, though too much white indoor LED light is also uncomfortable while the indoor white fluorescent light is quite OK for me.

I am asking the US regulatory agencies to give the answer why LED light can trigger severe panic attacks while other light sources are quite alright and even uncomfortable. I am sure that I am not alone.

A.11 April 27, 2024 — Rodeo, CA — None

I drive a fairly small car. On the highway at night, I find the excessively bright LED headlamps are both disrupting and an impediment to driver safety. As cars approach from the rear on either side, their headlamps reflected in my side-view mirrors are often so dazzling that I have to hold my hand in front of the mirror to be able to safely see the road. Even with my rear-view mirror in the "night" position, the brilliance of these headlamps when behind me can be distracting and blinding.

When approaching from the opposite direction, especially on narrow roads, they present even greater threat to driver comfort and safety, often causing momentary blindness. The worst cases are often Tesla headlamps, but many newer SUVs and pickup truck headlamps exhibit similar characteristics and are very nearly as bad.

These headlamps are unnecessarily bright, producing an spectrum of light that is especially blinding. They often illuminate not only the road, but the overhead road signs and the interior of the cars ahead of them. These headlamps are both a nuisance and a hazard to other drivers. And, in recent years, it seems to be getting worse. The headlamp arms-race is rapidly getting out of control at the expense of driver safety. Car makers must be made to comply with existing headlamp regulations, and, in fact, those regulations must be amended to consider ever increasing lux levels, higher color temperatures, and broader and taller light-pattern spread.

A.12 April 27, 2024 — Tuscon, AZ — None

LED headlights are having a negative impact on my driving continuously. I have good night vision, excellent reflexes, am generally quite alert at night. But I rarely drive at night because of the hazard of LED headlights. They blind me to the point where I cannot see the road AT ALL. I have very mild cataracts, and LED headlights totally make me see nothing but white. The only way I can navigate safely is to MEMORIZE the road ahead while I can still see it, and DRIVE TO THE RIGHT of the oncoming car. If it is a road I am not familiar with, I might not be willing to drive it at all. It is too easy to be surprised by an unexpected curve when I cannot see the road. I drive prudently. I am not willing to put up with this hazard. So I do not drive at night if I can possibly help it, and this has an impact on my life, and my ability to get home safely if I end up having to stay someplace away from home longer than anticipated. People are going to do what they have to do to stay safe. The mere fact there are not more accidents is not proof that LED headlights are safe. It is only proof that people try to avoid hazards, and may not be driving at all during nighttime hours. And what kind of harm does a laser directly into the face do to the eyes any time of day? Unanswered question.

A.13 April 28, 2024 — Algonguin, IL — Photophobia

I can't go out at night anymore due to the plague that is LED light pollution. It brought me solace. I can't walk my dog or enjoy it at all anymore. I don't see wildlife at night anymore. I love nature and it's harder to appreciate now. I used to love driving but I can't without immediate extreme dizziness and migraine. I can't look outside at all when the sun starts to set. The building I work at has hideously bright LEDs that make me ill on a daily basis. I'm always squinting and adverting my eyes. ALWAYS. It took many aspects and simple pleasures of my life away and I miss them dearly. Please do something about this! I want my life back!

A.14 April 28, 2024 — Amesbury, MA — None

I am blinded by these headlights, streetlights, floodlights morning and night every day. These lights are a hazard on the road and unnecessarily bright and incorrectly dispersed. This is a danger to everyone and regulations need to occur swiftly

A.15 April 28, 2024 — Baltimore, MD — None

I can't for the life of me understand how this is even something I have to report. Do none of these people drive at night or in inclement weather? Do none of them pass billboards? I used to love driving at night, even prefer it in some cases, but the new street lights are terrible, especially the defective ones that turn purple and create such harsh lighting I literally can't look at it. And the LOW beams on

the new cars are more blinding than some of the old high beams!!!! I've flashed my lights at other drivers to alert them they're driving with high beams on and they flash back that it's their low beams. Not only does it "daze" my eyes so that I see spots and can't see the road properly for a few seconds, but it also creates harsh lighting conditions that makes it hard to discern what's hiding in the shadows behind objects like trees and street signs. And the blue hue of these LEDs that's being used is also not only harmful and exhausting on the eyes but colors things weirdly so it's harder to tell what's what. The car I drive still has "older" (aka not blue or insanely bright) headlights, and I used to love renting cars for longer trips but now every car I rent has those headlights which makes it an unsafe environment to drive in, and in those vehicles I have other cars flashing their lights at me to alert me I'm driving with high beams when I'm not!!!! Which again, causes a "daze" and I see spots and my sight is not clear while I'm maneuvering roads at night. This is clearly unsafe!!! I'm in my 30s! I don't have other eye problems and I shouldn't sound like a crotchety old person when talking about driving at night! It's absurd! In addition to all that, I've recently experienced billboards that switched from canvas to LED and LED signs outside of businesses that are so insanely bright you can probably see them from space. It might be necessary during the day when the ambient light is brighter, but these things need light censors and to adjust to a dimmer display during the night time. Because when I drive by it's like someone shining a flashlight in my eyes for a minute. It's absolutely not safe!!!! I have a similar issue with the road crews that do construction on the highway at night. A bunch of those crews have these flood lights that are supposed to illuminate the area for them but they aim them in such a way that they blind the drivers too! Who's "genius" idea was that!? Either the people making these things are blind as bats anyway or they just don't care.

A.16 April 28, 2024 — Chicago, IL — None

Every single day day or night I am blinded over and over again even driving short distances, I get spots and yesterday my eye was in actual physical pain as 1 car was so dam bright like the eclipse!!!! I'm collecting evidence to sue. We all should sue every driver who damages our vision and the government for allowing this!!! you CANNOT drive anymore EVER. Our Country is lost.

A.17 April 28, 2024 — Fareham, United Kingdom — None

Comment on statement "DOE researched studies and other publications to ascertain any known impacts of LED lamps on human health and has not found any evidence concluding that LED lighting used for general lighting applications directly results in adverse health effects.": 'General lighting applications ' is not the same as directed beam applications & the FDA should recognise this situation in the case of headlights.

A.18 April 28, 2024 — Hamilton, Canada — Migraine

LED headlights on numerous occasions have given such intense sharp pain in my eyes that induced migraines, forcing me to pull to the side of the road and vomit. Glare from LED headlights has blinded me on thousands of occasions. In some of those instances it has taken more than 5 seconds to regain my sight. LED headlights and taillights physically hurt my eyes when I'm in close proximity to them (I.e. stoplight) forcing me to physically block them with my hand. The glare, blindness, eye pain and migraines caused by LED headlights have been confirmed by my optometrist, Dr. Otto Lee. Among eye care professionals, LEDs are a known and documented problem in every age group. Driving at night for longer than 30 minutes has almost always resulted in me getting a migraine, which was never the case before LED headlights existed. As a result, I have to limit my nighttime driving to less than 15 minutes. This limits how much work I can do, or how much I can visit my family, especially in the winter months. I've had to restructure my life around LED lights.

A.19 April 28, 2024 — Lancaster, PA — Migraine

I am a migraine suffer, and my trigger is photosensitivity, especially from intense bright lights. For the last several years auto makers have installed LED headlights and the color temperature they have chosen to use is blinding for oncoming drivers. There truly is no need for the adaptive or “moving part” of the headlight if ya warmer color temperature is programmed into the LED headlight. The extremely intense and blinding colder “blue” white light emitted from LED headlights just feet away is MORE dangerous than looking up at the sun. If focused intense cold bright white light is not dangerous why do welders use masks? It is literally the same reason and effect these OEM LED headlights have on oncoming drivers. How many people need to die before LED headlights are given

a warmer light temperature? It is really not that hard. The technology already exists. Just look at the average teenager and how they use LED lights in their bedrooms. They have a small remote and they can change the color and or color temperature of the lights at their will. Thank you for your time.

A.20 April 28, 2024 — Los Gatos, CA — Astigmatism

With the increase in use of LEDs in car headlights in addition to cars raised too high (or their headlights tilted too high), driving on the roads at night is an incredible hazard. I commonly find myself unable to ascertain details of what's going on behind me with traffic and the position of other objects/cars when faced with these blinding lights. I have to get creative to even be able to see, and still face blind spots due to these stupidly bright lights. It makes driving dangerous and I can't believe LED lights in headlights didn't get banned years ago.

Every day the government allows this is increasing the likelihood of accidents, health issues from staring at these lights and just a generally worse quality of life.

A.21 April 28, 2024 — Marshfield, WI — Astigmatism

LED headlights are blinding to the point where I have almost hit deer and other vehicles because I cannot see when the LED lights are coming at me

A.22 April 28, 2024 — Milwaukee, WI — None

I am blinded by the brightness of the LED lights not only at night, but during the daytime. Even from a car behind me glaring in mirrors during daylight. Making it dangerous for me to drive. My eyes cannot adjust due to the brightness. I've swerved off the side of the road. Had to pull over. Which is not always possible when there's traffic behind you and traffic coming at you. This is a problem. There should be a limit on the brightness of the LED. This is such an easy thing to fix, but for some reason nothing gets done.

A.23 April 28, 2024 — Onsted, MI — Astigmatism

I get eye pain and headaches by being exposed to 4500K or higher led lights Whether I am driving at night or during a sunny day I am constantly shielding my eyes from led low beam headlights, running lights and brake lights. I have to adjust my side and rear view mirrors so I cannot use them to see properly to avoid being dazzled by led lights. If streetlights are on during the day and night I put my sun visors down because the leds are too bright. I drive over 1000 miles a week for my job. I dread cloudy, rainy days, dusk and night driving because of led lights. It's like torture to my senses. I am constantly blinded at night and have been during the day as well because of led headlights. If I am walking in a parking lot on a cloudy day I have to shield my eyes because led running lights are too bright. I have asked my neighbors to shield their outdoor lights or use softer 2700K led and it has caused me civil lawsuits and many legal problems do to this simple request. I have to wear dark sunglasses inside of places that have led lighting. I never had eye pain or headaches prior to led lights. LED headlights are the most dangerous aspect of driving by far. These lights have ruined normal day and nighttime activity for me were they are present.

A.24 April 28, 2024 — Ottawa, Canada — Migraine

I am very sensitive to many things, including light and sound. I loved to walk a lot at night when the lights used Halide orange/pink lights. Now that the city has been switching out the Halide lights with super bright LED white street lights my walks are much less enjoyable. It feels like I'm walking around in the day time. I don't understand this obsession people have with lighting the world up like a giant football stadium. It's not necessary, it's not pleasant, it messes with your circadian rhythm. In my case, it can cause headaches and light fatigue. It also hurts our environment. Birds, animals and insects cannot follow their natural rhythms because their environment is so bright at night now. Also, while driving, I'm blinded by headlights that use these horrendous white LEDs. I hope there is an invention of filters for the lights that are currently on vehicles and that it is enforced to add the filters to the headlights. A return to a golden soft colour would be preferable. As well as adding golden/orange filters to street lights and/or a different design that mimics old styles and colours of street lights. I really hope the government begins to regulate this. It's dangerous for the environment, people's health and eyes as well as creating an ugly world to look upon.

A.25 April 28, 2024 — Webster, MA — Other

Large pick up trucks as well as SUVs and other cars especially in MA., were it seems that tailgating is legal, get behind you and blind you from behind making it very difficult to see ahead of you. Same situation with vehicles approaching from the opposite direction.

A.26 April 29, 2024 — Irvine, CA — Photophobia

I have photophobia and photosensitivity due to multiple autoimmune conditions, and my life has changed significantly for the worse with the introduction of intense blue-white LED car headlights and the (ongoing) replacement of a large (about 16000) number of HPS lamps with LED fixtures (at correlated color temperatures of 3000 K and 4000 K) in my city (Irvine, CA).

Street lights: Bright exposed LED street lights of any color, but particularly those above 2700 K, pose a health risk and serious disability barrier for me. Being sharp and pointed sources of high glare and discomfort, they can exacerbate my dry eye symptoms (I have Sjögren′s syndrome) and the likelihood of an autoimmune flare-up. As a SLE (lupus) sufferer, I need to keep my daytime exposure to sunlight limited. It used to be that nights were my go-to option for long strolls, a drive to the grocery or restaurant, or a chance to bask in moonlight or stars at night—something that the gentler glow of shielded HPS lamps afforded. Over the past decade or so, and particularly in 2024, most of these basic human comforts have been taken away from me. I have pleaded with city officials to undo the damage and the discriminatory barrier that street lights cause me, and despite their efforts to mitigate a small portion of the damage (I have met with a very modest degree of success) via glare shields in my immediate neighborhood, the city at night is becoming a cheap, vicious display of human sensibilities and human compassion gone awry.

Headlights: Vehicle headlights with blue-white LED lights piercing into one′s eyes from oncoming traffic are the stuff of nightmares—poorly-angled, egregious beam patterns pretending to be ″safety features.″ Even five minutes′ exposure to this type of rampant glare while I drive or sit in a passenger′s seat is sufficient to bring on severe eye pain and vision disturbances, headaches that last days, and emotional distress. It is appalling that those objecting to these ill-conceived and risky fixtures are not taken more seriously.

Light pollution is a menace not just to humans but also to wildlife and foliage that suffer without shutters. Researching, designing, and implementing options that are conducive to safety and easy on the eyes must be high on the agenda, an urgent societal cause.

“So benumbed are we nowadays by electric lights that we have become utterly insensitive to the evils of excessive illumination” — Jun′ichirō Tanizaki, In Praise of Shadows

This evil is eradicable; let’s do what it takes.

A.27 April 30, 2024 — Auckland, New Zealand — Migraine

LEDs cause me to suffer hemiplegic migraines of three day duration. This has resulted in partial confinement to my home, exclusion from municipal life, partial loss of employment and deterioration of health. The migraine results in blurred vision, dysaesthesia to the left side of my face and left arm with severe occipital pain. It has resulted in loss of consciousness on multiple occasions, one of which leading to a three part fracture to my right arm.

A.28 April 30, 2024 — Roseville, CA — Autism

I was standing in a room and another person’s cell phone buzzed with a message notification. The iPhone also pulsed its LED camera flash, which struck me in the eyes. I fell to my knees, breathing hard, and trying to fight off a panic attack.

A.29 April 30, 2024 — Swanage, England — Other

LEDs have been fitted as replacements for low pressure sodium street lights in the area where I live, which is within the Dorset Area of Outstanding Natural Beauty and immediately adjacent to a National Nature Reserve. The CCT rating of the LEDs that have been installed here is 4000K, which results in an eerie blue-white light which I find most unpleasant. The glare from the new lights is excessive, to the extent that when I walk beneath them I have to look down at the pavement rather than looking forwards along the road, to keep the lights out of my field of view. The light spill from these lights is excessive, resulting in the blue-white glare of the lights penetrating the windows of my

house, which makes the interior of my home feel unwelcoming. I find that the light penetrating my home negatively affects my sleep quality, even though I have blackout blinds on my windows (the light still penetrates around the sides). This light intrusion was never a problem when the lights were low pressure sodium, as the orange glow was quite restful and not at all disturbing. My view across the Nature Reserve at night is now compromised by the new LED street lights, which produce an incredible amount of sky glow. My home is just 400 metres from the coast, so there is often mist or fog in this area, and these LED street lights cause the whole area to light up as the light scatters in the mist. It is exceedingly unpleasant. One of the lights is 185 metres away from my house and is over ten metres below it, yet the street light casts a bright image of my window onto my bedroom wall. It is so bright it appears as if a car is parked on the hillside with its full-beam headlights directed straight at my house. I have been so disturbed by these lights over the past two years that I believe my current condition of ophthalmic shingles (herpes zoster ophthalmicus) was triggered by them. I have been suffering photophobia, nerve pain, a facial rash with blistering and acute inflammation of one eye because of this condition, which has resulted in the hopefully temporary loss of useful sight in that eye. Since I am otherwise fit and healthy and have had no other stress to cause this condition to appear, I firmly believe that it is a direct consequence of the installation of LED lighting outside my home.

May 2024

A.30 May 1, 2024 — San Leandro, CA — Astigmatism

I regularly walk home from work in the evenings, which in the colder months means walking down a dimly lit street. Having poor eyesight and balance, I'm always afraid that the blinding headlights of the cars zooming down the street will cause me to stumble off the sidewalk and into the path of an oncoming car. It certainly doesn't help that some cars have headlights bright enough to leave afterimages in my vision, the last thing I'd want to deal with when walking at night.

A.31 May 3, 2024 — Amherst, NY — Photophobia

Discomfort, people and sleeping patterns, also disruptive for me from exercising early mornings or evenings with street lights over 2700k

A.32 May 6, 2024 — Cleveland, OH — Autism

LED lights give off a poor quality light, pure and simple. With the cheapening of everything these days, proper fixtures are usually non-existent, i.e., there is rarely any diffusion in the form of a large shade or lens--just the raw diode. For those who have in-focus vision (as everyone strives for with corrective lenses and such), the intensity of viewing a high-powered and undiffused LED at any distance is always an unpleasant one. As it happens literally thousands of times a day, our retinas get "etched" and degraded. This is not to say that an incandescent bulb can't be painful, it's just that in the days of incandescent bulbs we made proper fixtures.

For me, when I'm presented with an unexpected bright source of light, my eye naturally moves and centers it in my vision. There is something physiologically that makes it hard to look away instantly. It literally takes like a complete second to pull your eye away from it. However, the damage is already done. You stared directly into something that was of an infinitely higher magnitude of brightness in relation to its surroundings. THE EYE IS NOT BUILT FOR THIS. These encounters cause a tense visceral reaction throughout the body. Considering that there are BRIGHT LED lights on just about every conceivable object these days, and it's common for someone to have these negative encounters thousands of times in one day, and considering that the center of your vision is by far the most important throughout our lives, the collective pain and suffering is unimaginable.

There's a certain obsession with safety that I believe our society has falsely bought into. For example, daytime running lights used to be a small halogen bulb, perhaps 10 watts. Now, there are cars with many layered stacks of raw LEDs with candela measurements far exceeding our proper range of vision. It is saying that that person's car is the most important thing you ought to see down the road. Animals, pedestrians, everything else, doesn't get to grab your attention. Your vision system is so overloaded with the fact that "there's that car," that other possible visuals are much harder to see. Overall, the eye does not need that much light to see as long as the relative values are thoughtfully presented (as they used to be).

Nighttime is all but a faint memory as it is almost always ruined by the presence of stinging, streaking, damaging, high candella artificial lighting. We, as a species (and all species living in our vicinity) have lost a cherished and peaceful time; the hours of darkness that we once called, and still hypocritically call nighttime.

I don't believe that our nation should have any real discussion about mental health until we face the reality that we're degrading each other's eyes, our most important sense, on a grand scale.

People are literally suffering and slowly dying from the continued assault on their eyes, and thus, their brains.

A.33 May 9, 2024 — Saint Paul, MN — Photophobia

My eyes have retinal injury and bright LED lights cause intense pain and discomfort. Overly bright LED's impact my life in numerous ways. There is widespread illegal use of intense LED floodlights in my neighborhood, but the local law for legal use of LED floodlights is not enforced. LED streetlights seem designed to blind drivers, rather than illuminate streets. Streets are dimly lit, but streetlights are shine right into drivers eyes. Vehicles keep their headlights on day and night, and shine into sideview and rearview mirrors. This causes eye pain and discomfort.

A.34 May 10, 2024 — Yonkers, NY — Migraine

Led lights blind me in the road and flare up migraine. Have to stay home at night. Interfere with my life. Very dangerous.

A.35 May 12, 2024 — Hancock, WI — (no category given)

I almost hit a pedestrian on the side of the street because the car in oncoming traffic had blinding LEDs. I did not see the pedestrian until the oncoming car had passed. If the timing was just a little different, there would have been a terrible ending. I reported it to the nhtsa. They said the lights just seem brighter. (This was a few years back.) I used to love driving at night. Now I can't handle the LEDs. This puts more traffic on the road during the day. Even when someone driving next to me has LEDs, I have to lift my hand to cover my side mirror from letting it blind me.

A.36 May 14, 2024 — Cambridge, NY — Epilepsy

My daughter and I walked out to run an errand one afternoon. As we came around a building, there was an LED streetlamp, still on though it was daytime. I'd been completely fine a moment before, but the light struck me and I was instantly incapacitated by severe neurological symptoms, stumbling and shaking. I couldn't walk, speak or see properly and my face and left arm went numb. We turned back immediately, and my daughter had to hold me upright so we could get away from the light as quickly as possible. We did not complete the errand. About a week later it happened again. This time i was alone, and my impression was that the street lamp snapped on as I got closer. This time there was no-one to catch me. I fell and couldn't get back up again. I was nauseous, dizzy and disoriented, unable to see, my limbs uncontrollably hitting the ground. Eventually I crawled/dragged myself back home and remained ill for many hours. I felt humiliated on top of everything else. I do not know if anybody witnessed what happened. Nobody came to help me and I could not call for help because I couldn't speak.

A.37 May 14, 2024 — Chicago, IL — Other

blinding me and seeing spots all day. extremely stressed when i have to drive!!!!! I hate these lights and cannot believe this is legal!!!!people don't give a crap!!!

A.38 May 14, 2024 — Sammamish, WA — Autism

I have largely avoided walking around my neighborhood at night for quite a while because of extremely bright LED headlights, except for viewing the aurora borealis on May 10, 2024, and I was horrified at the growing rate my neighbors are installing very bright LED light bulbs that far exceed 2700 Kelvin. I had to walk to darker parts of the neighborhood to avoid my view being ruined by the glare of LED lights. Even while walking around at 3 in the morning to view the aurora without seeing a single car with LED headlights, I was subjected to extremely intense blue-rich white light LED radiation from many homes along my usual route. I was honestly hoping the solar storm would knock our power out, which didn’t happen.

In addition, I witnessed many poorly shielded LED lights without any diffuser at many stations along the newly opened Line 2 Link Light Rail in the Seattle area and was horrified at how these LED lamps are a potential discriminatory barrier. We always talk about diversity and inclusion here in the Seattle area and making transit accessible and yet never consider the needs of those with autism or epilepsy. I've even noticed that many buses by King County Metro (and likely Sound Transit) are now being fitted with LED headlights.

Banning incandescent bulbs is a crime against humanity and an attack on nature itself. We need very strict national light pollution laws instead of doing this at the local level. Or better yet, unban incandescent bulbs and let the customer choose instead of the government doing it for us.

A.39 May 18, 2024 — Houston, TX — Photophobia

While visiting a friend I was exposed to LED from overhead light fixtures in the apartment, and the extreme LED of Samsung TV. Together, they suddenly triggered photophobia, migraine, & brain fog in me and I am not a TV watcher. Just walking into a room with LED TV and lightning or shopping in grocery and drugstores with All the LED now triggers my eyes with pain. Shopping mall is out of the question for me. I have to wear very dark sunglasses and a cap with a bill. I Must have phone and other devices Very dark, And have limited screen time. I have to cover lamp shades with scarves. I've tried blue block glasses which don't help at all. Obviously the LED has caused me to be much less social. It has also caused my eyes to twitch, and has made them have intermittent blurry vision.

A.40 May 18, 2024 — Los Angeles, CA — None

LED lights make it dangerous to drive at night because my vision gets blocked while I'm driving a vehicle.

A.41 May 25, 2024 — Portage, MI — Photophobia

Debilitating headaches, dizziness and seizure like response when exposed to LED lighting. Increased sensitivity to any lighting type after prolonged exposure in LEDs.

A.42 May 27, 2024 — Avondale, PA — None

Unable to see the road, cars, or surrounding areas while driving when high beam LEDs are in use. Lowering these LEDs to regular or low beam does no use. Even in low setting these LEDs are 10 times brighter than my vehicle's regular incandescent lights and my eyes cannot adjust to account for dark adaptation to drive at night. Ban LEDs in vehicles or reduce them 75% to match other older model vehicles. Also - point them downwards so they light the roads instead of tree tops and telephone poles.

A.43 May 28, 2024 — Bangor, Northern Ireland — None

I see that because the Prime Minister has declared there will be an election in the UK, the petition for the issue to be debated has been declared null & void..... Raging ! The reflector size of dipped headlights gets ever smaller, increasing the intensity of dipped headlights - a triumph of style over function !

A.44 May 28, 2024 — Kuala Lumpur, Malaysia — Photophobia

Instant trigger of chronic migraines. Can't even function at all.

A.45 May 28, 2024 — West Springfield, MA — Other

Driving home at night from visiting my daughter and grandkids, my partner and I who are in our late sixties were constantly bombarded by LED lights. He was behind the wheel while we both kept aware for the usual zig-zagging speeders and with warm weather, motorcycles (why aren't they required to have a red light or reflector on the back of their helmets?).

It's like running the gauntlet having white/ blue blasts of light dazzle you from opposing traffic. Even on highways with wide median strips you never know when you will be temporarily blinded! There is construction everywhere, lane shifts, narrow temporary lanes with rough pavement and confusing signs and then those lights, sometimes from packs of cars all with LEDs hitting your eyes. Trucks or SUVs behind you and your rear and sideview mirrors are useless! You have to fiddle around, while driving to tilt the side mirrors or literally drive with a hand up blocking your rear view. This affects all

ages but is particularly bad for seniors! Older eyes have slower dilation response to glare. In a way it's age discrimination as older people will have to think twice about whether they can go out at night!

We have laws prohibiting people from shining laser lights into the sky as it can blind pilots in airplanes. This is the same thing. We worry about folks distracted by their phones or impaired by alcohol, but no one thought about super bright lights glaring in your eyes!

This impacts my life. It's dangerous! They should be recalled immediately. Like other car malfunctions manufacturers should change out the lights or put a filter on them. Let's do this now, not in 10 years or so. Switch back to halogen for the safety of all drivers.

A.46 May 28, 2024 — Winsted, CT — Other

Dangerous driving conditions at night on my way home from work!! I have to literally close my eyes as ridiculously bright LED headlights blind me while passing in the other lane. This is so dangerous and damaging!!!!!!!!!!!!!! How can this not be being addressed. I have almost crashed multiple times. I feel my eye sight is being damaged from these lights and getting worse. Please help up.

A.47 May 30, 2024 — Brighton, England — Migraine

My life has been devastated by LED lights. I am severely triggered by LED lighting, especially car headlights. I experience extreme migraine for up to 2-3 days after looking at a car headlight or a LED strip light, depending on duration of exposure. LED panels in shops, buildings and street lights make me very ill also.

I can be vomiting for 6 hrs or more after exposure and have severe head pain, weakness and complete disability. Consequently I am now pretty much housebound and excluded from all social activities, travel and work. I have tried all the blue light blocking glasses but it is the FLICKER that is the trigger. In the same way strobe lighting affects people with epilepsy.

It is totally unacceptable that so many peoples lives have now been pretty much ruined by ubiquitous LED lighting.

A.48 May 30, 2024 — Jaffrey, NH — None

Being the director of a public library which offers evening hours, I regularly need to drive the 1/2 commute home in the dark. I also help care for my 93 year-old father, which again requires night driving. I am not elderly, do not wear glasses, and just passed the vision portion of my driver's license renewal. I have no health issues that would make night driving difficult.

The new LED headlights have made night driving extremely dangerous for me and by extension, anyone else I encounter on the road. I am literally blinded by the headlight intensity of both the oncoming traffic and the cars behind me if they have LED headlights. I studiously attempt to not look at the oncoming cars with LEDs, which means I don't have full visual scope, but as I live in a rural area, cars can come from around corners or over hills before I know where exactly to focus my eyes to avoid direct contact; thus I am constantly dazzled. If I accidentally have even a momentary direct eyeline contact with LED headlights, I have a blinding afterimage that lasts for several hundred yards. There are no shoulders on the rural highways I travel, so I cannot pull over until my blindness passes (and I would have difficulty seeing the shoulder after exposure anyway). If a car behind me has LED headlights, the glare in my rearview and side mirrors can interfere so badly with my ability to see that I sometimes have to turn all the mirrors away so that the glare is targeted elsewhere--very dangerous, if not illegal. The LED light from the car behind me is so intense, I could easily read a book if stationary. I have begun wearing special yellow glare-reducing glasses to drive at night, but as they reduce and darken my overall vision, this is risky.

I cannot cease driving at night if I wish to remain employed. I cannot cease driving at night if my father is to continue to receive my care. I don't wish to cease driving at night and limit my ability to freely live my life simply because all new cars have ridiculously blinding headlights. The invention of LED headlights has created a real problem in my life, and the danger of an accident is real. There doesn't even seem to be a justification for their widespread use, which is additionally maddening.

I have limited my comments to the issue of safety re LED headlights. In other areas, I also find LED light has reduced my quality of life (I can no longer see the night sky due to neighbor outdoor LEDs, etc.) and am outraged that I am given no choice in the matter of home lighting. For decades, I have

line dried all my laundry in an effort to energy-offset my continued use of incandescent lightbulbs. Now it is illegal to sell incandescent lightbulbs and I am consigned to having to spend every night hour of the rest of my life illuminated by light that feels like nails on a chalkboard to me. That rant can wait for another day.

Please take complaints regarding LED headlights seriously. They are TOO BRIGHT. How many accidents will need to happen before this is addressed? I know I feel like an accident waiting to happen unless I cease driving altogether, which is not an option and shouldn't have to be.

Thank you.

A.49 May 31, 2024 — Logan, UT — None

Our city has a 'suggested' policy of dark sky compliance where often they will cheap out violating EISs for various road projects. I successfully had a 'cobra' style HPS light typically used at interstate interchanges removed from near my home due to light pollution. Now on the street the rest are being phased out for Dark Sky Compliant (DSC) LED lights and it is a wonderful change. The light is diffuse, lights up the sidewalks, and has minimal spill onto homes or the street. A new hotel has been built across the street from us and the owner incorporated Dark Sky Compliant LED lights in the parking lot and surrounding and it is only slightly more bright at night than before, and it is safe for the hotel guests. I'd recommend making formal comments to Beaverton City to mandate future construction to be DSC and incentivize retrofits to meet DSC. Glaring lights are only slightly less annoying to me than sound pollution, but I've worked with our city to address both.

June 2024

A.50 June 1, 2024 — Fairfield, CA — Autism

During the day, I was driving a vehicle on a freeway when I struck by an LED flashing light from a bicycle on a parallel road. I reactively closed my eyes and then suffered a seizure reaction, which I would describe as like an electrical shock and loss of cognitive functioning and vision. I then had to emotionally fight off a panic attack.

A.51 June 3, 2024 — Oakland, CA — Other

blinded by oncoming headlights and totaled my car (1-17-2024)

A.52 June 4, 2024 — Cumberland, MD — Migraine

I have spent many hours trying to block the harsh alien light that floods our house since the LED streetlight has been installed in front of our house. It is summer now with leaves on trees. The light will be even more intense and be on for longer times in the winter. When I step onto my porch in the evening I am blinded by the LED streetlight and it is difficult to leave the porch without the risk of tripping on steps. I no longer take evening strolls because of the blinding glare on our streets. When I do walk at night, I get red spots in my vision and suffer headaches. I have had several panic attacks while trying to sleep. I feel that these have been triggered primarily by the oppressive feeling that my home and home life has been severely impacted and there is nothing I can do about it.

A.53 June 4, 2024 — Petrolia, CA — None

At night when an oncoming car or especially truck has LED bright lights, I stop right where I am. I can't see to move forward lest I drive into the oncoming vehicle or drive off the road, hit a tree or down a hillside. This happens frequently in the rural areas. In town, I cannot see pedestrians or even signal lights when the headlghts are aimed at me. It makes all the other features like crosswalks and parked vehicles disappear. Certain headlights are a danger and I'm glad I haven't had an accident from being blinded by them.

A.54 June 5, 2024 — Doylestown, PA — None

The LED lights are like Searing Laser High Intensity Lights that BLIND the drivers visibility and harm my eyes with pain and headaches. There is no avoiding them, I find I have to shield my eyes anytime one of the LED vehicles come toward me on the road. It is Impossible at night to drive and extremely difficult during the day I suggest going back to a softer headlight and putting an AMBER shield on vehicles that have LED lights to soften and stop the blinding that they cause or best go back

to the softer traditional lights. It is IMPOSSIBLE to drive at night and will eventually lead to burned out retinas and macular degeneration with this constant blazing brightness directly in the drivers eyes.

A.55 June 5, 2024 — Escondido, CA — None

As I walked into my local Costco, I was assaulted by an LED demonstration light. Immediately I got a headache and my vision turned blurry. Even after getting past the light, the effects lingered. As I walked down the first aisle, another demonstration light hit me, with the same result. I spent the rest of my time shopping under duress. I spoke with Jose H., the membership manager, and explained how dangerous those lights are, especially to people with neurological sensitivities, that they can cause seizures and worse, and requested that they be turned off. He said he couldn't do anything. He would have to confer with the corporate office.

A.56 June 8, 2024 — Brantford, ON, Canada — Photophobia

I am blinded by LED headlights while driving. This is extremely unsafe. LED headlights should be banned.

A.57 June 12, 2024 — San Tan Valley, AZ — Migraine

It literally feels like it is burning my retinas. I no longer feel safe driving at night. It's not safe for me or others. I don't know what to do. I feel like I'm going crazy.

A.58 June 12, 2024 — Tampa, FL — None

I recently visited a local establishment for lunch and every single one of their lights had 5000k (maybe even higher) bulbs in their fixtures. The color wasn't the only problem, but they clearly used some cheap bulbs with a very low CRI and a terrible flicker rate.

I'm normally not *that* sensitive to bad lighting, but this place in particular immediately triggered a full migraine and a feeling I can only describe as nauseating. I looked up pics on Google maps and years ago this place had nice warm lighting and used Edison style incandescents. Makes sense that I had no ill effects the last time I was there.

A.59 June 14, 2024 — Havre, MT — Other

The Bureau of Reclamation, a federal agency, is conducting a three-to four year construction project near our home. They are using high-intensity LED lights on the site. Our home is over one-half mile away from the site and 100 feet higher in elevation but the construction lights are projecting into our home, lighting it up from end to the other, and have been doing so since the summer of 2023. We have been asking them to modify their lights since August of 2023. When I started having daily migraines in December of 2023, we started blocking some of our windows with cardboard, but the damage turned out to be far worse. A few months ago, my husband was diagnosed with a sudden and drastic change of vision in one eye which alarmed his ophthalmologist, who was unable to find any physical reason for the loss of vision.

A.60 June 21, 2024 — USA — Autism

An individual contacted the Soft Lights Foundation to report thoughts of suicide due to repeated exposure to blue-rich LED lights such as vehicle headlights. The neighbors called the police who came out for a welfare check. The police stated that only the city council could do something about the LED lights.

A.61 June 29, 2024 — Hillsboro, OR — Other

My partner and I are blinded by LED headlights that drive behind us these days. It is getting worse. WE ABSOLUTLY HATE IT!!! It's unsafe and poses a safety hazard. LED Headlights are basically high beams. At least "high beams" have regulations on when they can be safely used.

July 2024

A.62 July 9, 2024 — Mangonui, New Zealand — Migraine

While traveling in the passenger seat along the state highway felt sudden thunderclap pain to the left occiput passing three flashing LED lights on three diggers repairing the road. My left eye began to

stream, my speech became slurred, then dysaesthesia to the left side of my face and arm occurred. I felt as though I had a concussion. The symptoms of this hemiplegic migraine event resolved gradually over a three day period.

A.63 July 9, 2024 — Woodland, California — Autism

A fire truck came down the street with LED strobe lights. The strobe lights caused me to suffer psychological trauma which lasts for hours after the incident.

A.64 July 15, 2024 — Albuquerque, NM — Autism

I am Autistic and have a sensitivity issue with BRIGHT LIGHTS. My city has changed their streetlights to LED 3000k and 4000k lights from streets to parking lots. Ever since these lights were installed, I have been getting constant migraines and large headaches multiple times a month. My city is REFUSING to do ANYTHING to bring back ANY form of AMBER streetlights. I've contacted the city AND state A LOT! And they won't do anything. I've even tried contacting the DOT of the state and he won't even be much help. My city continues to IGNORE my concern and also continues to install these WHITE LEDs. I've tried EVERTHING I could to help my city but they won't do ANYTHING. I hope I can FIND a way to FORCE my city to bring back these AMBER AND VAPOR streetlights back! My city had installed these lights back in 2019 and I've done EVERYTHING I could to try and make the city understand that these lights are TOO BRIGHT, and I CANNOT continue much longer going to bed every night and waking up every day with a LARGE MIGRAINE that causes me to even become DIZZY at times! I hope you can help me fight this issue in my city and FORCE my city to bring back AMBER AND VAPOR streetlights! Thank you for reading this!

A.65 July 16, 2024 — Albuquerque, NM — Migraine

When I am too close to these white LEDs, I tend to get a large, massive migraine and then I start to lose control of my senses. I become extremely quiet and my friend that I stay with has been noticing that I would act strange and also tend to get a little violent with him. Again, I have NO control of my senses when I am TOO CLOSE to these bright lights! I end up basically not remembering anything and my friend is telling me like, "why were you acting like that??" And I first did NOT know what was causing the problem, until I figured out that when I am REALLY CLOSE to these white LEDs, I tend to start getting that migraine and then lose complete control of my body! I currently am staying with my friend and where he lives, the city is refusing to take matters of these issues that SOME of the residents are experiencing SIMILAR symptoms. My friend who is Autistic will get really painful migraines! And he'll take WAY TOO many painkillers to try and stop his headaches. Before the city of Albuquerque changed their streetlights to white LEDs, my friend and I have had NONE of these issues. After a few months of these leds being installed in the city, Me and my friend had started to get these strange symptoms and they have only gotten worse! I've personally contacted the state and city's legislature and administration regarding this problem. BUT they don't want to do anything about the problem! My friend has contacted the whole state PLENTY of times explaining that this is extremely dangerous, but again, they do NOT want to do anything about it! I'm hoping that somehow, we can make Albuquerque replace their led white lights to a softer light like, 2200k HID LEDs and also MAYBE some LED VAPOR lights! I hope you can help force Albuquerque to do this!

A.66 July 17, 2024 — Sacramento, CA — Autism

I was driving on the freeway in the slow lane, when a tow truck in the fast lane ahead of me suddenly turned on LED strobe lights on the top of his struck. It felt like a lighting bolt when through my body. I instantly closed both eyes and felt like I should drive off the bridge.

A.67 July 24, 2024 — Blandon, PA — Other

I had an LED come downhill at me with high beams on while I was driving. Despite having light blocking glasses on, and being in my car behind my windshield, I still managed to suffer a temporary vision injury. For several minutes following the car passing me, I had a GIANT hallucination of an oval of light, with regular sight in the dead center, in both eyes. It was my first time experiencing this, and after the second minute I had begun to think it may be permanent. The experience was terrifying, I was over an hour from home, and so emotionally distraught on top of the vision impairment that it was difficult to maintain stable driving.

A.68 July 30, 2024 — Federal Way, WA — Other

LEDs cause me so many neurological symptoms brain fog, anxiety, depression, OCD, headaches, ghosting (ex. When looking at led tail lights and looking away I see them but it's a ghost appearance that's green) , lose my place when talking, visual accomdation spasm trigger, disconnect feeling, nausea. It's been a nightmare with LED lights. Some are worse than others.. especially ones using PWM as their brightness control which induces flickering. Car headlights are the WORST. I can see the flicker of most led headlights it's very uncomfortable.

August 2024

A.69 August 1, 2024 — London, United Kingdom — Other

Council lawnmower with flashing LED lights drove past me while I was walking along the road. I felt immediate severe head pain, nausea and discoordinated, and fell into the roadside ditch. I then vomited, climbed out with blurred vision and pounding head.

A.70 August 1, 2024 — Mangonui, New Zealand — Migraine

After accidentally (I have to avoid exposure to the direct beam of the LED) viewing a small but powerful security light for less than a second, I had to violently throw up for up to two minutes at which point I lost consciousness and fell to the concrete floor and hit my head. I woke in a pool of blood and further vomit. The security light has been turned off so I am safer in my home but unable to go anywhere with LEDs safely. I am now registered disabled and struggling to maintain my work which now has to take place at home. I have had several severe episodes where they have caused me to have seizures that can take months to recover from. I now experience up to 3 led induced migraines as opposed to once every three months prior to the roll out of LEDs. If I look briefly look directly at an LED it damages my vision and I am left with spots in my vision for hours to days. If spending time in spaces lit by LED I can find it hard to think clearly, I am unable to speak clearly and cant remember words. this also happens when I have a migraine with aura set off by a strong LED. My life has changed in every way imaginable since they where rolled out in my location around January 2021.

A.71 August 2, 2024 — Portland, OR — Photophobia

I am 40 years old, and I cannot see at night when faced with LED headlights (can see fine when they are not present). I have been told by 4 eye doctors that there is nothing wrong with my eyes and I have no condition to warrant a diagnosable handicap. Because I cannot see at night, ESPECIALLY in the rain (here in Oregon we get 9 months of rain per year), I am forced to get rides from others or not drive at all at night. This significantly impacts my job opportunities and my income potential. I am incredibly stressed out because of this and do not understand why no government agencies are taking action on this problem. I plan to pursue further lobbying activities or and/or legal action.

A.72 August 3, 2024 — Acton, MA — Sjogeren's

Having Sjogren's makes it extremely difficult to see with oncoming cars with unregulated LED headlights. They make it impossible to maintain any degree of driver safety. I must focus on the right edge of the road to be certain there are no pedestrians walking on the side of roads in the suburbs and country. Leaving the left side of my car exposed to the driving skills of the offending driver, which does not follow the defensive driving skills I was taught and use whenever I am in the driver's seat.

The other issue I encounter are the extremely bright blue LED lights on police cars when I approach the scene of an accident or when they pull are car over for a driving incident. Even when driving at 2-5 miles a hour to be cautious not to hit anyone I cannot see what's in front of me. Their blue lights put me at risk of hitting a pedestrian even when driving at 2-5 mph.

Why should my passengers and my safety be put at risk because of unregulated LED lights? If it has not already happened, this will lead to many lawsuits with the automotive manufacturers throwing the weight of their legal teams defending themselves when the regulation of LEDs would have prevented the injuries and loss of life.

A.73 August 3, 2024 — Austin, TX — Other

I have early cataracts. The LED headlights blind me, whereas halogen lights do not impair my vision at all. At a minimum adaptive driving beams should be required in the US like they have been used in Europe since 2012.

A.74 August 3, 2024 — Bellevue, WA — None

Interestingly, I believe this is also an issue for people with very good vision and not wearing glasses like me. The lights can focus very well onto my retina and make me uncomfortable looking forward at night, but how can people safely drive cars without looking at where the car is going? Due to the strong headlights in new cars, I simply avoid driving cars at night now.

I live in Greater Seattle Area where it's mostly cloudy over the year, and the sun sets very early in winter. Some of these LED headlights are so bright, it's even a pain for me driving around noon during day time. As a paradox, Daytime Running Lights should promote road safety, but they do act as a safety hazard on some cars now. This video should demonstrate my point well: (https://www.youtube.com/watch?v=s4Ws0__yiXg)

Thanks.

A.75 August 3, 2024 — Canaan, NY — Astigmatism

The LED headlights are a hazard.I'm still fairly young and have had to give up driving at night completely due to how unsafe it is getting blinded by them and not seeing the road for several seconds afterwards. I, like millions of others, have astigmatism in one eye, but I also have had migraines triggered by these lights, even during daytime driving from drivers with headlights on! My optometrist and doctor's office staff have stated that many other patients report similar issues. The internet is full of forums with people complaining about these lights, and their accounts are very similar - if not even worse - than mine. It's astonishing and reckless that these lights are being inflicted on the driving public!

A.76 August 3, 2024 — Chicago, IL — Photophobia

EVERY DAY BLINDED AND SEE SPOTS VISION IS DECLINING EVEN IN DAYTIME!!!!

A.77 August 3, 2024 — Chicago, IL — Astigmatism

Bright LEDs make it hard to drive at night. It's blinding and unsafe for me and the public. Sometimes sunglasses help but I shouldn't wear those at night

A.78 August 3, 2024 — Fort Collins, CO — Other

At 74 and having cataract replaced and it is nearly impossible to drive safely with the blinding blue white glaring LED lights. It is so distracting and frustrating I loose my concentration to drive properly. The lights seem to bounce up and down with a blinding flashing impact. Even police vehicles red and blue flashing on the side of the road are so blinding it is difficult and unsafe to go around them. I can't see what is in front of me. The contrast from dark to blinding flashing lights is too much to see what's in front of me.

A.79 August 3, 2024 — Fountain Hills, AZ — None

Apparently the plan to get drivers off the road is working with the BLINDING LED vehicle headlights. The police LED flashing lights are SUPER BLINDING.

A.80 August 3, 2024 — Fresno, CA — Astigmatism

Why do we have dimmer switches on our cars' headlights if intensity doesn't matter?

As a person with astigmatism I just had a conversation about these lights at my ophthalmologist's office as several of the office staff were nearby and joined in. All agreed these lights are so blinding, especially to those with astigmatism, and it creates a driving hazard. We all opined that they need to be regulated because they said they see problems with them across the board with their patients and in their own lives.

I'm also very photosensitive and have to look away from those oncoming lights to not be blinded by them. Should you really have to take your eyes off the road to drive? Does that make any sense?

Again, why do we have dimmer switches on our cars headlights if intensity doesn't matter?

A.81 August 3, 2024 — Glenville, GA — Migraine

They make me have stroke symptoms every time I am near an LED light of any kind

A.82 August 3, 2024 — Greenville, SC — None

Because of super bright LED lights, I can no longer drive at night. My eyes are very sensitive to that horrible brightness and I had to change my life around this problem. I had to look for a job where my schedule is not ending at night. How can this be allowed? All of you know that this is wrong. WHY?

A.83 August 3, 2024 — Hamilton, MA — Astigmatism

Like myself, millions of Americans have astigmatism that makes it difficult to drive at night. LED lights from oncoming cars, esp on 2 lane country roads, make it almost impossible to navigate safely when coming home from work in the winter. I have almost driven my car into a lake after being momentarily blinded by this kind of headlight. While good for the driver who has them, they are DANGEROUS for everyone else using the roads at night. Thank you.

A.84 August 3, 2024 — Hinsdale, NH — Photophobia

I absolutely can't look straight ahead and watch the road when an oncoming car with LED light comes toward me. I actually turn my head to the right a bit so as to not get blindness. If I do look at them, I see dark spot in my vision, just like a dark shadow that blocks the road. I also get migraines and have come home from driving at night very upset because I realize my migraine is most like due to the bright lights. I have to limit my driving at night unless it is necessary. It is a danger to me and others to be on the road at night. Please help with this scary situation.

A.85 August 3, 2024 — Onsted, MI — Astigmatism

Led headlights (low beams) , white led running lights, LED brake lights, emergency flashing Led lights and Led streetlights have adversely affected my ability to drive safely. I do not drive at dusk or Night anymore unless I have to (for work). I live in Michigan with snow covered roads and the most dangerous aspect of driving is being blasted by someone's Led headlights. I cannot use my read view or side mirrors anymore because of the vehicles behind me blinding my visions with their Led headlights. I have to constantly shield my eyes to be able to see the road due to oncoming Led headlights. I love nature and now my ability to enjoy the Night skies is ruined because of bright Led lights on at night. I never had any problems driving at night prior to Led headlights. Now driving has become a nightmare and a very dangerous task. Led headlights should be banned or at least some type of regulation regarding luminance and Kelvin temperature. Many Led low beams are much brighter than halogen highbeams. In addition to the dangers of led headlights being dangerous, they cause me headaches and eye pain. It's common knowledge that blue light is detrimental to the health of humans and don't understand why this type of lighting is being used in the public.

A.86 August 3, 2024 — Portland, OR — Other

A few years ago I was driving on Hwy. 211 in Oregon near Molalla at night when I encountered a pickup truck with LED (BLINDING!) lights headed toward me. The glare caused me to be blinded to my lane from the oncoming LED lights, and there was a deer I did not see until after the pick up truck passed. That was too late. Although I was not hurt, the deer could have crashed thru my windshield; I have seen this before. My car was "totaled".

A.87 August 3, 2024 — Riverside, CA — Other

Retinal retention where bright lights blind and the retina holds the image

A.88 August 3, 2024 — Rochester, NY — Astigmatism

LED lights have caused a multitude of problems for me since there general use. I'm blinded by LED headlights making it impossible to see after they have passed. LED lights in and on public buildings have resulted in headaches and migraines. LED streetlights makes driving difficult as it does not give diffuse light pole to pole. LED streetlights in a snowstorm create a dazzling reflection making orientation of the road impossible. LED strobes on emergency vehicles, construction vehicles and

personal vehicles have induced seizure type symptoms. Driving at night and being exposed to LEDs cause sleeplessness

A.89 August 3, 2024 — Yonkers, NY — Migraine

Headlight blind me. I cannot go out at night even for dinner with friends without being blinded and triggering migraines. I have better than 20/20 vision and these newer headlight blind like like the older ones never did. They really limit my quality of life. I went out for dinner with friends in the evening in July and was so blinded on the way home that I barely got home. I got a severe migraine lasting several days.

A.90 August 4, 2024 — Kittatas, WA — Astigmatism

I have had to stop my car entirely when driving at night because the lights were so blinding. I literally can not see and choose to stop my car in the middle of the road for everyone's safety. I don't have this issue with all the headlights. For some lights, I do use my hand to shield my eyes from the headlights. I had to do this over the weekend once again. I have noticed that when I use my hand to shield my eyes I feel heat on my hand. This weekend's incident stood out because I had the a/c on in my car and I could still feel heat on my hand from the on coming headlights. I have also noticed that my left eye, the eye that gets the most direct LED light, has been slowly getting worse.

A.91 August 4, 2024 — Spokane Valley, WA — Epilepsy

The use of LED lights in public spaces has and continues to become a more and more serious issue as more and more are being used and lights are being switched to this. In department stores like Walmart, I can only be in there for about 10 minutes max and it sets off my epilepsy. I get nauseous, and dizzy and begin to have auras. I have to immediately go outside to natural light. They are being used as street lamps and at night with it already dark outside, it makes them that much more awful for people like me. They are being used in headlights and I made a serious note of this when my son and I drove to Denver and back from WA. If there was oncoming traffic at night and older cars with older style headlights, there is no issues driving at night. Sure they are bright and you always have a little of that bright headlight thing going on, but those new LED headlights are just obnoxious beyond belief. Not only are they bright, but when you get a row of them and you have epilepsy - they flicker, and some flicker noticeably because when it is temperature change ie colder they seem to have an issue and cause flickering. As a person with epilepsy you only have the instinct to close your eyes and you can't because you are driving the car. Same with going down a street light with LED street lamps. And while I get that if you have epilepsy and they say don't drive. I CAN drive, and DO have my license and it is unfair to me to take away my license because of some light bulbs!!!! When I am otherwise allowed to drive. In my recent drive to Denver and the flickering head lights - some were almost to a point of flashing like an emergency vehicle. How on earth is that even safe for any driver encountering that in the dark at night? It is visually distracting like a strobe light. And then finally - I can not even have lighting in my own home or my office any more. You have completely gotten rid of any light bulb that a person with epilepsy or a person with strokes etc can use in their own home and using those ones that change the lighting tone from natural lighting to bright lighting really doesn't help sorry. So what do you expect all of us to do? Go back to only lighting our houses by candlelight? You, as the FDA need to LISTEN! I am in architecture and interior design, I am well aware of design and lighting. This is a very REAL issue that needs to be looked at. It is a health/ medical concern. My mom recently had a serious of mild strokes, and upon researching it since I have epilepsy - I discovered that strokes including decreasing blood flow to the brain CAN because by LED lighting! Before this is dismissed as a whim, you need to actually look at this. It is a real problem. If I go in to Lowe's or Home Depot in their lighting section I can last about 2 minutes and I have to go running out of there and want to throw up it is so bad. I used to love their lighting section - even just a couple years ago it was still ok because not all the lighting had been switched out yet - there was still a balance. Today I can make it about 2 minutes - you want to tell me that is not a serious health concern? I am just one person out of millions with epilepsy, strokes, migraines..... This effects a lot of people - not a handful. On my same adventure drive to Denver the other day - we stopped at hotel and stayed the night. When I came to the reception counter, the woman behind the counter had the lights above the counter area turned off. So I asked her about it and told her I had epilepsy and just wondered if she did and that's why she had the lights off. She told me that ever since the hotel had switched to the new lights, she can't keep them on any more. that she had a car accident and now had

a serious stigmatism that caused her migraines. The new lights make it so bad she gets sick and can not be around them at all so she had no choice but to turn off the lights just to be in that space. The FDA needs to listen - it is a REAL problem! Thank you

A.92 August 4, 2024 — Webster, MA — Migraine

When the migraine sets in after just ONE oncoming LED vehicle I have much trouble focusing my eyes back on the road. Especially on darker back roads which I travel to work on in the early morning and also have trouble focusing at work.

A.93 August 5, 2024 — Beaverton, OR — Migraine

Poorly designed LED lights impact my health severely. Flickering LED lights induce migraine headaches, and this affects my health nearly every day. Overly bright LED headlights and street lights impair my night vision and make driving more dangerous.

A.94 August 5, 2024 — Bradford, England — None

I walk my dog along part of a busy road, the car LED lights are so bright coming toward me that one night I did not see a bramble which hit my face leaving blood running down my face!

A.95 August 6, 2024 — Culver City, CA — Other

I have to hold one hand w/ a newspaper, and bring down my visor, the rear view & side mirrors to block all LED headlights. This makes it very difficult to see any traffic hazards. If the light does hit my eyes, i get a piercing pain back to my optic nerve worse than a migraine.

A.96 August 6, 2024 — San Diego, CA — Other

Honestly, this is an issue I must deal with EVERY time I have to drive at night! There are far too many outrageously and dangerously bright headlights that blind me and so many others I know. Whether it's headlights that haven't been positioned correctly, or large vehicles beams that shine directly into my review and side mirrors, either way it's awful! In order to drive without being blinded nonstop, I must flip my review mirror up, and use my left hand to block my drivers side mirror. This GREATLY reduces my safe usage of these needed tools, but I have no choice. I either do these things or be completely blinded by these eye scorching beams. I can recall when there were warnings against looking into these LED beans when flashlights started using them, and now, we are forced to be blinded by them WHILE DRIVING!!!

A.97 August 6, 2024 — Winters, CA — Autism

I was driving on a country road in the daytime. Over 1 mile ahead of me was a utility truck on the side of the road with amber LED flashing lights. For the entire mile, I was either glued to these LED flashing lights, or forcing myself to look away. As I approached the truck, the LED strobe lights were overwhelming and I could not see through the lights. I stopped my car in the road and started to panic. I put my hand in front of my right eye, and then tried to use my left eye to navigate around the truck. It is impossible for me to think or see with these LED flashing lights blasting me and I suffer extreme anxiety and panic.

A.98 August 7, 2024 — Knoxville, TN — None

Excessively bright, unshielded lights are being set up over the city, some residential, some commercial. Despite being against code, the City does not effectively address the issue. Lights close to my home leave me and my neighbors blinded to own properties, as well are problematic for drivers. I am literally unable to look across my lawn when they are on, as the glare is blinding and painful to my eyes (I have no eyesight issues), meaning I cannot see anything. They're also an ecological catastrophe. It is unbelievable these lights have gone unregulated this long.

A.99 August 7, 2024 — Valley Stream, NY — None

LED headlights are incredibly irritating and they've become far brighter than is necessary. Not only are they absolutely blinding in some cases but they're DISTRACTING, and I can't imagine what could be worse on the road. Headlights should be sufficient and shouldn't pose an issue for other drivers. The fact that they do risks lives every day!

A.100 August 9, 2024 — Jefferson, OH — Other

I have worked with injurious light emitting devices for 15 years. The act of being forced to look into high powered led arrays has been a continuous thing for me and at least a few other people at work. This has increased to a ridiculous glaring issue, and nobody seems concerned about. I became more interested in all of this recently when i noticed a sort of hole in my vision where if I look at something for a few seconds it just starts to go black. A common daily routine for me involves taking measurements thermal and electrical measurements of several very high powered lights in the space of a meter that output 72,000 lumens pointing up at my face, my face is less than 2 feet away. I was not given proper PPE and had to ask for it, then i received improper ppe, and by way of my own ended up using a shade 5 ppe for welding.(which is still not good enough because the stuff hurts my eyes also there appears to be zero science in choosing the right ppe for staring into injurious light) I am confused about what ppe to use for reading meters while viewing intense light. I went to the optometrist, and he claimed my eyes did not seem damaged, suggested i am experiencing some sort of photo bleaching and said that they will be damaged and he recomended that the company i work for should seek a safety hygienist. But like i said stuff disappears if i look at it for a few seconds a plus i seem to experience mental problems while being around these intense lights. I have read through all the regulations and shortcomings of various federal regulatory bodies and i just don't know where to start besides letting the safety coordinator person know my problems. I have not done that because i want to make a clear case and show everyone what is really wrong. That and i don't want to end up being ignored or dismissed.

A.101 August 12, 2024 — Queen Creek, AZ — Electromagnetic Sensitivity

My wife started to develop dizziness every time she would go inside of a newly opened Costco near our home. When she would arrive home, she would be nauseous and have to rest for a while. Now, she struggles to go there alone because of how being in the store makes her feel, and usually needs someone to go with her. The lighting in the store is the bright white LED type. Very agitating to the eyes. Not sure if there's other factors at play, by the lighting is definitely an assault on the eyes. When I go in there, I'm in and out pretty fast because the lighting is so stressful.

A.102 August 14, 2024 — Goodyear, AZ — Migraine

I have migraines that get triggered from bright lights from light bulbs and sun glare. I used to be safe from this affliction at night, but that hasn't been the case ever since LED headlights have become popular. I now feel that I have to wear sunglasses at night as well as during the day to avoid what feels like the unabated light of the sun from traffic from the opposite side of the street or from trucks who tailgate me for not going 80 mph on the freeway. I am essentially left blind and with a burgeoning migraine every time a passing car shines their lights at me, and I am certain I am not the only one who suffers from this.

A.103 August 15, 2024 — Round Lake Park, IL — Photophobia

I have had glasses since I was 10 years old and am now 31. After reaching my 20s my eyes leveled out and my prescription did not change for over 6 years. In the past year and a half I have worked from home on a computer. Between computer screen and the blue LED headlights my prescription went from -3.5/-3.75 to -4.25/-4.25. Even more recently for 2 days my left eye experienced a 'halo' effect when looking at lights that worsened at night. Thankfully it went away after a few days, but 2 opthalmologists couldn't determine the cause. Driving at night is an increasing hazard due the brightness headlights, especially the LED ones. There does not seem to be any regulation on how bright headlights can be and all the LEDs make it difficult to see the road when there are oncoming and they leave a lingering effect on my eyes after they've gone. I have order my new prescription with blue light filter lenses to lessen the effect of headlights and screens. Those special lenses seem to range anywhere from an additional $30 to upwards of $100 on top of the cost for the frames themselves. And that was on a cheap website like Zennioptical.

A.104 August 16, 2024 — Middlefield, OH — Migraine

I went to my bank while it was closed on the weekend to get money from the ATM, but there were so many LEDs that I had difficulty making out the buttons, I felt disoriented, and quickly started to have pain in my eyes and head, resulting in a low grade migraine. I had difficulty responding to the passenger with me in the vehicle and making quick judgements while driving afterwards. I had a

headache the rest of the day and into the next day after the couple of minutes at a machine to access my funds.

A.105 August 19, 2024 — Marietta, OH — None

I work mornings mostly, which means I'm on the road when it's dark out. Every led that passes me or gets behind me blinds me. Most times I have to stare down at the middle line to make sure I'm still on the road. Even dark dirt road my cars yellow brights work just fine. There's no need for someone to light up the whole state of Ohio

A.106 August 22, 2024 — Rocklin, CA — Autism

LED headlights, along with increasing levels of aircraft noise, have literally taken away my ability to live independently.

I was diagnosed with high functioning autism when I was 17 and one of my symptoms is a high sensitivity to light and noise, which is common among autistic people.

I worked as a mechanical engineer in the San Diego metropolitan area for about 3 years after graduating college in 2020. During that time, I was with a long-term girlfriend and was even living with her for the last year of my time there. While living in San Diego I was getting more and more anxious and overwhelmed to the point where I wasn't able to function enough to keep my job or be a good partner with my girlfriend. Eventually, I had something akin to a nervous breakdown and I am now living at home with my parents and working at my local grocery store (thank god I have loving parents who are willing to help me out).

I believe that the exponential increase in recent years of both LED headlights and ceaseless air traffic over residential communities were the main cause of my anxiety. As an autistic, I need to live in an environment that's a sensory safe space (dim and quiet) so that I can recharge from the stimulation of a full day in the hustle and bustle of life. When there's aircraft noise penetrating my room and LED light every time I drive, there's very little break from the overstimulation. If I'm not able to get this recharge time, the sensory overload causes a cumulative effect, and anxiety builds in me.

While living with my parents, in an area with much less air traffic, I've been able to work reduced hours and limit my nighttime driving. I'm starting to see my mental health improve. However, I still have to be careful not to drive for more than 15 minutes or so at night and I mostly have to stay indoors where I can control the lighting and noise levels.

I used to love exploring at night. In fact, I would often go out during the nighttime because this was when the noise of the city quiets down and I feel more comfortable. It's not fair that the world is taking this freedom away from me by creating an unnecessarily harsh environment for sensory sensitive people. I also used to love camping for similar reasons (it was an escape from the noise of the city), but the proliferation of aircraft have taken this escape away from me as well. I have done a lot of brainstorming and can think of several ways that we could make our world more sensory friendly without significantly reducing quality of life for neurotypicals, such as reducing brightness / adding diffusers to LED lighting, enforcing common sense vehicle noise laws, and creating no-fly zones over designated sensitive areas.

A.107 August 23, 2024 — Monroeville, PA — Autism

I am unable to focus when I drive at night due to LED headlights. I had zero issue driving prior to their introduction. Even during the transitional hours of morning and evening sometimes these headlights are too bright. I am blinded to the point that I see afterimages of the lights in my eyes even without directly looking at them as if there were many tiny suns on the road.

A.108 August 24, 2024 — Crawfordville, FL — Epilepsy

Hi! I was diagnosed around 27 with epilepsy, cataplexy, and narcalepsy. It is a rare condition. I am now 52. I lost my license to drive at 27 bc I had a grande mal seizure front the sun shining down through the trees and as I drove thru them the light would blink and next thing I had totaled my car. I noticed that the sun was a problem to me around the age of 16. Wearing sunglasses doesn't really help much. I am very sensitive to the light. My favorite thing to do is shop. The LED lights in the stores have now even made it to where I can not shop if they have the newest led lighting. I know what stores to avoid It will actually make me very sick if I go into a store w led. I'm not sure to tell you if I

am shaking but I do know I get very confused and I will pouring with sweat. It almost paralyzes me. I can barely move or walk. I recently was in Big Lots where I had my last episode less then a week ago. I'm begging someone to listen. I will even have my mom record an episode and send it to you. Many people are affected by this. I want to be the voice that gets heard. I am literally begging to make this lighting go away so I can safely buy groceries.

A.109 August 28, 2024 — Esparto, CA — Autism

I was driving and encountered a utility truck with both sets of headlights turned on. I turned on my non-LED high beams in the hope that the driver would turn off the high beams. Instead, the driver turned on amber LED flashing lights that incapacitated me. I was unable to proceed forward and stopped my car. Instead of driving off, the driver of the utility truck stopped also. My vision and cognitive abilities were severely impaired, with panic setting in. Finally, I started to inch forward, and then so did the utility truck. It seems like the driver was doing it on purpose. After he left, I spent several minutes simply stopped in the middle of the road, trying to breathe and let the panic subside.

A.110 August 29, 2024 — Christchurch, New Zealand — Sjogren's

I was driving and came to a set of roadworks where I had to stop at some temporary traffic lights. I was the car in the front of the queue at the light. There was a worker's utility vehicle parked right behind the light in my line of sight. It had its rapidly strobing lights on. I am unable to function if I look at strobing lights due to neurological and eye symptoms from my common autoimmune condition called Sjogren's (for example Sjogren's impacts an estimated 3-4 million people in the U.S.). I do not have trouble with sunlight or incandescent lights, but LEDs are painfully glaring to me, and strobing lights cause even worse disability. In the incident I am describing I had to block my eyes with my visor and arm, which meant I could not look at the traffic light and I had to wait until the car behind me tooted so that I could know when to drive on. Even then I had to do so VERY slowly as I had to keep blocking my eyes as I went past the strobing vehicle and there was a danger I could hit a roadworker.

A.111 August 31, 2024 — Madison, California — Autism

I was a passenger in a car. As we approached a roundabout, a truck with white LED lights, the circular ones near the bumper, struck me directly. I screamed profanity and began crying. The other 3 passengers all confirmed that the light was excessively bright. For me, however, it was severe emotional trauma. The after effects are very long lasting.

September 2024

A.112 September 1, 2024 — Novi Sad, Serbia — None

Dear FDA Representatives,

I am writing to bring to your attention a serious health concern I have experienced with MacBooks manufactured after 2022. All MacBooks purchased after 2022, including the MacBook Pro M2 Max, cause severe eye pain, muscle tension around the eyes, and migraines. These issues occur when using macOS, with symptoms appearing almost immediately upon using the device. I sustained a severe eye injury during testing, limiting my work time to 40-minute intervals. Even a year later, I cannot work for more than 8 hours a day. Despite consulting several ophthalmologists and specialists in binocular vision disorders, no significant issues were found, and all professionals confirmed that my eyes are healthy. My symptoms disappear when I stop using MacBooks and switch to other devices that do not use Temporal Dithering. There is a clear connection between my symptoms and the use of Temporal Dithering technology in MacBooks. More information on this technology can be found on the following forum: https://ledstrain.org/t/temporal-dithering. As further evidence, MacOS users who managed to disable Temporal Dithering no longer experience headaches or eye pain: https://ledstrain.org/d/2686-i-disabled-dithering-on-apple-silicon-introducing-stillcolor-macos-m1m2m3. I am deeply concerned that in the future, I may be unable to use any Apple device, compromising my rights and ability to work.

I urge the FDA to regulate the use of technologies that involve pixel flickering for color display in Apple products. Your intervention is essential to ensure that sensitive users can continue to use Apple technology safely and effectively.

A.113 September 2, 2024 — Zwolle, The Netherlands — Migraine

Hello, im am not able to use any screens that use dithering and low frequency of PWM. With in use of a product that use these technologies it will give migrenen instantly. I am really conserd of the future because more screens are made with this technology. I have 3 kids and for so long i can i will not let the use devices that use PWM on los frequency and dithering. It will do damage on the long run. For now there is to low attention for this problem and i hope senserly that in the near future this will be widely known.

A.114 September 3, 2024 — Deptford, NJ — Photophobia

I tried to shop at the Five Below in Deptford NJ on Almonesson Road. I only needed one item, I hadn't been in this particular Five Below before. I barely lasted 5 minutes in there before migraine symptoms started, even with the protection of my FL41 tinted sunglasses. The LED lighting is so intense it completely overwhelmed any protection. I was fine when I entered the store, but within minutes I felt nausea and the beginnings of the familiar headache. I had to rest for a few minutes in my car where it was dark, just to recover.

A.115 September 3, 2024 — West Deptford, NJ — Photophobia

This is an ongoing problem. For the past few years I have been unable to shop at the local Shop Rite ever since they doubled or even tripled the amount of lighting above the checkout lines. I get migraine symptoms within minutes even while wearing my tinted glasses and a wide brimmed hat to bloc much of the light. The lighting is that intense. I get visual distortions, nausea, and the Pain starts in about 5 to 11 minutes (I've timed it) I can no longer shop at my local supermarket. The manager I spoke to had callous disregard for my condition, and my emails to management have received zero replies of any kind. Other Shop Rites aren't nearly this bad. The Glassboro location recently remodeled and installed DECENT, HUMAN LIGHTING that doesn't bother me at all. Why cant all supermarkets do this? There is some financial damage from this: I've been paying the higher prices at Acme because I can stand the lighting, or driving the 16 mile round trip to the Glassboro location just to feel human when I shop, so thats extra gas and miles on my car every time.

A.116 September 5, 2024 — Keene, NH — Other

Driving down a tree lined road at around 6 PM (dusk) there was a vehicle stopped in the oncoming lane with their lights blinding me. As I slowed down and continued on my side, I saw a headlight blink. That was the only warning I had that there was someone in the road. I slowed down to a crawl, and the driver was out walking around their vehicle with the driver's side door wide open into my lane. If I continued going the speed limit (30 MPH) I may have hit the driver or at the very least hit their open door. I was able to stay calm driving home, but when I got home 10 minutes later and realized how close I came to possibly killing someone (because the LED headlights were blinding me) I had an anxiety attack, including shortness of breath, racing heartbeat, and a feeling of doom. I already only drive as strictly necessary because of these lights, and this incident further fuels my fear of these headlights causing me to get into an accident.

A.117 September 12, 2024 — Moorhead, MN — None

When driving on roads with multiple lanes last night, I turned my driver's side mirror out and flipped the tab on my rearview mirror because the headlights around me were causing me physical pain and making it nearly impossible to drive. I couldn't see the road in front of me when the headlights were reflecting from the mirrors into my eyes. After adjusting my mirrors, I couldn't see anyone on my driver's side without turning my head, and I couldn't see well behind me in my rearview, but I felt like a much safer driver with those changes because I could actually see the road in front of me.

A.118 September 14, 2024 — Vacaville, CA — Autism

I was driving at dusk when a fire truck or ambulance suddenly appeared with LED lights flashing. I immediately threw both of my arms in front of my face and hit the brakes to stop the car. I thought that this might be the end of my life. The LED flashing lights are sheer terror and I can't function. After the fire truck/ambulance passed by, I felt like I was going to cry from the emotional trauma. My brain then feels like it's dead even hours later.

A.119 September 16, 2024 — Kensington, MD — None

I have personally side-swiped a pile of debris on 270 that was jutting into the lane at highway speed that was **invisible** because of oncoming LED Headlights almost taking out myself and my family. Luckily it just scraped up the side of my car. On other occasions I have barely seen pedestrians on the street who were completely shrouded in darkness because of the contrast these ultra-bright lights create outside of their dazzling beams. I often find it very difficult to see the road markings or the actual profile of an oncoming vehicle because the only thing visible is the floating white ovals in my windshield.

A.120 September 16, 2024 — Nashville, TN — Other

I have Mast Cell Activation Syndrome. My body produces an allergic reaction to things that wouldn't normally cause anyone else a problem, including LED lights. My brain interprets the rapid flashing light as if there's something attacking my body, resulting in what we call a "histamine dump." Histamine dumps lower blood pressure. But given I have a condition known as Postural Orthostatic Tachycardia Syndrome, which already gives me low blood pressure, the combination of this condition with MCAS histamine dump causes me to go into hypovolemic shock. It causes the worst pain I've ever known, where my brain is screaming for oxygen and nutrients, fading in and out of being hyperaware of how much pain I'm in only to dissociate from it as a way to protect myself from the mental anguish of that pain. I've almost died from this several times. For almost a decade, I exhibited symptoms of hypovolemic shock at the end of nearly every day, only to be told it was a cervicogenic headache or migraine. Now that I'm diagnosed, I'm on a medication to treat it. But that medication isn't strong enough to counteract the effects of extremely bright LED headlights, let alone LED streetlights. Every time I leave the house at night, I get sick. I'm already disabled my multiple chronic conditions. My life is already limited. I don't know how to live life unable to even go outside at night.

A.121 September 16, 2024 — Shippenville, PA — Migraine

On August 27, 2024, my husband took me to an appointment with a Neurologist/Headache Specialist at the Cleveland Clinic at their Brunswick location. On the ride there I had a few minor hits from LED headlights which caused a migraine. While at the doctors office I was met with LED lights throughout the office. I got a severe migraine and a tingling feeling in my face. It made the visit with the doctor very difficult as I was unable to come up with the right words to describe exactly how the LED lights are effecting me due to the cognitive loss I had from the LED lights. During this visit it was stated by the Neurologist that LEDs are a common trigger for migraines.

A.122 September 16, 2024 — Shippenville, PA — Migraine

I was riding in a vehicle with co-workers as I am unable to drive because of the LED lights. I picked my head up to look around because we were in the woods when the vehicle in front of us hit their breaks and the lights came on and caused an immediate migraine. Note that the vehicle that caused this was a government vehicle. I had an aura and severe cognitive decline that lasted for hours. Also had a numbness feeling on the left side of my face around my eye and nose.

A.123 September 17, 2024 — Easton, CT — Electromagnetic Sensitivity

My neighbor keeps her very strong LED lights on over her garage all night long from 7 p.m. to 7 a.m. and I cannot sit in the room where their light shines into my kitchen area. I feel sick and nauseous. I feel there is a very strong connection with the LED and frequency that is generated by the towers, wifi-routers, smart meters on their home and my home since I cannot have it removed. I place a date in this form but it is daily I am subjected to these harmful energies from the LED. The bright light is a light trespass into my private space.

A.124 September 20, 2024 — Raleigh, NC — None

Headlights on newer cars make daytime and nighttime driving a constant safety and health risk. These weaponized devices are a clear violation of my rights.

A.125 September 21, 2024 — Shippenville, PA — Migraine

At the dance studio. A parent had suv running outside while child took class. So they were sitting not driving with the headlights on full (low beam). Plus there was this weird strip of running lights

wrapped the headlights and the grill. The lights were more white and not as purple as most. So the hit seemed a bit less. I know to not look up or towards the door. I always put up a hand by my eyes to block and avoid grazes. I've had troubles with headlights coming in the door historically. In which a seizure was triggered (in front of children). So now I always keep my head down and walk on the one side of the building to avoid the door to the outside. This door is a full see through business type glass. As I walked along the "safe" side of the building. The led headlights reflected off an interior (glass see through) door (it was at a slight angle), and hit me in my left eye, mostly. Part of the right eye. Instant reaction. Blink reflex. Yet couldn't open eyes. Couldn't walk. Felt short of breath. Almost threw up. Stood in a veg state for several minutes. Couldn't respond to anyone's questions despite hearing them. Slowly I pulled myself back to the world after 5 min or so and was able to walk away. Sat down. Couldn't do any of the work I was working on. Organizing and cleaning the teacher shelves. Etc. Couldn't even finish the task I started. Barely made it through our team meeting. Couldn't think or filter my thoughts and words. I had severe pain on left eyebrow felt like an ice pick stabbed in. Yet felt like a bomb went off in my brain. Pain was so severe. Eyeballs hurt. The clarity of my vision decreased. Couldn't read fine print like I usually can. Left side if my face went numb. Size of my fist of an additional throbbing pain around my eye socket. I got super super super cold. Started shivering and had goosebumps. I have an apple watch. My heart rate skyrocketed at the exact time I got hit. And continued to be high for 20-30 min. But the worst was immediately following the hit. When hit by LEDs I struggle to sleep at night. It's like my brain is sooooo tired and sore but it's wired. Electrified. I can't sleep no matter what I do. Yep this happened. Couldn't sleep well at all. Today I have a massive migraine. The whole left top side of my brain is beyond sore. Can't touch my scalp. My eyeballs are killing me. Left area around the eyeball is pulsing in like mini pulses. Quick but defined. I can't think. I can't come up with the right words. Im so tired. This is all because a led headlight reflected off a glass door.

A.126 September 25, 2024 — Anytown, VA — Other

In night time car headlights are blinding and the state does not allow you to tint windshield.

A.127 September 26, 2024 — Idledale, CO — Migraine

LED headlights have ruined my life by being the primary trigger of my migraine headaches. I never had migraines until these awful lights became common place. I can no longer drive at dawn, dusk, or night, and have frequently had migraines triggered by LED headlights during the daytime. I can't even stand the light from my own LED headlights and wish there was a way to replace them with halogen bulbs. Unfortunately my new car was pounded by hail shortly after purchasing it, or else I'd get rid of it in a heartbeat. When will these dangerous headlights be outlawed. As it is the auto industry and lack of action by Congress has forced me to stay home and limit my activities at night. I consider this discrimination.

A.128 September 27, 2024 — Bar Harbor, ME — Migraine

Have had migraines since youth, worsened by post-concussion syndrome in young adulthood. Construction vehicles, night driving, and even LEDs at pool facilities are intensely disruptive. Most recent example was a construction firm pickup with blinking yellow/white at 6am. Has seared my retinas for days and increased sensitivity to other lights. I already have to live with enough avoidance of crowded noisy places and entertainment venues due to strobes and music- LEDs make avoidance near impossible and driving potentially hazardous.

A.129 September 28, 2024 — Denver, CO — Other

This report is for many different incidents as I don't feel like submitting over 500 different incidences. It's a daily problem, every time I drive I am affected by these lights. There has been times I've almost driven off the road because I simply can't see the road from being blinded. It's absolutely absurd that this has not been regulated. I get migraines from these lights now, it produces extreme amounts of stress, it has made me dread night driving which I work a night job so I'm kind of stuck dealing with it. I've had pedestrians run out in front of my car and I almost killed them because I was being blinded. These are an extreme safety hazard and something MUST BE DONE.

A.130 September 30, 2024 — Westminster, CO — None

Sitting at an intersection with a car on the other side whose lights were so bright that the traffic lights could barley break through the "white out" effect from LED lights. Multiple people (myself included) flashed their lights at the driver in hopes they would turn them off but instead the driver made them brighter. Even if this person was not on the road with illegally modified headlights I come home every night with so many spots in my vision that I am almost blind and it seems to get worse with every repetition, I fear I might loose my eyesight.

October 2024

A.131 October 1, 2024 — Easton, MA — None

There are multiple times, almost nightly, that I would bet my paycheck that certain oncoming vehicles had their high beams on, and I would put on my high beams, only for them to flash their brights at me because I was wrong. I've been driving for almost 50 years and I have always preferred driving at night until the last 5 or 6 six years or so. It just seems as if EVERY oncoming vehicle have the high beams on. I try every trick in the book to not look directly at the lights, to focus on the right side line on the road and I've even purchased a few pairs of night driving glasses. The glasses reduce the glare a little bit, but doesn't help much. Most of the sunglasses I have work, but I can't see the road properly. After an oncoming car passes I have difficulty seeing, have spots etc, that last anywhere between 20 and 55 seconds where I have limited visuals on the road, instead of my usual 100% attention, while waiting for my eyes to adjust. Sometimes after I get to my destination, I realize I have a headache. My first car had two round, sealed beam headlights with incandescent lamps. Only one was functioning and that was plenty of light for me to see and drive. My current vehicle, a 2018 Silverado has more than enough light and projects for what seems like a half mile in front of me. I don't need to see that far down the road!. When I put the brights on, its crazy bright! I don't need all of that light. Things would be a little better if they eliminated to Auto-High-Beam function. Massachusetts drivers complained years ago of the brightness of the State Police emergency lights being too bright, practically blinding you as you were approaching the police cruiser. Eventually after a few collisions and unfortunately injured troopers, they changed the lights to be less intense. I get stressed out when I have to drive at night because of this easy-to-rectify problem with LED Lights being so bright, when they don't have to be.

A.132 October 1, 2024 — Elk Grove, CA — Autism

I attempted to enter a large box store that had installed collections of LED "white" tube lights in the ceiling. I glanced up at these LED lights and immediately felt eye pain. I turned and left the store, knowing that the situation would only get worse if I remained.

A.133 October 3, 2024 — Bethlehem, GA — None

I can no longer drive in what I feel to be a safe manner due to the piercing brightness of headlights. Over the last year they have become so sharp on the eyes that even in the various hours of the morning, dusk night and even overcast days I am forced to stare at the white line in the side of the road. Giant, oversized trucks with these horrid headlights are near perfectly at eye level often times leaving me stunned.

I've had my eyes checked to ensure they're is no damage to them or a condition being developed that's in need of correction. This is not the case as aside from a mild prescription I received a couple years ago, nothing has changed personally.

I've also made mention of the problem to friends and family and ALL agree that it's out of control. My mother refusing to drive at night as well at this point.

It's flat out dangerous to the public and out of control.

A.134 October 6, 2024 — Howell, MI — None

Nice to find out I am not alone regarding this topic Engineers at automotive companies are responsible for what I consider an environmental pollution nightmare. I never had any trouble driving at night until about the past 8 years or so when I noticed the blue LED lights being applied to more and more vehicles. At first, it was only a few vehicles so a bit of a nuisance, but manageable.

Now almost 80% of the vehicles on the road have these super bright blue spectrum LED emitters just blasting out light. I can literally feel the pain in my eyes when these vehicles approach. I started wearing my polarized sunglasses for driving all the time including nighttime. Does anyone know how those lights may be damaging our eyesight, especially at night when the pupil is dilated due to ambient darkness? Come on engineers, do your job! Ask the questions and demand the answers before you release products which can cause harm.

A.135 October 7, 2024 — Augusta, ME — Astigmatism

There are multiple times, every time that I am driving at night that certain oncoming vehicles had their high beams on, and I would put on my high beams, only for them to flash their brights at me because I was wrong. It seems to have gotten worse now that 1. I've been diagnosed with astigmatism, 2. I now live in a town that doesn't have street lights, and 3. I am driving more at night. It just seems as if EVERY oncoming vehicle have the high beams on. I try every trick in the book to not look directly at the lights, to focus on the right side line on the road and physically block out the lights with my hand. I am afraid my myself and the safety of others if I cannot see when I am driving, especially living in the state of Maine where moose are not easily seen in the dark.

A.136 October 11, 2024 — Brooklyn, NY — Other

Causes nervous system dysregulation which impacts motors skills & orientation, migraines, seizures, nausea, ability to digest food, vomiting

A.137 October 11, 2024 — Yolo County, CA — Autism

I was driving East on a County road in the day when a vehicle came towards me with intense, rapidly flashing amber LED lights. I felt panic rushing in and put my arms up to block the assault. Since I now couldn't see the road, I came to a full stop. Then somebody honked a horn. I moved my arms, and saw that the lead truck had passed, but a wide-load mobile home on a truck was inches from the left side of my car. These LED flashing lights are a menace and violation of our civil rights. My anxiety ran high for 30 minutes after the encounter.

A.138 October 12, 2024 — Esparto, CA — Autism

I was driving behind a vehicle when it suddenly pulled to the side of the road. Coming towards us was an ambulance with LED flashing lights. I felt like I was electrocuted and was going to go unconscious. I instantly closed my eyes and stopped my car. After a few seconds, a car behind me honked, and when I opened my eyes, the ambulance was already gone. Now I'm suffering the psychological after-effects.

A.139 October 18, 2024 — Portland, OR — Astigmatism

I thought I could get over it, because LED headlights are so unavoidable. I tried everything I could possibly do to cope. But lately it has evolved to suicidal thoughts, because I feel like I'll never be able to live a normal life again. I was thinking maybe I have autism, maybe I should get that checked out, but I feel ridiculous. Do I really go tell a therapist that LED headlights make me want to kill myself? Is that what I have to do?

A.140 October 20, 2024 — Harbor Springs, MI — None

I can't drive in the morning or at night because of these blinding headlights. This is crazy, worse than drunk drivers. What happened to the Auto Safety industry or safety regulations? I am either going to have to lose work/get fired because of this or literally drive blind and pray I don't die or kill someone else.

A.141 October 21, 2024 — Paoli, PA — Migraine

I have recently started to suffer from severe chronic migraines. As a result, I am photophobic almost all of the time. This makes LED lights not only painful and very uncomfortable when I drive at night, but also dangerous. Whenever a car with LED lights passes me at night, I am blinded for about three seconds. I have to pray that a deer or other animal will not run out in front of my car, especially now that it is deer rutting season and the deer are very active. This is all made so much worse by the fact that many people in my area have new cars, meaning ultra bright or powerful LED lights. I did not have a migraine earlier today, but I may develop one soon after driving tonight.

A.142 October 27, 2024 — Los Angeles, CA — Autism

My partner and I took turns driving from Sacramento to San Diego during the day. For the most part, the drive was without incident. At about 4pm, we were in the Los Angeles area.

First, we witnessed the result of a fatality crash, with about 6 emergency vehicles with red LED flashing lights. I was the passenger, and was forced to shield my eyes from the flashing LEDs. Then I was struck at close range by the blue LED lights on a highway patrol car further down the freeway, causing me pain and anxiety.

Around 5pm, the blue-rich LED headlights started appearing, causing me to have to look out the passenger window. Then the blue-rich LED streetlights started turning on, causing me to flinch with each exposure. Then there were blue-rich LED wall packs and floodlights on my right and left which increased my agitation at each exposure.

As the sun set, we exited on a ramp, and tiny yellow LED flashing lights on multiple curve signs struck me directly at close range. After dark, we were inundated with blue-rich LED headlights, blue-rich LED streetlights, blue-rich flood lights, LED business signs, parking lot lighting, and intense LED red taillights. A commercial truck had red LEDs wrapped around the entire back of the truck.

When we arrived at my my mother's house, a place I know well, I was hyper vigilant. Every light was now too bright. Every light was a danger. Everything was too bright. For the first time in my life, I was unable to greet my mother with enthusiasm. I was in shock.

My mother turned off all but one incandescent lamp, but when she asked me if she could turn on one more lamp, I broke down crying. I am now on edge. I am on hyper alert. Every light is an enemy.

November 2024

A.143 November 1, 2024 — Fresno, CA — None

The lights are so bright now, I hate driving at night to pick up my kids from activities. Now its dark earlier due to time change. It is terrifying. Seriously. Sometimes I just pray I make it. I have flashed before as a reminder the brights are for oncoming traffic. Numerous times they flash back and its even brighter! I get white spots in my eyes everyday. Im buying night vision glasses. Do ya′ll night drive at night or cant see from the back of your limo? What is going on?

A.144 November 7, 2024 — Vacaville, CA — Autism

I was in the city just after sunset and all the blue LED car headlights and blue LED streetlights started appearing. I started to go into a panic. It felt like it was an emergency, so I reached into the center console of my car and found some orange tinted clip on glasses. I put these on over my glasses, and the panic immediately stopped. All of the blue-rich LED lights were still far too intense, but the feeling of life-or-death panic was completely removed by putting on the orange-tinted glasses which filtered out the blue wavelength light.

A.145 November 8, 2024 — Sandpoint, ID — Other

Since LED lights have come out on cars (and especially pickup trucks) I have been unable to drive in the dark. The lights create a halo that fills my entire vision field, making it dangerous to me and others. I cannot see even the side of the road..... Even after cataract surgery. This has caused me to curtail all evening activities. I am retired & live in the country so this is very isolating and causes depression.

A.146 November 9, 2024 — Point-a-Pitre, Guadeloupe — None

(this is an automatic translation from a non-American language)

Unfiltered LED lights that emit excessive brightness levels and overly white color temperatures, which are harsh on the eyes, have completely disrupted my daily life and degraded my quality of life.

Their widespread and forced implementation for energy efficiency reasons, without any consultation with the general public despite warnings from scientists and health organizations, resembles a dictatorship: "the LED dictatorship."

Nighttime and daytime car lights, public and private lighting, stores, offices, business premises, public transportation, electronic devices, vending machines, etc., LEDs are everywhere and in excess. This overabundance now prevents me from living normally.

Manufacturers and installers have done whatever they want: everything seems designed so that current lighting is more about assaulting our eyes rather than providing proper and subdued illumination.

It is a dictatorship leading us to a dystopian environment for a portion of the population that suffers: "the LED dystopia."

Because of LED lighting and its daily impacts on our eyes:

I have to change my personal and professional habits; I have to flee at night and give up any outings or activities; I can no longer drive at night and stress about being assaulted wherever I need to go; I have lost the freedom to move as I wish; I am becoming socially isolated; I am losing the health of my eyes and fear losing my sight!

Furthermore, I can no longer tolerate seeing and enduring these "light signatures" from cars that cause retinal persistence phenomena or light trails, dangerously obscuring vision.

LEDs have created a real phobia in me: "LED phobia."

LEDs are a nightmare and a missed opportunity to reduce our impact on health and the environment at a time when it is impossible to gaze at the starry sky and biodiversity is collapsing.

A.147 November 11, 2024 — Waterbury, CT — Astigmatism

I am 25 years old and no longer drive after dark. In New England winters, this means 5pm. I drive a compact SUV and am 5′3. Most to all headlights on the road are blinding, and that is from both directions. In suburban and rural areas, the headlights feels exacerbated in strength with often nothing to contrast them. Lift kits aside, SUVs/pick up trucks seem to be eating their veggies and growing in size; their headlights are without a doubt, at my direct head height. There are highways and interstates I have to avoid because the headlights coming from the route opposite direction are too bright. Some headlights even cause reflective mile markers to flare into a ball of light. Too-Bright headlights coming from behind essentially flash bang my rear view and side views. I have driven through construction zones, 3 lanes to 1, at 10mph and been blinded by the work lights, the vehicle lights, even by parked cruisers using rear flashers.

I have never had driving induced anxiety; I have lived across states for college and been a confident driver always. Now a days I am nervously slowed to the right lane when cars are behind me, or hogging the passing lane out of keeping lights out of the driver-side side mirror. I have always had slight astigmatism, and always had corrective contact lens to support that. This year I had to seek out an optometrist because I thought the astigmatism must have worsened. Its actually improved! Both glasses and contacts are still corrected for them. No improvement for driving.

I feel like I really am going crazy over this! I have limited my night driving to short trips/around town. On occasion I have agreed to longer drives, and regretted each time. Its frightening. Its saddening. Its unfair. I hear people say, "people kept high beaming me, I had no idea mine were so bright!". I guess they cancel each other out. I am not faulting the individuals, the newer cars are just, like that. I am not as empathetic for after market installations. But how am I tell the difference?

I am weakened by it all. It seems silly, but its not. My heart pours for older adults who's independence and autonomy are already vulnerable. For pedestrians, who should have the option, ability, and safeguard to walk. For children who ride bikes. I hope to see change, and am happy to know others do too.

A.148 November 13, 2024 — Boynton Beach, FL — Epilepsy

My 3 seizures occurs in grocery stores- Publix and Aldi within a 1 year. I notice, that aura is comes as soon as I walk in the store. I never go there without my good sunglasses (Oakley's works the best so far) on. I change all LED light bulbs in my house to old style light bulbs and fill great. Never had an episode at home since. I drive at night with my sunglasses on, because cars light triggers my seizures as well. LED is epileptics enemy! I have few friends with epilepsy, who experience the same reactions from exposure to LED lights.

A.149 November 13, 2024 — Charlotte, NC — Astigmatism

I am writing to express a safety concern regarding the LED headlights on newer vehicles in the Charlotte area, particularly at night. I have found that the bright LED lights from oncoming traffic are significantly blinding and make it difficult for me to see the road clearly. This has become especially problematic for me now that I'm driving after dark, as I get off work when it's already dark outside.

On multiple occasions, I have almost been involved in accidents because I am unable to properly see the road or other vehicles due to the intensity of the headlights. The glare from these lights severely impairs my vision, and I am now feeling anxious and scared to drive at night because of this issue.

I wanted to bring this to your attention, as it is becoming a significant safety concern for me and I believe it may be impacting others in the community as well.

Something seriously has to be done with these vehicles with that style of lights. SOON!

A.150 November 13, 2024 — Houston, TX — Astigmatism

I am 39. I have been struggling with these high color temp LEDs for several years. This winter seems much much worse. I wear blue light glasses to reduce the effects as much as possible. But these high color temp lights are everywhere now. Headlights. Wallpacks. Street lights. Sports fields. I can barely leave the house at night any more and feel unsafe driving at night. I have never struggled with night driving until these lights. The light exposure creates a piercing experience in my eyes. Then I get agitated wanting to smash every bright light around me. Some days I can get used to the lights in the city if there isn't much contrast between dark and light. But most nights the city is rough as these headlights are now 6000-7000K color temp. Rural driving is painful, especially with the Texas piercing frontage road system where these gas stations and businesses have just hung 7000K color temp wall packs on their exterior walls or canopies. These can be blinding for a half mile. This is no way to live, especially when lower color temp LEDs can provide the same lumens and equal energy efficient results. I know I'm not the only one. And as a taxpayer I would appreciate if Congress would take action on a national simple priority such as this vs devoting their attention to way more complex and controversial affairs. This fix is simple. We used to get pulled over for driving with your high beams on when passing a car.

Please help. We only get one pair of eyes and I hate to permanently damage them or have an accident because we were too foolish to not deploy common sense regarding outdoor lighting color temp and its affect on humans (and plants and animals and light pollution)

A.151 November 14, 2024 — Brookville, PA — Migraine

On November 11, I visited an eye clinic for new glasses, only to find that LED lighting posed a significant obstacle. The clinic had no alternative lighting, so I had to bring my own lamp to examine the frames. Briefly removing my protective goggles to look at the glasses on the display triggered a migraine so severe that I ended up vomiting later and lost another four days to recovery.

The vision exam itself was even more problematic, as the clinic relied entirely on an LED screen for testing. Since I couldn't look at the screen without risking a migraine, they couldn't fully evaluate my prescription. We attempted to use a painting in the hallway as a substitute to check my sight, but the process left my eyes strained, and I struggled to discern any improvement between lenses. According to the clinician, the LED screen is their only testing method, leaving me in a position where getting a prescription update would mean knowingly inducing another severe migraine.

A.152 November 14, 2024 — Mangonui, New Zealand — Migraine

Swimming in a remote lake, 200m from road access, when a car pulled up flashing the red LED tail lights. I felt immediately nauseated and blacked out with brief loss of consciousness for a few seconds. I came quickly to and swam with difficulty back to the shore having developed blurred vision, pain at the occiput, numb left side of face and left arm (hemiplegic migraine)

A.153 November 14, 2024 — Shippenville, PA — Migraine

On Halloween night, despite every precaution I took, I suffered a seizure caused by exposure to blue LED headlights. I've managed to avoid seizures since early spring by being vigilant, especially on Halloween, a night known for overwhelming lights and harsh visuals from costumes and

decorations. I kept all the blinds closed, avoided the front of the house, and even have a canopy tent hanging on my front porch to provide added protection against stray lights.

Unfortunately, someone pulled into my driveway to turn around, and their headlights penetrated both the canopy and my opaque front door, reaching me in the back part of the house. The seizure was immediate and intense, with visual disturbances, uncontrollable shaking, severe pain, and confusion. The following day, I could barely function, enduring cognitive impairment and an excruciating migraine that lasted four days. Despite medication, I suffered through pain-filled dreams and could find no relief. This incident cost me two days of time with my family and two days of work, all because of a brief exposure to LED headlights.

A.154 November 17, 2024 — Bennington, VT — Astigmatism

I have a larger than normal optic nerve in both eyes. I can't really drive at night anymore with the brightness of headlights. Also, any type of LED lights are very hard on my eyes sometimes giving me migraine headaches.

A.155 November 18, 2024 — Lompoc, CA — Astigmatism

I have to turn all my mirrors away to just drive home from school in the evenings. I drive home on Highway 1 and sometimes the LED lights behind me are so blindingly bright I have to pull my car over because I cannot see while I'm driving if there is car behind me with LED headlights. This wasn't an issue for me in the 90's when car headlights were halogen. Please go back to halogen headlights are do something to fix the reflective glare and brightness. Bright LED headlights are dangerous and people are getting into car accidents and will lose their lives.

A.156 November 18, 2024 — Rochester, NY — Other

"Description of LED Incident or Impacts of LEDs on Your Life" ...YES EVERY DAY IS AN INDECENT! I risking loosing my job and my life. Its dangerous...period!

Vehicle, House indoor/outdoor, commercial, street lights et al. Way over the top! Even behind a vehicle the directional and tail lights hurt. I hated these LEDs when I first saw them 20 years ago. Incandescents are now outlawed...thanks big brother...stellar idea.

When is enough enough? Apparently someone must die before anything is changed. Hope it isn't me. This is getting 110% crazy out of control, compounded by this stupid daylight saving time clock changing BS we were supposed to fix years ago. I don't get out of work until 5. Its dark! Then I have to run the gauntlet of deer and on coming traffic melting my skull off my neck with these insane projector headlights. They gotta go and go now.

Night driving is like looking into the sun, it hurts! I've had to ask HR if I can come in early and leave early. They said I need a note from a doctor....gah! I attach a manila folder to my drivers side visor with a big binder clip so I can hide behind it when oncoming traffic approaches. Tell me, how safe is that!

All its going to take is someone making a left in front of me or a deer coming from left to right and pow I'm done! If LEDs were on the red spectrum verses the blue I believe this problem would be much less severe.

OK so I complained. Now whats the next step to actually making the DOT listen and for someone to take action with the auto industry. What can we all do? I signed the petition and had everyone around me do the same. HELP!

A.157 November 19, 2024 — Chicago, IL — None

LED headlights are blinding and I almost crashed because I could not see after driving and having LED headlights directly shining in eyes. It directly impeded my visibility. I cannot drive long distances in the dark because of the strain LED headlights cause on my eyes. I will go home after a 2-hour commute and my eyes will continue to hurt and I believe it is the cause of my headaches.

A.158 November 19, 2024 — Ketchikan, AK — Other

LEDS lights have literally shrunk my world in my ability to find safe places indoors and outdoors In FEB of 2021 the city of Ketchikan altered the city street lights to high intensity 4 to 5000 Kelvin LED lights without shielding or recessed that flooded all sides of my home that has led to a severe drop in

my health. Before that time, I had light sensitivity and now from the LED lights I have phototoxicity which caused my NEW disability They have damaged my CNS, altered and disrupted my cognitive abilities, disrupted my hormones, and have left me in chronic pain

When the lights came on that month, I could feel them instantly. It was like a electrical shock to my system. Since than I no longer get restorative sleep in my home, these lights have impacted my motor neuron part of the brain as well as pituitary, amygdala, hypothalamus, pineal, Insolent, and parietal and vision. They increase my allergy reactions to foods that I had mild reactions to before Leds I wake up to increased blood pressure, (I don't have high blood pressure). Before LED light my fibromyalgia was at a level 2 of pain and now fluctuates between an 8 and 10 on pain scale. This is from chronic exposure to my streetlights. All confirmed by 8 doctors. All these issues within a day to a few weeks are lessoned by 80to 90% when I go to a dark area without LEDS. Some are completely gone.

ACUTE symptoms when exposed to high intensity LED lights especially the flickering. Loss of sight in right eye Floaters, eye pain Extreme sharp pain from front of right eye to back of brain that can last up to 72 hrs (imagine a sharp knife going through your eye to back of brain) Nausea, and throwing up PANIC ATTACKS!!! tremors migraine Spike in blood pressure Immediate herpes outbreak (within hours of extreme exposures} incontinence drooling Severe scalp migraines Blistering of skin and oozing.

What's heart breaking is the fact the lighting industry ignored all the science and medical warnings about LED's especially from 2016 American Medical Assoc warning that they will make people sick. Over 20,000 peer reviewed research on the damming effects of LEDs WHEN WILL YOU LISTEN AND ACT?? Not acting is negligent

LED lights kill and injure and should have never been released to the public

A.159 November 20, 2024 — Marienville, PA — Migraine

When leaving my office, I often encounter an overwhelming amount of LED lights, both indoors and outdoors. On one particular day, the reflection of the sharp, laser-like beams of LED lights from a puddle nearly triggered a seizure. Fortunately, I only suffered a four-day migraine as a result.

The parking lot is especially problematic. The LED lights there create an environment that feels almost hostile both from cars and parking lot street lights. Every time a vehicle starts, its LED beams cut sharply through the area, creating an overwhelming and disorienting experience. It feels less like lighting and more like a physical assault.

On this day, as I navigated the parking lot, I inadvertently came too close to a vehicle that had been electronically started. A brief glimpse of its LED fog light—despite it not being directed at me—triggered severe symptoms, even though I was wearing IR5 welding goggles and red glasses designed to block all blue wavelengths. This intense combination of protection stops the seizures. It does not stop the migraines. The impact was immediate and profound. My face went numb, my eyes involuntarily blinked, and I experienced a deep, penetrating cold, a symptom often associated with migraines. The migraine that followed was particularly intense, accompanied by significant cognitive impairment. Even after resting and sleeping, my brain felt noticeably affected the next day.

(This is part of my report)

When will this madness stop? I just want to live my life without the constant assault of LEDs. I'm tired of enduring their relentless impact on my health and well-being. I just want to live my life safely!

A.160 November 21, 2024 — San Jose, CA — Astigmatism

LED light are always on when it's not appropriate. I drive a small car so there in my direction vision I have to slow down to avoid causing an accident.

A.161 November 22, 2024 — Oakdale, MN — None

Spun out on a snowy day because I could not see lane dividers due to an incoming car's lights. This car was in a highway lane separated from the other lane of traffic by ~100ft and was really not even close to me. I could not see how far the car in front of me was due to the lights of the incoming car and the blinding headlights of the truck tailgating me, so I braked and overcorrected because I could not

even see the lane dividers. Spun out into a ditch. If I were a worse driver or driving distracted I could have easily hit another car and injured someone.

A.162 November 22, 2024 — Springfield, MO — Migraine

After a TBI years ago, I am now a migraine sufferer. I cannot look at the flashing or strobe lights without instant pain. It has been so hard to safely pass by emergency vehicles as flashing and LEDs both blind and cause instant splitting pain. Trying to get by a wreck or incident is really really tough while you are trying go around and not hit people or cars in the road. I have literally stopped my car in the middle of the road at night, even on a curve, multiple times because I was so blind I could not see the road, the other vehicle - nothing! It's as if someone suddenly blindfolded me while driving. How are people navigating this terrible issue? Tonight was a little darker than usual, without a moon, and I was struggling to repeatedly get blinded/see on a long 2-lane rural road. Going over a curvy set of river bridges with rails was terrifying, leaving me blinded for a moment trying to navigate curves. Halfway through the 7-mile trip, the repeated brightness moved to migraine, nausea, and fear I was going to wreck. I was literally wondering what my future holds if I can't drive to see my kids, or even get home from work safely after dark because of these lights. It feels like no one cares - even insurance companies. They HAVE to know; they drive too! Even LED Christmas lights are too much when flashing. We also been blinded by directly placed LED garage lights on houses recently. It's like a direct police spotlight at a T-intersection. I can't see if anyone is coming to the left, due to one homeowners LED beacon staying trained right in my eyes. Tonight, I also made a right turn at a 4-way stop. Because of being blinded mid-turn, I couldn't tell how close the car waiting to turn was in front of me as I rounded to the next road. Not only did I fear hitting the other car right in the door I heard a sickening crunch as my back tire fell off the road edge and hit much further than the wheel rim.

A.163 November 22, 2024 — Washington, PA — None

LED headlights are absolutely destroying the ability for average people in average cars (SOME with major health issues that are now jeopardizing the safety of the person/s) to drive...no matter day or night because the light travels just as strongly when the sun is out. It's forcing people to take action on their own, some using spotlights against the blinding LED's...others using 3M reflective tape on visors and backseat headrests to shine it back in the eyes of the owner. We should not have to do these things. Furthermore, I've noticed an increase in incidents where they keep THEIR highbeams on with total disregard for others while they scroll on their phones or distract themselves in other ways. There is way too much entitlement and a total misunderstanding that these people have when it comes to blinding others. Something needs to be done before every vehicle on the road is equipped with these blinding lights and then we ALL develop vision issues and perhaps even other yet-unknown issues dealing with these lights. I appreciate you taking the time to read my 'rant' but the words stand true with SO many people.

A.164 November 23, 2024 — Camby, IN — None

They've annoyed me greatly the last couple years but this one has been the absolute worst and not getting better. I was driving home at dusk a few days back and was blinded by an oncoming car. As soon as I could see something again, there was a jogger right in front of me. Had to swerve last minute to avoid hitting him.

People are/will be hurt or killed because of these stupidly blinding lights. I can't believe the stock lights are coming out this way. Had both a police car and School Bus blinding me yesterday. Sad & Ridiculous. I feel the day coming that I have to refuse driving at night.

A.165 November 23, 2024 — Hermosa Beach, CA — Electromagnetic Sensitivity

It is painful and dangerous to drive at night anymore due to the extreme brightness and glare caused by oncoming and rearview LED headlights. I have to use one of my hands to physically shield my eyes or use the sunvisor to try to decrease the intensity of the light shining into my eyes. If I use or have exposure to LED lightbulbs at night, I experience headaches and cortisol spikes with delayed or interrupted sleep throughout the rest of the night if I can't reduce the intensity myself (if I am out in a restaurant for instance.) It is clear that there is a problem with the intensity and quality of light we are surrounded with in our modern lives. I hope to see a shift back to light that is more aligned with natural levels and frequencies.

A.166 November 23, 2024 — London, ON, Canada — Migraine

With the increased use of LEDs in many lighting scenarios, it is making it impossible for me to exist in the world. Both fluorescent lights and LEDs cause migraines for me. A mere exposure to these lights for 5 minutes can take me down physically for at least 24 to 36 hours. While it is always a challenge visiting establishments, and lighting my home, those are things I can somewhat moderate. I buy different lights, I just don't go into stores that make me sick. What I cannot avoid, and cannot mitigate, are the increased use of LED in the headlights of vehicles on the road. I can appreciate people wanting to have bright lights for scenarios where the increased brightness will increase safety, but that's why we have high beams on our vehicles. If you're on a country road at night, you turn your high beams on, and then when another vehicle approaches from the opposite direction, you turn your high beams off until you pass each other. You would not constantly leave your high beams on while driving in a city, that is lit with street lights. These excruciatingly bright LED headlights are making it impossible for me to have any independence after the sun goes down, as it is not safe for me physically when driving. Surely the selfish "right" to have the brightest headlights out there just in case you're in a very dark area is a lesser right than what is owed to the general population, let alone those with health issues, to have the right to be safe while driving. Please, please, before someone gets seriously hurt, regulate the type of lighting that can be used in vehicle headlights.

A.167 November 23, 2024 — Sacramento, CA — Autism

I was driving in town when I was struck by a debilitating blue LED flashing light in a store window. I have previously notified the owner of this store twice that I cannot neurologically tolerate the intensity and digital pulsing of this light, but they haven't acted to turn it off.

A.168 November 23, 2024 — San Antonio, TX — Astigmatism

I have to obstruct my own vision to block such ridiculously bright headlights, this is dangerous. I am left with dark spots in my field of vision, much like after staring directly at the sun. How is this legal?

A.169 November 23, 2024 — Yolo County, CA — Autism

I was driving on the highway when a firetruck with red and white LED strobe lights approached me. I could see it about half a mile away. I started to panic, knowing that I wouldn't be able tolerate it as it came closer. I pulled into a parking lot and waited for the firetruck to turn onto another street.

A.170 November 23, 2024 — Zimmerman, MN — Astigmatism

I can't see with the headlights. I'm tempted to put mirrors on my car.

A.171 November 24, 2024 — Bennington, VT — Epilepsy

I was taken to the ER for a medical emergency unrelated to my epilepsy. I've been to this hospital many times over the years to see specialists get health screenings, visit friends etc. My doctor had called ahead to the hospital, telling them about my LED-reactive seizures and how critically important it is that I not be exposed to LED light even momentarily. She told us the head ER nurse assured her the ER staff understood and would treat me in an LED-free setting. My doctor told my husband to remind whoever first met us at the ER when we arrived, just for reinforcement. We got there, he did, the attendant said yes she'd got the message, I was put in a wheelchair and raced inside - right into the LED-lit emergency room. I had on a hat and glasses but I instantly started to shake all over. My husband grabbed the wheelchair and got me out of there fast, leading to a fraught ordeal, trying to figure out how I could be treated for the medical emergency that had sent me to the hospital, without putting me at risk of potentially fatal epileptic seizures caused by the hospital's new LED lighting! Ultimately they managed to set up a treatment area in a back hallway near the ambulance bay, which had large windows and overhead lights which could be turned off. My husband had to push me in the wheelchair around the outside of the building and up a restricted driveway to reach it. If I hadn't been so sick, i would have been terrified that an ambulance would pull up with its flashers going. Thankfully all went pretty well from then on and I was released just in time to get home before the LED streetlamps came on. When I recovered, I called the hospital to discuss the need for a section of the ER and other parts of the hospital complex to be LED-free, clearly labeled, so that anyone with an LED-reactive medical condition can be safely, promptly seen and treated. I asked them to think of it as a disability aid, exactly like the need to have ramps and braille, to consider safe lighting a medical necessity, like being vigilant about dietary restrictions for their patients. The staff member

said they would pass on my request and get back to me in two weeks. Two months later, this is what I was told: The hospital had recently remodeled with all LED lighting and wasn't going to remove or alter any of it. If I have to go there again, for emergency treatment or anything else, my options are 1) call ahead and tell them I can't tolerate LED light 2) Be admitted under the LEDs and when I start convulsing they will give me lorazapam and put me on a lamotrigine drip for the duration of my stay or - if I'm not happy with either of those options - 3) go somewhere else. (Thoughts on those options: 1) My doctor did call first. Luck and scrambling got us through that ER visit, not planning and proper care, plus calling ahead obviously isn't always possible. 2) Do they know I can even take those drugs? Might being drugged interfere with whatever other procedure I went there to have? Will I be able to communicate with anybody? Give consent? And how do I leave the hospital if I have to pass under the LEDs after the lamotrigine drip is removed? 3) We live in a rural area. The next closest hospital is over twice as far away.) Quite the striking situation, isn't it? We're menaced with increasingly frequent medical emergencies, injury, and illness, caused by forced public encounters with demonstrably dangerous LED lights, and we need medical care, health protection and practical real-life solutions more than ever, but safety vehicles and hospital facilities are becoming yet another source of the threat!

A.172 November 24, 2024 — Esparto, CA — Autism

I turned right at a T-intersection and was immediately struck by amber LED strobe lights on an AT&T utility truck. I yelled out profanity, raised my arms to try and block the strobes, closed my eyes, and felt a sudden urge to drive my car straight into the AT&T truck. Instead, I pulled over to the side of the road until I recovered.

A.173 November 24, 2024 — Hickory, NC — None

Can no longer drive at night due to extremely bright LED headlights blinding me. I have no health issues that would cause sensitivity to bright light

A.174 November 25, 2024 — Manassas, VA — Photophobia

This incident occurred at night on November 24, 2024. I wanted to go see a friend who is moving out of town, who lives about about 45 minutes away and most of that is on the highway. I usually avoid driving at night, especially on the highway, but felt it was worth the discomfort to see my friend. The whole way there, donning sunglasses and squinting my eyes, was an uncomfortable experience to say the least, I'm in a low-riding sedan. But the worst part was, after driving 40 minutes I missed a turn, and ended up back on the highway. Then, I missed another turn, ending up on another highway. What a nightmare. I did not ever arrive at his house, because my missed turns took me 25 minutes off-route. I pulled over and cried, then drove home. It was the worst experience I've had with night driving to date.

A.175 November 25, 2024 — Vacaville, CA — Autism

I was driving East on E. Monte Vista Ave. when I struck by the LED flashing lights on an RRFB. Instead of the RRFB making me stop, I start yelling fuck, fuck, fuck, fuck, fuck, fuck as I tilted my head down and drove straight through to escape the LED assault and save my life.

A.176 November 26, 2024 — Montclair, CA — None

It’s blinding me. The cars lights are so bright I have to stop in the middle of the road because I’m blinded by these trucks and teslas with LEDS

A.177 November 26, 2024 — Van Alstyne, TX — Other

I get constant floaters in my vision that last up to an hour. These new LED lights are an extreme hazard to safety. There is no benefit to blinding traffic. It isn't safe for any party involved.

A.178 November 27, 2024 — Lancaster, ON, Canada — Electromagnetic Sensitivity

Screeching tinnitus, organ pain(liver, pancreas and kidneys), needles in the eye pain, extreme pain in bones, cranium, burning of the skin, migraines, worsening astigmatisms, extreme photosensitivity,

A.179 November 27, 2024 — Stratford, ON, Canada — Autism

I'm autistic and have migraines, playing hockey requires a lot of night driving home as well as driving home from my partners place. Due to how bright lights are now, they spike my sensory issues and migraines causing me to lose focus on the road. This was never an issue until the last few years with the spike of LEDs, the yellow tints were so much easier to deal with over the new blue. Even walking at night with my dog, the lights cause no one to be able to see my boy and I even when we are on sidewalks etc. it's awful having to dull down my own life and avoid things after dark just because everyone has sonic beams! It's dangerous as hell for everyone, why is this even a thing!?

A.180 November 28, 2024 — Eatonton, GA — None

Driving on a county 2 lane road I was approached by a late model "tall" pickup truck...that had very bright lights blinding me. I slowed down to 35 mph as I went by this truck. My eyesight definitely got the "halo effect"...a deer was standing dead ahead in my lane just as I got past the truck. Didn't have any chance of avoiding the deer. Front bumper got crunched inward...front grill destroyed...and the AC condensor coil ruined. Damage estimated at $2,400. I could not afford full insurance coverage as my vehicle is 20 years old. (My car looked and ran very good). Too many people just don't dim headlights for courtesy sake anymore.

A.181 November 29, 2024 — Middle Village, NY — None

Every time I get in my car, I am blinded by car/truck LED lights. So dangerous...literally can't see. Why is this allowed? Who is responsible?

A.182 November 29, 2024 — Monmouth, OR — None

The presence of LED lights from oncoming traffic vehicles causes temporary blindness which is unsafe for drivers on the opposite lane. If nothing is done, there will be more frequent traffic accidents and potential deaths on the road.

A.183 November 30, 2024 — Brighton and Hove, United Kingdom — (no category given)

My life is pretty much destroyed by LED's.

If I look at a bright bulb for even a few seconds it triggers brutal migraines & vomiting for up to 3 days in bed with unbearable pain. The longer I'm exposed the worse it is.

Tried all the fl-41 glasses. Forget driving as all the newer cars have the 'led daylight running lamps' by default. It's an effing nightmare.

A.184 November 30, 2024 — Fontana, CA — Electromagnetic Sensitivity

The new LED headlights are so bright and blinding that I have to look at the fog line to watch the road and keep straight so I can't even see straight forward or the whole road, I have to constantly keep my eyes focused on the right side of the road not to have the light directly in my face/eyes. The LED lights are pointing towards the oncoming traffic and it seems like it's almost on purpose. The light off the cars are not even on both sides, they are tilted more towards the left and directly on to the oncoming traffic lanes. You can see the lines that come off the car on the road and it's obvious they don't have there lights facing straight. I get migraines from the bright glare at night it has just made driving at night tremendously uncomfortable and dangerous. At least regulate or enforce the direction of the light or something cause On the highway or freeway it's even worse as I have hundreds of cars with a bright blinding light facing my driving direction and it seems blinding other drivers to me should be illegal because it feels like it isn't and no one does anything about it.

A.185 November 30, 2024 — Orlando, FL — Migraine

I can no longer drive outside at night due to ongoing issues with bright headlights. This is especially problematic during the fall and winter as the sun sets much earlier.

December 2024

A.186 December 1, 2024 — Bowie, MD — Astigmatism

I have astigmatism. LEDs in cars have made it difficult for me to drive at night. I almost can never go anywhere during the week from how early it becomes dark. I have been fearful of accidents ever since a close call. It's just impossible to see for a time if they are coming towards me.

A.187 December 1, 2024 — Cranston, RI — Other

I am 39 with no known vision issues but I keep being blinded by LED headlights in front and behind me. It makes it really hard to see and drive safely at night. LEDs commonly used in new cars are way too bright. I had to pull in my left side mirror and this makes me scared to drive at night.

A.188 December 1, 2024 — Greenbrae, CA — Other

The County I live in took away the shrubs in the median and now all I see are in coming bright headlights. I get a headache when I drive at nighy and makes me feel stuck at home at night. I get an immediate headache and feel like I'm going to crash my car. They also installed rows and rows of LED overhead lights and they flood into my backyard and shine brightly into my bedroom and living room. Marin County did this and someone needs someone to do something about correcting this for the sake of our health. Thank you.

A.189 December 1, 2024 — Greenbrae, CA — Migraine

The County of Marin installed massive LED lights along a road directly behind our house. There was no community input, decisions made by Supervisors claiming they were needed for "safety". There has been zero incidents warranting any need for LED lights. Over head LED lights now shine into our home disturbing our sleep And giving us migraines at night. On the road, the lights are so bright it might as well be a racetrack now. The County took out the center median that had various shrubs (now no longer) - so now on coming cars, both east and west bound (along Sir Francis Drake Blvd) shine directly in our face as we drive home every night. The issue is overhead LED and car headlight LEDs. No thought was given by Marin County when installing said lights, and now created a real safety issue! Shame on Marin County, CA.

A.190 December 3, 2024 — Chattanooga, TN — None

I do not have any health or vision problems. I am a perfectly healthy mid 20 year old, and have always had a passion for night driving.

I never really noticed major issues with night driving up until recently… the past few years. I've always noticed people with super bright blue-white headlights… typically just squinted and moved on.

Unfortunately, the majority of the cars on the road have these headlights. I was returning from Thanksgiving with my family and had a 7 hour drive home. There are no north/south interstates in this area, so a lot of my driving is on 2 lane and 4 lane state roads and US highways. I was on a very narrow and typically low traffic 2 lane in southwest GA heading back north. For the first time I had to slow down to about 20 miles per hour because I was completely blinded. I could not see the center line. I could not see the edge of the road. For about 20 seconds all I could see what white light.

This is not an eye problem. I had my eyes examined a few months ago. This is not a specific to me issue either, as I have no ailments and am in good health. This happened to your normal young American driving home from the holidays, and hoping to get home safely without being flash banged off the road.

I know SUV's and trucks are the most popular vehicles now, but I have always driven coupes, and lots of people drive those and sedans as well. We are not the minority. Please look into regulating these headlights. These are not "improperly aligned" these are straight from the factory and they seem to get worse every year.

A.191 December 3, 2024 — North Olmstead, OH — Astigmatism

They are blinding and they cause me anxiety while driving. I have to stop or turn down side roads to escape them.

A.192 December 3, 2024 — Salem, OR — Migraine

I get ocular migraines, and the most reliable way to trigger them is to get blasted in the eyes with some kind of bright light. It usually sets in within 10-15 minutes, and then my vision is just ruined for the next hour. I can't drive at night because I'm at risk of being temporarily blinded. I don't want to have to pull over and sit at the side of the road for an hour, waiting for the aura to pass. When I'm in cars at night, I try not to look out the window. These blinding LED lights are a nightmare, and they don't even illuminate the road as thoroughly as the softer incandescent bulbs of my childhood. I've spent a lot of time in cars. I remember what things looked like. LED headlights are just plain inferior and dangerous, and they need to be banned.

A.193 December 4, 2024 — Houston, TX — Astigmatism

It worries me when I am temporarily blinded by the unnecessary bright lights when I am driving. I instantly flinch to try to shield me from the harmful lights.

A.194 December 4, 2024 — Monroe, WA — Migraine

LED lights have only negatively impacted my life. I can no longer see when driving, especially the last few years. I have to close my eyes when driving for long periods of time, multiple times, because I cannot see with people's LED lights. I can't tell if people are using their brights or just have LED lights. I can't see if there is a pedestrian. I can't see turns. I almost crashed tonight because I didn't see a turn due to someone's LED lights in my eyes. I see spots in my eyes for my entire drive after seeing any and trying to keep my eyes open. I get migraines. I might have undiagosed autism as well, either way, I am extremely sensitive to light. I am scared I might die driving because of LED lights one day.

A.195 December 4, 2024 — Morganville, NJ — None

WHEN DRIVING ON SINGLE-LANE ROADS IS ALMOST IMPOSSIBLE AS THE AUTO HEADLIGHTS ARE SO BRIGHT IT MAKES IT IMPOSSIBLE TO SEE THE ROAD. DIVIDED HIGHWAYS ARE NOT AS BAD. I USED TO ENJOY DRIVING BUT NOW IT IS IMPOSSIBLE UNFORTUNATELY, I STILL HAVE TO DRIVE. I TRIED SPECIAL GLASSES TO REDUCE GLARE BUT THEY DO NOT WORK. PLEASE DO SOMETHING ABOUT THIS BAD SITUATION AS I KNOW I'M NOT THE ONLY ONE HAVING THIS PROBLEM.

A.196 December 5, 2024 — Willows, CA — Astigmatism

Can't drive at night anymore. Bought special driving glasses to reduce glare and they help a little, but after a few minutes driving against the oncoming superbright led headlights, I'm not seeing anything very well. Driving at night was never an issue before someone decided that putting these dangerous lights on vehicles was somehow a good idea.

A.197 December 6, 2024 — Unspecified, FL — None

I was almost forced off the road due to the blinding lights of an upcoming car. I could NOT see a single thing. I was not alone in the car and was with my son. We thought my tires were lost on the right side due to the sudden movement. What a horrible experience, to drive under these conditions. There was no reason to change from the soft yellow lights.

A.198 December 7, 2024 — Murfreesboro, TN — Migraine

I get migraine headaches very easily. I avoid driving at night as much as I can because of these horrible, bright LED lights! They are absurd and horrible. However, sometimes I have to. I have issues with being super light sensitive and they flat out blind me, followed often with a migraine! I've grown to HATE driving at night and even more so, hatred for all of these vehicles with these lights. It's extremely RUDE to own one of these vehicles! Once again, as I drive a sedan, a truck tailed me, BLINDING me safely driving on the interstate home from seeing my family for Thanksgiving! How can these lights be legal? They're dangerous!! I refuse to own a vehicle with these horrific lights! Please stop this dangerous condition to not be able to drive safe!

A.199 December 8, 2024 — Colorado Springs, CO — Other

My sensitivity to LED became worse after a TBI. I wear sunglasses indoors because I work in a Flourescent and LED hell in the evening and I wear sunglasses to drive home. It is the only way for

me to stop myself from horrendous kaleidoscope vision as a person with synesthesia and tetrachromatic vision with post concussion photophobia. Light pollution is killing us and it is worse at night and contributing to severe migraines. Light pollution is literally making some people dopamine addicts but what about those with dopamine autoantibodies? We cannot have a strong nation of healthy people if we have been made stupid and intentionally addicted or severely ill by light. Street lights and lights used at night near businesses are at times bright enough to lead a bird to its death.

Have you seen the Tesla bulbs that are similar to incandescent-the reformulation? We need to bring back incandescent light bulbs.

I have tetrachromatic vision and this intense monochromatic light is causing me to have sensory overload. My tetrachromia causes me to see colors within colors- it is not a disability but a different ability. To me one strand of a persons hair is a rainbow. Ink from a pen is not just black. It only began to impact me after a TBI when my vision and senses began to go into overload and I was in a lot of pain and a neurologist, and nueroopthamologist could not understand me. Instead they began to take notes because I was finding out on my own what was working.

Some people who know this about me will shine LED lights in my eyes on purpose and laugh. These people are bullies.

As a tetrachromat I am even impacted by Migraine lenses called Avulux. These Migraine lenses make me very sick and cause me to have a migraine because they over focus the lense on one color of light spectrum when I am not designed that way. This is why I do not purchase monochromatic lenses either. Sunglasses with UV protection that are light enough color to use indoors work better than monochrome tinted lenses with UV protection. Incandescent bulbs do not have this, they are a variety of spectrum at once and do not have flicker most of the time.

These people that banned Incandescent lights are discriminating against my differences as a Neurodivergent, and my disability with a TBI and they need to bring them back. We need to have a choice of what kind of headlight we use on a vehicle, the intensity of the light in our home, and what kind of light works for us.

A person with synesthesia has more than one sense connected together. If I start to get this pain and this type of vision my sense of smell and hearing increase. This increase can cause hyper smelling and hyper hearing. If I have no protection from the light I will have burning eyes where the whites of my eyes turn red, my nose begins to run and my sinuses swell because the exposure causes hyperesthesia of my nose. Hours of exposure to Flourescents and LED do this to me. My immune system thinks it needs to release histamine. TILT is known as Toxicant Induced Loss of Tolerance. Its definition only applies to chemicals, food and drugs. For me the definition applies but I have another category to add and it is Light Pollution.

We as US citizens are being bombarded by exposures and as we age our tolerance declines and some are more at risk for this than others. These risk categories are yet to be established; however, it is likely that for women Xist and Lyonization are at play. This Lyonization could tilt a person with a Redox disorder towards less tolerance over time. Other mechanisms are molecular mimicry and prior assaults to the immune system. TILT is related to Mast Cell activity but is not the only aspect of the the problem.

For those of us experiencing this we have to wear hats and sunglasses. The eye doctors I have seen do not deny what I have been experiencing. The equipment that they use cannot find the problem. They have several patients similar to me wearing Theraspec lenses. These lenses are not approved by the FDA but have been helping the patients. I have called my Vision Insurance plan to discuss this phenomenon and why NeuroOpthamology, Opthamologists and other eye doctors are not diagnosing or investigating this. They do not answer my questions and change the subject. As humans who work in the evening, driving home in this light pollution is an absolute nightmare. The oncoming beams and beams behind you are reflecting in your face. More and more people are confessing to wearing sunglasses who are not as severe as me. Why is this being ignored? TBI can impact the retinal ganglion cells and excessively bright headlights and bright lighting in the workplace is very painful. I have to deal with disrespect, being made fun of because I am trying to protect myself.

Now it is December and I am getting more exposure from peoples Holiday light pollution on their homes that is way too damn bright at night and extremely painful. It is the nature of humans and businesses to lie to the public for gain while conditioning people to think that it is better for them through omissions of critical information.

A.200 December 8, 2024 — Harrison, OH — Other

I have noticed that these LED headlights are effecting my depth perception. When I look down the road at night to pull out of my street or any number of streets or changing lanes on the highway, and alI I see are bright lights, there is nothing to 'ground' my vision to judge how far away a vehicle is before I do these maneuvers, or even the size of the vehicle. I see nothing but bright lights. I had a truck coming at me when I pulled out of a driveway and I couldn't see anything but headlights. I couldn't see the road and I couldn't see the outline of the vehicle until it whizzed by. I had to GUESS where the road was and hope that I was on my side and I didn't run off the road. It was absolutely blinding and I drive an SUV! It was traumatizing to say the least. And that was two years ago! I could have been killed or seriously injured. Ever since then, with no standards as to what headlights are supposed to look like, how many headlights are allowed to be lit up at one time, style, etc. I'm scared when I get on the road at night and it's only out of necessity when I do go out, never for pleasure anymore. These lights have destroyed the ability to do the things I enjoyed after work. Shopping, water aerobics, dining out, etc. And then we're being advised to focus on the side of the road or the white line, if you can see it, so we can drive at night? We shouldn't look to see what's ahead of us or coming at us while we're driving because this is the only way to save our eyesight and life? We now have to drive dangerously to accommodate headlights. That kind of advice right there is a valid indication that these lights are wrong for vehicles. We shouldn't be looking down, or to the side while driving. That's like driving with your eyes half closed, which is really what one is doing following that advice. It only takes a second to hit a human being or an animal looking anywhere but in front of you. The ridiculousness of LED headlights is insane.

A.201 December 8, 2024 — Wakefield, MI — Other

Early onset, rapid decline cataracts, photosensitivity

A.202 December 8, 2024 — Wakefield, MI — Migraine

Vision assaulted by LED light bar mounted on front of a pickup truck. Temporary blindness, vision spots for hours, migraine. Ban these fu*ckers!

A.203 December 9, 2024 — Lake Forest, CA — Astigmatism

When I was driviing back from Las Vegas from Thanksgiving weekend I almost got into several car accidents because of being blinded by LEDs on curving two lane roads. It is impossible to see the lane markers when your night vision is destroyed by these new headlights. My girlfriend is almost completely unable to drive at night because of her astigmatism and how the headlight affect her vision.

A.204 December 9, 2024 — Portland, OR — Other

Almost got hit by another car (with LED lights) because their lights were so bright I couldn't see their turn signal blinking. I've come so close to hitting medians in the past too because LED lights are so blinding.

A.205 December 12, 2024 — Vermillion, OH — Migraine

in addition to migraine I have a condition called Mal de Debarquement syndrome. LED lights really trigger my symptoms. It’s very hard for me to go shopping or out to dinner and have a pleasurable experience. I always feel seasick.

A.206 December 13, 2024 — Boca Raton, FL — Other

Cant go out at night i suffer from seizures and i have head trauma makes is hard to go out at night with family there is no need for those lights we are not in the forest n some idiots drive with them on high beam blinds my wife at night n me she suffers from migraine this has effected our night life .i still don't understand how this passed with all health hazards

A.207 December 17, 2024 — King County, WA — None.

I became extremely nauseated and experienced a headache immediately upon entering Target and Safeway after they had just switched from fluorescent bulbs to led bulbs. I experience eye pain from led headlights and streetlights and have to shield my eyes wherever I go. I feel agitated around led lights at night.

A.208 December 18, 2024 — San Francisco, CA — Migraine

I have lived in the same building on Telegraph Hill for 30 years and the last series of led lights on the bay bridge increased my migraine headaches substantially. After they were removed my migraine decreased and my way of life improved.

A.209 December 18, 2024 — Springfield, MA — Other

Blinding headlights! It was very disorienting to drive. Eye doctor tested for cataracts by shining light in my eyes and then declared surgery for cataracts should help with the glare. What about windshield manufacturers helping, if FDA won't regulate the LEDs?

A.210 December 18, 2024 — Vallejo, CA — Other

My wife has conditions that include Hereditary Alpha Tryptasemia which is causing seizures. Bright lights can trigger them, too, so these LED lights are extremely harsh for her, meaning she cannot leave the house in the evenings anymore, or go into stores, doctor's offices, look at Christmas lights, etc., as they are all equipped with the new LED lights. We've resorted to not using the lights in our home as they are the new LED bulbs and we cannot purchase incandescent bulbs. Luckily we have two lamps with old bulbs that we can use. I do not have this issue, but when driving I notice how bright and blinding headlights appear to be these days. My first reaction is to think the drivers have their high beams on. The worst is large trucks with lights shining straight through the back window into the rear-view mirror. It's truly awful.

A.211 December 19, 2024 — Austin, TX — None

I am now too terrified to drive at night due to the blinding impact of LED lights, which cause me to not be able to see at all, have a panic attack, and swerve, endangering my life and the lives of others. They are much, much too bright. I had to drive from Texas to Louisiana at night last night for a funeral and I had to pull over four times because of the dizziness, fear and nausea of being struck by those lights which is almost like a heat lamp or a blow to the head. I cannot believe that something so dangerous as lights so bright they blind other drivers temporarily are allowed and unregulated. I can no longer drive at night in this environment.

A.212 December 19, 2024 — Canton, OH — None

I have almost driven off the side of the road and more time than not, I stopped in the middle of the road because all I saw what a bright light that blinded me and I could see nothing else. I cannot see anything after those lights pass me. if they are behind me, I have to make sure I am in the middle of my mirrors so it doesn't affect me. I have been wanting to go after the manufacturer for years now.

A.213 December 19, 2024 — Colorado Springs, CO — None

I was blinded by oncoming LED Headlights and turned the wrong way on a one way street. I have run intel two curbs due to to being blinded. They are DANGEROUS

A.214 December 19, 2024 — Heath, OH — Other

People with mild cataracts, like me, have problems with LED car headlights lights causing very bright sparkly halos around the headlights at night. This makes oncoming vehicles at night a big problem. The sparkly halos are blinding people and very unsafe. I avoid driving at night now. This has been a

well documented problem for several years. Note: I am a retired QA Manager from a large lighting company. I have a lot of experience with LED lighting.

A.215 December 20, 2024 — Drexel Hill, PA — Autism

I drive because it's difficult to participate in society if one doesn't, but my autism makes it very hard for me on multiple levels. For one, I am very sensitive to light, and overly bright headlights not only hurt my eyes but also obstruct the shapes of vehicles and the flow of traffic, making me afraid that I will collide with someone because I can't properly sense how their car takes up space. There is no valid reason for headlights to be that bright. Even those with weaker vision, such as my grandfather when he had cataracts, used to drive just fine with a softer beam. I have seen and heard others complain about these lights as well, such as my father and various social media users. Please don't make life harder for people with disabilities than it already is.

A.216 December 20, 2024 — New Orleans, LA — None

I cannot drive at night now because the superbright LED lights make me see halos about 20 feet high and wide around oncoming vehicles or vehicles behind me. I cannot see the road, the signs, the lines, pedestrians. It is sudden and violent to the eyes and the brain and nervous system. Now I am being advertised to by Amazon and Google to buy LED bulbs to replace the halogens in my own car headlights. I will not fight fire with fire and blind other people so I can compete with these atrocious tools.

A.217 December 21, 2024 — Olympia, WA — Other

Upon returning to my booth at an outdoor/covered Farmers Market, the Governor allowed "non-essentials" Crafters/Artisians could return. My soft lights didn't get moved to my new booth space. The first day my eyes ached (which I'd never experienced in 60 yrs). I recalled an by article Dr. Mercola who interviewed an Ophthalmologist who explained LED lights and eye damage. My instinct was to stand in the sun...no eye ache: BINGO! I knew it was the damn lights. I researched and purchased blue blockers and a wrap around my head visor because lighting came in from all directions.(And horribly had to wear a mask too = hell on earth!). I went to an micro-current intuitive healer who said it's your optic nerve especially in the left eye. I had had several treatments over the years and got better, thank Buddah, Allah, Godddess, Jesus and everyone! However I always carry blue blocker glasses in the car and a sun visor...because I never know how the lights in whatever store will affect me. It's been a huge challenge, life-style shift for me... even visiting friends homes I must be prepared. I'm much better. Although I went back to the OFMkt and had had my gear, went to the car to drop off stuff didn't think I'd need my visor, nor that I'd stay long. I sat on a table, waiting for a buddy and instantly my eyes started tweaking, and ached for hours afterwards. I've learned to try and not drive at night the headlights are horrific, especially first responders= blinding! I've learned to drive w/my left hand up to shield my eyes from the oncoming headlights. Years ago I titled all my mirrors waaaay out or up, I can lean to see when necessary. My question is whom decided LED's were the new way? Politically -- $omeone must be the king-pin-of-LEDlight$? I actually lucked out and purchased an entire box of 60watt bulbs at a used store, just as a volunteer walked in with a huge box of new bulbs for $10 (i know)! Before that I was purchasing used ones from Habitat for Humanity resale stores for $1 a bulb, and felt grateful for that!!! Thank you for your research, time and effort in this important area. I had no idea the ranges of challenges people continue to face. Big love to you and yours in this journey to educate. WE ARE NOT ALONE! Cheers.

A.218 December 21, 2024 — Port Colborne, ON — None

I crashed my car, totalled it because someone with LED headlights decided to enter and exit a roundabout with their high beams on. They were coming towards me and I was completely blinded by them for about 15 seconds before they passed me. I will take some fault as I was speeding a little but at that point it was too late and I crashed directly into another vehicle all because of LED light. They are too damn bright!!

A.219 December 22, 2024 — Sebastopol, CA — None

My eyesight is pretty good except for needing reading glasses for seeing things up close. But ever since the new super bright headlights have come out, I really don't want to drive at night. They are blinding and very dangerous, since I can't see anything else when they're coming at me. I adjust my

rear-view and side mirrors so that the lights don't shine in my eyes. That reduces my ability to see behind me, but it's safer than being blinded by those lights. I thought maybe it was just my eyes getting worse, but I notice that if a car is coming toward me with the old fashioned headlights, I can see totally fine. No problem. With the new headlights, I sometimes have to hold my hand up to block them so that I can see where the road is. Otherwise, I would be totally blinded. Very dangerous! I can't believe these are legal. They also hurt my eyes, and I'm sure they are damaging to vision.

A.220 December 22, 2024 — Vancouver, BC — Electromagnetic Sensitivity

Since so many vehicles are now using these bright, white LED car headlights it is practically impossible for me to drive. I have to hold my left hand up as they are so blinding, even in the daytime. Even sunglasses do not cut the bright light. I even drive at night with sunglasses on. This is very dangerous! When a car comes up from behind I have to hold my hand up by the side mirror as it also blinds me from the side and from the rear view mirror. It has become so dangerous for me to drive and has affected the quality of my life in so many ways. I don't know who gave these car companies permission to use these very bright LED white lights? It's like the whole city driving around with their high beams on or even worse! This must be rectified by the federal government! This must be stopped immediately!

A.221 December 23, 2024 — Portland, OR — Photophobia

Bright LED headlights on vehicles have become a significant challenge in my daily driving. On multiple occasions, cars equipped with excessively bright LED headlights have nearly caused accidents. When these lights shine directly into my eyes, especially from oncoming traffic, the glare is blinding and disorienting. Even vehicles behind me can create dangerous situations when their LED lights reflect intensely through my rearview or side mirrors.

To cope, I've had to resort to putting my hand up to block the glare while trying to maintain control of the car, which is both impractical and unsafe. This issue has led to numerous close calls where I almost veered off the road or into another vehicle. Additionally, the harsh intensity of these lights causes severe eye strain and headaches, making the driving experience not only stressful but physically painful.

These incidents have made me anxious about driving at night or in poor visibility conditions, as I'm constantly on edge, anticipating these blinding lights. It's clear that while LEDs have their benefits, their use in vehicle headlights needs better regulation to ensure road safety for everyone.

The Impact of Bright LED Lights on My Driving Experience

Bright LED headlights on modern vehicles have become a significant hazard while driving. On numerous occasions, these lights have nearly caused accidents, whether from oncoming cars or vehicles behind me. The glare from these excessively bright LEDs blinds me temporarily, often reflecting off my rearview or side mirrors, leaving me disoriented and forced to put my hand up to block the light. This is an impractical and unsafe solution while trying to maintain control of my car.

A particularly concerning issue is the auto brights feature in many modern cars. These systems frequently fail to detect other vehicles properly, leaving the brights on when they should dim. This not only creates an unsafe driving environment but is also a clear violation of traffic laws, as having your brights on within a certain distance of another vehicle is illegal. Such violations should be actively ticketed to deter this reckless behavior.

The cumulative impact of these bright lights has been severe for me. I've had multiple close calls, almost veering off the road or into other vehicles. Beyond the immediate danger, the glare causes eye strain, headaches, and general discomfort, making nighttime driving a source of anxiety and physical pain. While LED headlights offer benefits like increased visibility for drivers using them, they need stricter regulations and better technology to ensure they don't endanger others on the road.

A.222 December 24, 2024 — Anytown, NJ — Astigmatism

I have never hated driving so much as I have hated driving this year.

At night, thanks to the glare, I cannot see road signs without reflective coatings. When it rains at night, the combination of windshield fog, glare, and wet-pavement are brighter than the Lines-on-the-Fucking-Road. High-set SUVs with Bright As The Goddamn-Sun headlights shine directly into

my vision which, due to an astigmatism, breaks into a fireworks show in my eyes. Oncoming traffic actually hurts--like getting snipped with nail-scissors in the back of my head.

On one particularly vile strip of road I became paralyzed, unable to see my turning lane, and it was only by a Grace of God that I did not have an accident.

It used to be that this glare was only an occasional inconvenience--some thoughtless driver who forgot to turn off their high beams. Now between the strength of headlights and the height of cars, every minute spent driving at night is a damnation; miserable American roads befitting a miserable American people.

There's something poetic, something uniquely American, about the state of our roads at nights; they've become a dick-waving contest measured in lumens, fueled by selfish idiocy, gagging and slobbering for "MOAR BRIGHT" until nobody can fucking see.

Thank you for providing a space to voice these concerns. I eagerly look forward to seeing our regulatory institutions ignore this problem until it inconveniences someone important.

A.223 December 24, 2024 — Los Angeles, CA — Photophobia

Post mTBI: chronic migraine, severe neuralgia and dysautonomia all triggered by severe photalgia due to ipRGC retinal sensor injury - https://pmc.ncbi.nlm.nih.gov/articles/PMC7682828/

A.224 December 24, 2024 — Wichita, KS — Autism

Multiple brain injuries left me with diagnoses that include migraine, severe photophobia due to a retinal sensor injury - ipRGC's the Light Meter for the eyes which regulates circadian rhythm. It also manages retinal light adaptation. Exposure to LEDs and any blue spectrum bright light, especially light that flickers or moves, causes me intense pain, violent nausea, vomiting, weakness, chest pain, shortness of breath, a lot of the symptoms of a heart attack or a severe panic attack. It took me many doctor visits to learn the cause of this severe photophobia and flaring systemic symptoms . I also learned that I have a diagnosis of autism spectrum Level one which explains my severe sensory overwhelm experience to light, but that combined with this retinal injury has rendered me unable to drive at night at all in these new lighting conditions. It's so unsafe even wearing blue light blocking glasses with glare blocking appliqués in my windows to block headlights in my side views and the oncoming traffic.

A.225 December 26, 2024 — Seattle, WA — None

I'm 51 and have struggled with bright blue/white head lights for many, many years. Because most new cars come with them and many people are using LED bulbs in older headlight fixtures, the situation seems to be compounding exponentially.

I often get a headache from the eye strain and increasingly plan my life to avoid night time driving when possible. I have even begun using both a dark sun visor and yellow/amber tinted lenses to make night driving tolerable. This is not my preferred way to drive at night as it makes it more difficult to see dark objects or people dressed in dark clothing.

I find my need to do this ridiculous. I also don't know a single person of any age, that seems unbothered by the changes that have brought so much bothersome glare into our eyes as we drive.

Something needs to be done about this sooner than later and it is going to take a lot of work to change out or update all the headlights that are blinding me and everyone else I talk to.

Why are we allowing this unsafe way of illuminating our driving to continue? I want the department of transportation and/or the FDA and/or congress to begin addressing this problem NOW so that we can all drive more safely and with less eye strain and pain.

A.226 December 27, 2024 — Blanco, TX — None

There's a difference between brightness and color temperature. Brightness is measured in Lumans. Color temperature, in degrees Kelvin. It is not so much the brightness of these new headlights that causes so much irritating and dangerous glare as it is the very high color temperatures of 5,000, 6,000 or higher Kelvin. If the new vehicles simply used low Kelvin LEDs...2700 Kelvin or lower (a golden yellowish light), much of the annoyance would be alleviated.

A.227 December 28, 2024 — Taos, NM — None

Dusk and sun setting, combine that with LED headlights and it's impossible to see the road ahead. The LEDs are so bright that you cannot tell the make of the automobile.

A.228 December 30, 2024 — Anytown, MO — Astigmatism

I'm unable to see the lines on the road when someone uses LED lights. Almost everyone I come into contact fills the same way even if they do not have an astigmatism. LED lights are very dangerous for the most basic and single most important reason of all... TWO LANE ROADS!

Many people can drive just fine at night even with varying vision problems or none whatsoever with regular halogen or non-LED bulbs.

When someone uses brights they should see far and wide so they can look for deer and other animals etc.

However when a car is within 500 ft or less not even the brightest halogen should be used for low beams as this endangers not only the person who has the lights shining in their eyes, but it endangers the person shining the lights and someone else's eyes because it could create a head-on collision.

In fact, I'm willing to bet that many head-on collisions are result of LED lights on two-lane roads over someone looking at their phone.

If more intensive research was done you'd most likely find out I'm right since as a genius I'm right about 99% of the time about my speculations.

A.229 December 30, 2024 — Holly Springs, NC — Astigmatism

We live in a part of North Carolina that does not have street light coverage. In short it is VERY dark here. Driving at night here is quite a challenge. The blinding on coming headlights make it almost impossible to navigate the roads safely. Combine that with what appears to be distracted driving and you are taking your life in your hands just trying to get to the market. Something must be done to reduce the brightness of these dangerous headlights.

A.230 December 30, 2024 — Paterson, NJ — Other

The car lights are way too bright that blinds you

A.231 December 31, 2024 — Armada, MI — None

My wife just ordered a pair of night driving sunglasses which made me realize these modern LED headlights are just too bright, dangerous, and out of control. My wife (54), my son (20), and I (52) have been complaining about the bright headlights for the last couple of years. Another red flag is that my son also complains, and he's only 20 with perfect vision.

These dazzling lights diminish night vision and distort the field of depth. Both oncoming and rearview traffic dazzle. You can dim the center mirror, but side mirrors are not dimmable.

These headlights are dangerous to all people on the road and need to be regulated so they are either toned down or use a friendlier light frequency.

A.232 December 31, 2024 — Cherry Hill, NJ — Astigmatism

Bright LED Headlights have significantly impacted me, and my freedom to travel when and where I want to. I have an astigmatism, and have recently developed a driving phobia, which is largely connected to me getting overstimulated while driving. Nighttime used to be my preferred time to drive, as the roads were quieter. Now, with the LED lights, it's unbearable. Not only can I not see with the blinding lights in my face, but it greatly increases the chance I'll need to pull over and calm myself. I struggle greatly getting to all the places I used to go, and the bright headlights make the process even worse.

I genuinely feel like it is not a problem that will solve itself. In order for others to feel safe competing with the other blinding headlights (I often feel like I cannot see after passing a car with these and often in the moment wish my lights were brighter) they too need to get these LEDs. Manufacturers won't care, if anything they can advertise being the brightest.

We desperately need some sort of deterrent, because I fear for my life when I get blinded on the road at night, and wonder how many life-altering accidents have been caused by this issue. Or even what the long-term effects of these are. I wish to be free to travel where I want without this unnecessary harm.

A.233 December 31, 2024 — Orléans, France — None

It's New Year's Eve, and for the fifth consecutive year, I'm staying home and not participating in any festivities because of the blinding LED lights that are now everywhere and assault my eyes.

When the first street lights and vehicle LED headlights appeared in my area five years ago, I realized that my daily life would be completely turned upside down. I feel like I've been condemned to no longer live normally, like I used to, especially in the evenings. I can't live freely in society anymore, with a clear conscience, without the fear of having my eyes constantly assaulted by these completely excessive lights.

I'm tired of all this. Tired of having to endure these car headlights with insane brightness levels, at night JUST LIKE DURING THE DAY, forcing me to look away and leaving trails in my vision. Tired of noticing that many designs and installations of lighting fixtures are systematically done thoughtlessly, over-illuminating the entire neighborhood. Tired of these street lights that repel me and prevent me from being out at night.

The world has plunged into a light arms race that I don't understand and can no longer tolerate! Why have we come to this? Who decided this on behalf of everyone else?

Science had warned about LEDs, but it wasn't listened to. Many people complain, but they're not heard.

What's happening? What's the plan? How much longer do we have to protest and shout for the LED monster, created by a greedy and careless industry, to stop spreading uncontrollably? I deeply curse everyone who created this monster, and every day I wonder how much longer I can endure this situation before I decide to move far away so I no longer have to suffer from it.

In any case, we need to unite to make the global LED industry bend so that acceptable lighting standards for everyone are established and enforced.

Happy New Year to everyone and stay strong.

Reports received in 2025

January 2025

A.234 January 1, 2025 — Cypress, TX — Migraine

It breaks my heart that this is the case today. I remember seeing maybe 1 in every 25 cars with LED headlights, now it's 1 in every 25 that have regular, soft white/yellow lights. I literally cannot drive with these vehicles on the road. Migraine disorder means extreme light sensitivity for most of us who suffer from migraines, not only when migraines are happening, but always. I usually end up with an uphill battle of pain after getting home from driving. My friend has said to me, "Well, how about you don't look at them?" And this is where some people may not understand; people with epilepsy, migraine disorder, and light sensitivity will feel actual, visceral pain in our retinas, even when the light is in our peripheral. On top of that, our eyes are perceiving them brighter than other people. The cars are driving towards our direction, and the light will engulf our vision. I cannot stress it enough: We cannot see. We cannot see, and it hurts, a lot.

A.235 January 4, 2025 — Shippenville, PA — Migraine

My wife recently experienced a debilitating migraine triggered by using a computer with an LED screen. Not only was it the screen that caused this but the LED backlit keyboard. Within moments of exposure, she felt an intense, throbbing pain above her right eye, accompanied by a piercing headache that grew progressively worse. The migraine not only impaired her vision but also left her feeling nauseous and hypersensitive to light and sound, making it impossible for her to continue with her activities. The overwhelming pain and discomfort forced her to retreat to a dark, quiet room for

relief, underscoring just how debilitating the effects of LED screens can be for someone with her sensitivities. It got to the point where she vomited later in the day from the intense pain and nausea.

A.236 January 6, 2025 — Manchester, NH — Migraine

Driving at night has become basically impossible. The worst culprits I have noticed are Jeeps and newer Honda SUVs. I come home with a headache every single night. I am tempted to tell my work I can no longer work nights because driving home is nothing short of painful and dangerous. As cars with newer LEDs pass, I can not see anything and I am forced to look away from the road. This is hazardous for obvious reasons. I'm hoping this website can make a change.

A.237 January 7, 2025 — Philadelphia, PA — Other

Started watching a lot of internet on smartphone in 2020 6 months later left eye got worse than right eye. Can still use right eye. Go in soon hope they can repair it .Eyes bleary after screen use.

A.238 January 9, 2025 — Anytown, TX — Astigmatism

Car headlights blinded me for a minute, I had to park until the dark spot in my central vision was gone. I am thankful I was not traveling on a highway or a street without a safety lane

A.239 January 10, 2025 — Livonia, MI — Other

November 6 of last year I'm taking my grandson to preschool. It's 7:30 in the morning and raining. I'm in the left-hand turn lane and the truck in the opposing left-hand turn lane facing me headlights were so bright that I could not see the oncoming traffic in order for me to complete my turn. I was temporarily blinded all I seen was white spots after the truck had made his turn and I had to sit through to the next light. Everybody knows you can't complete left-hand turn until the light is almost red anymore and even then people are still coming through. and this was the case that morning. I was frozen like a deer in the headlights, I could not turn. people behind me were blowing their horns motioning me to go go go. I didn't want to risk my life or my grandson's life. So I sat all the way through to the next light after the other truck had turned then I could see beyond to the oncoming traffic.

A.240 January 11, 2025 — San Diego, CA — Other

Led car lights are a daily problem for me. The blaring lights are debilitatingly blinding while driving. It's scary and unsafe. It's forcing me off the road at a young age. Force a recall on these lights.

A.241 January 12, 2025 — Ames, IA — Migraine

Single incident? No, EVERY TIME I drive from when they first came out. I did not know what a migraine was until then. It would have been fine had I never experienced it/them. I am a lighting consultant among other things. Some lighting is designed - you see the illumination of a target as opposed to the source and is has to do with humans/living things in a pleasing and functional way without stress on the user/beneficiary. Even the blue spectrum/high k temp lights are somewhat bearable if designed and aimed well but I still wear brown lens, wrap around sunglasses all the time I drive for incidental exposure. Not ideal but they protect my health. Then there are the engineered super bright lights that just puke out as many lumens as possible in every direction. They are as bright or brighter than the sun and headed straight towards me often during the day and night. They bother me from miles away. The new LED driving lights are brighter than my high beams!!! I use my sun visor to block out these bright as the sun headlights along with most of the vehicle. They have then on in the name of safety causing me to protect myself by doing less safe things. I can see the bottoms of the cars in front of me when the offensive lights are approaching - that's all - it does not keep me aware of the bigger traffic picture. In other words they are a hazard to safe driving on the order of texting while driving - a huge distraction. Why do someone(s) have to die before these obviously poorly designed products are taken off the market? I'm sure to has happened countless times already but not been attributed to that. I am tempted to make a scene on the order of a federal case by smashing the most offensive ones (pick up trucks) in public to get national attention for this it is so bad. Nothing short of that will get things changed it would seem.

A.242 January 12, 2025 — Brunswick, OH — Astigmatism

My eyes cannot adjust to the extreme brightness of LED headlights. I have astigmatisms which already makes nighttime driving difficult. Almost causing accidents due to the lights and stopping on the road is also dangerous but it's because the lights coming towards me and behind me are so bright my entire car is lit up. How is any of this safe? We all know safety isn't your concern and couldn't care less about potential and accidents that have already occurred from this.

A.243 January 12, 2025 — Glenside, PA — Photophobia

I had a recent situation in the movie theater while watching “Wicked” that sent me into a blackout paranoid state; after leaving the theater, the oncoming auto lights/traffic lights/police lights just exacerbated the situation. I have no memory of the evening. I went to the emergency room in the morning and blood/urine tests showed no drugs or alcohol. I do not have epilepsy and have no medical conditions. I have been using candlelight and red lights at night in my home since 2020 and rarely drive (2018 car with only 17,000 miles). I had a similar event about two years ago after watching a TV series that used flashing strobe lights. I have a PhD and have been looking for research and case studies on the topic of the health consequences of light/flashing lights at night. My goal is to 1) figure out what happened to me, and 2) help others who would just attribute this to being "crazy." Thank you!

A.244 January 12, 2025 — Twentynine Palms, CA — Other

Cannot drive at night anymore due to the extremely brights white lights on cars. They hurt my eyes and cause neurological problems. They are extremely dangerous.

A.245 January 13, 2025 — Halifax, NS, Canada — None

As a car enthusiast who use to love going to shows, events, and night driving, LED headlights have now ruined this hobby and causes me anxiety to drive at night. Last Friday (1/13/2025) I had to drive at night. The trucks/jeeps/SUVs with LED headlights 6 feet off the ground make the road so unsafe i cannot use my mirrors when they are behind me and cannot see when they are in front of me. While a truck was behind me it made it so difficult to see that I almost hit a pedestrian on the road who was crossing (illegally but still). This is not safe! I don't hate LED lights, I just feel if the headlight is above the average eye level of a car (car is above the cutoff shield) then LED headlights should not be allowed. We are also seeing this in large 18-wheeler trucks now, some having 6 LED headlights (4 lights + fog lights). Please stop this nonsense, it's a marketing scam and the transportation safety board is doing nothing to stop it. We could all see fine 10 years ago with non-LED headlights.

A.246 January 13, 2025 — Scappoose, OR — Other

Full fledged anxiety because being blinded puts me into fight or flight adrenaline mode, because if I am not vigilant I could crash. LED lights are so bright, I cannot see in front of me, beside, or behind me. I am not at fault for being blinded, they are at fault for blinding me.

A.247 January 19, 2025 — Norman, OK — Astigmatism

It’s become impossible to drive at night anymore. I have astigmatism in both eyes and LED headlights have become so bright that it gives me terrible headaches.

A.248 January 24, 2025 — Stockholm, Sweden — Other

I hate driving car at night. I have a short kia so the light of these led SUV and not even subs always just goes right into my car making me unable to see what's Infront of me nor what's inside my car so I could not even turn on the warning blinkers to signal for them to pass...

A.249 January 31, 2025 — Middlesex, NJ — Astigmatism

Hello, I just found out about this and I wanted to share that I used to love driving at night when I first got my license! I’m a bit of an anxious driver so driving when there were less people on the road gave me some peace of mind. It’s been almost a decade now and car headlights have only gotten brighter and brighter, especially Tesla. There is absolutely no reason for these cars to have headlights this bright as the world didn’t get darker nor did we lose streetlights. Now I am no longer able to drive at night. I have an astigmatism in my left eye, mild in my right eye and I do have glasses with anti glare on them which I paid a good chunk of money for, it hardly helps. I bought the yellow glasses, they

hardly help either. These lights are blinding and I feel like as a result, people who already can't see drive around with their high beams on to counteract that. I used to love driving at night, now I dread it, especially if it's raining. A few years ago when Teslas started ramping up in popularity, I was driving down a road at night in my old car which was a 2015 Kia Forte EX. I was so badly blinded by this Tesla coming from the opposite direction, I couldn't see and the next thing I knew, I heard a smash from the right side of my car. I had lost my right side mirror to a full garbage can on the side of the road due to my inability to see properly and had to replace it. I'm grateful that's all that happened. Now whenever cars with those bright headlights come at me, I have to slow down significantly to avoid a repeat of that. Nothing I do helps, it's not like I'm blind. I just have an astigmatism in one eye. It never bothered me a decade ago and it was always this bad growing up. It saddens me nothing is done about these cars and how it's so clearly a threat to the public's safety, but we as a country set our sights on other, less important matters. These need to be regulated, how many accidents happen or go unreported due to these headlights? How many other people avoid driving at night because of this? How many other people crashed into something, lost their mirror, what have you? Thank you for your time.

February 2025

A.250 February 2, 2025 — Los Angeles, CA — Astigmatism

Driving in the evening or at night has now become an impossible, highly stress-inducing task. I have almost been in an accident so many times due to having to look away from the road to avoid being blinded. This is insanity and I cannot imagine having to deal with this for the rest of my life. I have never felt more unsafe driving on the road and it seems insane to me that there has been no regulation on these blinding lights. I am begging someone to help put an end to this nightmare.

A.251 February 2, 2025 — Ovilla, TX — Other

Momentary blindness that occurs repeatedly during nighttime commute to work.

A.252 February 4, 2025 — Vancouver, Canada — Electromagnetic Sensitivity

Since they have started using LED car headlights and also LED street lights I am unable to drive in the evening and at night as well as find it very difficult to even drive during the day. The lights are blinding from head on and also from behind in the rear view mirrors and side mirrors. This has affected my life and freedom immensely. It is even difficult to go for a walk through the streets because when these car lights come at you they are blinding.

These lights are ruining the ambience of the city as well.

Another problem is that the moth population is not breeding due to these very bright LED lights. This is going to have a terrible effect on the ecosystem. These need to be stopped from being used immediately! There are many other negative health effects of LED lights which I will submit later.

A.253 February 4, 2025 — Weaverville, NC — Other

Driving at night has gradually become more dangerous due to the increasing presence of blinding LED headlights. One has to either: look away or physically block the insanely bright blue light, lest they be blinded. The risk is so blatant, I do not understand how ultra high beams are not only legal, but becoming the norm.

A.254 February 6, 2025 — Atlanta, GA — Other

The new LED headlights are blinding! They hurt my eyes and distract me. Instead of helping they are detrimental to everyone else on the road. Especially in urban areas there's no reason for regular lights to look like "brights"

A.255 February 6, 2025 — Gray, GA — Migraine

my husband works as a domino's delivery driver and frequently drives at night. he usually ends up getting migraines from these incredibly bright LED lights. he has told me he cannot see and it is difficult to drive and has to take aspirin often to just get relief from the migraines they cause. not only do the headlights that drive past him bother him, the headlights from people from behind also prevent him from seeing the road clearly. it is especially dangerous since we live in the country and

there very well could be a deer and he would not be able to see it. its even worse when it is raining. these lights should be illegal for how dangerous they are to drivers.

A.256 February 6, 2025 — Mabank, TX — Migraine

I have documented light sensitivity. Before, halogens easily triggered headaches and migraines and I have installed 2000K bulbs in my house, placed "night mode" programs on computers and on phones before they became standard, and seen multiple doctors on how to best deal with it. My eyes cannot handle cool white lighting and can barely tolerate warm white lighting. Any form of blue-tone lighting will trigger headaches and migraines that make my vision blur and my head pound. With the introduction of bright cool white LEDs in headlights and streetlights, my ability to drive at night has gotten much worse. I am forced to wear tinted sunglasses while driving, which reduces my visibility, because the other option is being unable to drive. While I understand LEDs are more energy-efficient and effective at light distribution, the fact the color is a cool and very bright white has reduced my quality of life severely. I used to love driving at night, as it was much easier on my eyes than driving in the daytime, where my eyes have a very hard time handling sunny days. However, now there is no time of day where I can enjoy driving without any impairments. LEDs are not the problem, I can handle LEDs of other softer colors, but the white of 5000-4000K has made life much worse.

A.257 February 6, 2025 — Richmond, RI — None

I get temporarily blinded when oncoming vehicles have their bright LED lights on, it's hard to drive when being blinded from both in front and behind with the glare of bright led headlights reflecting off both my left side mirror and rear-view mirror.

A.258 February 11, 2025 — Manassas, VA — None

Driving in the rain at night with everyone's headlights behind me it is nearly impossible to see the road in front of me. Thankfully there were trees blocking the oncoming traffic's lights, otherwise I seriously don't think I would've made it home. It's incredibly dangerous and I could've gotten into a very serious accident, I had to slow down and even pull over at a certain point to let people pass me so that I could see the road again. Regulate the brightness of these new headlights!

A.259 February 13, 2025 — Battle Creek, MI — Migraine

I bought a box of led lights because that was all that was available at the store. I put them in my bathroom fixture and every time I turn the light on they flicker so much I have to turn the light off. The same in my kitchen. The flickering causes me to get Ocular migraines on a regular basis. This causes nausea and balance problems and I can't drive. I have quit driving at night because of the led headlights afraid I will get a migraine and not be able to get home. I suppose they save energy if you are afraid to turn your lights on at night.

A.260 February 15, 2025 — Baltimore, MD — None

I almost hit a car while trying to shield my eyes from an oncoming car with bright lights. I have driven all over the world, I see we are way behind with light sensitivity, we have been for decades - look up how Brazil has managed this for decades. Please help stop this unsafe and unnecessary bright light issue.

A.261 February 16, 2025 — Amelia, OH — None

Was driving on a narrow two lane road. A car with the LED headlights was coming towards me. It was snowing out. The road was covered on both sides of the road. I slowed down to 15mph. As he passed his mirror hit my mirror. Causing damage to his mirror. He had a dash cam and it showed me on the yellow line. Had he NOT had the LED lights. I believe it never would've happened. I also got a $125 ticket for driving left if center. Im 35yrs old and ive never been an a "at fault accident" nor a ticket! I 100% blame the LED lights!!

A.262 February 16, 2025 — Woodbridge, NJ — None

I am a school bus driver in Central NJ. I am also a "car guy" for life! I've been working on, fixing and racing/driving since I was a teen. I own a 1995 VW Jetta 5speed that is 98% restored/tuned. Drove it 253,000 miles on the original clutch and shot a Mobil1 commercial with it in 2015. Google: David Alston + Mobil1.

I do not have any vision impairments or health issues. I also have incredible vision in the dark. A lot of these newer cars are annoying as hell with these "ridiculously" bright L.E.D. headlights. Hondas. Ford F150s. Kia. Tesla. Why are these vehicles "allowed" to be put on the road with these "stupid-bright" lights?!! And if you need lights "that bright" to see at night, you SHOULDN'T be driving!!!! This is EXTREMELY URGENT and SOMEONE NEEDS TO ADDRESS IT RIGHT FUCKING NOW! I am a "former" Fed. I worked in IT 16 years in DC. NHTSA needs to get off their ass and fast! Sick of these stupid L.E.D.s!!!! Google: David Alston + C.I.A. - NJ.com.

A.263 February 17, 2025 — Anytown, MI — Autism

I have astigmatisms, photosensitivity, and am currently in the process of being evaluated for autism. These LED headlights are violently bright and trigger physical pain starting behind my eyes that shoots through to the back of my head and causes emotional distress, to the point of once pulling over (nearly crashing in the process) and engaging in self injurious behaviors due to dysregulation. They have nearly caused accidents to myself and others on numerous occasions. This is an issue far from limited to those with disabilities; anybody I ride with will feverishly complain whenever being faced with or followed by an LED headlight bearing vehicle. Pedestrian deaths have only increased since the switch, brightness is utterly unproductive if it blinds every other driver on the road. We need regulation on the harshness and we need it now.

A.264 February 17, 2025 — Yolo County, CA — Autism

I was driving east on Hwy 16 towards Woodland, when I noticed intense amber LED flashing lights close to a mile ahead. I started to slow down. As I reached the LED flashing lights, the intensity and digital pulsing was unbearable. There were multiple vehicles. The panic started to set in. I covered my eyes with my hands and slowed to less than 20mph, basically trapped by the LED lights. I crept forward in my car, blocking nearly everything from my sight except for a narrow sliver of road near the center line that I could see. Major panic started to set in as I passed the vehicles, which turned out to be about 3 Yolo County Sheriff's vehicles. After I passed, I glanced back in my rear view mirror and was struck by red and blue LED flashing lights. I let out a scream of agony. I suffered significant emotional trauma from this event.

A.265 February 19, 2025 — Hammond, IN — Astigmatism

I used to love to drive. I've driven hundreds of thousands of miles all over this country. LED headlights are without an ounce of hyperbole: painful. Even LED billboards cause discomfort. I have to take my eyes off the road when there's oncoming traffic with misaligned LED head lights. They need to be banned.

A.266 February 24, 2025 — New Prague, MN — Astigmatism

I am 19 years old and generally have decent eyesight, aside from my astigmatism. I have noticed consistently that after driving at night there will be spots in my vision on my left eye, and my vision is noticeably worse on that side. I drive a small car, but that shouldn't mean I deserve to be blind. The main issue is large trucks and SUVs that put on lift kits and aftermarket headlights that aren't using the same light geometry as the OEM. There are sedans with bright lights but it's far less common.

A.267 February 28, 2025 — Salem, OR — None

I am regularly blinded by oncoming traffic while driving at night, and can only hope that no pedestrians, animals, or other motorists are in my path while the oncoming traffic passes. The problem is not only the brightness or quality of the light, but also the angle. The height of modern trucks and SUVs puts the beams directly into the eyes of people driving normal height sedans, coupes and hatchbacks.

March 2025

A.268 March 2, 2025 — Detroit, MI — None

I just took my first road trip of roughly 360~ miles and part of it was during the night time, I had to drive on a highway with no lights so the only sources of light I had were other vehicles. Every so often, I would have to deal with the blinding LEDs of a typically newer model vehicle either driving up on me from behind and blinding me in the mirrors, or an oncoming one across the highway that I could

spot from miles and miles away as if they were the sun. As an automobile enthusiast, it really bummed me out to have to get a harsh slap of reality that driving at night isn't as fun as my parents told me it was when they were younger due to the constant visibility issues caused by these LEDs, and I challenge every vehicle manufacturer and the NHTSA to work together to lower the legal lumen output on vehicles so we can all experience safer road trips and nightly commutes.

A.269 March 5, 2025 — Arlington, TX — Astigmatism

A truck with LED headlamps and also aftermarket LED off road lamps was behind me. They were so bright that I could not see anything else around me, except for the truck. This sort of thing happens all the time. Sometimes the only relief I can get is if I put on sunglasses driving on the freeway to cut the extra bright blue light down. LED lights will cause me momentary blindness, and eye pain at times. It is extremely annoying and very dangerous!!

A.270 March 5, 2025 — King of Prussia, PA — Photophobia

HOA upgraded all outdoor lights in lamp posts to 5000K, 3000 Lumen bulbs that shine in all directions, including into my end unit. My once-beautiful panoramic view is now dominated by an arsenal of glaring "headlights." The lights also have faulty sensors so that they turn on 90 minutes before sunset and also turn on when their are cloudy/rainy conditions. It has major effects on my mental health and my vision that I am trying to preserve by avoiding super-bright light.

A.271 March 7, 2025 — Anytown, FL — Photophobia

On the bottom of your HOME page, under the Sign Petition is a paragraph that is, in a sense, incorrect. The very last sentence stats that there is little to no government regulation (on the LEDs) and that is NOT correct. The fact is that was phenomenal government regulation, and it was all FOR LEDs. They banned incandescent bulbs and forced people to buy LEDs. President Trump changed that in his first term in office, and I do not know what has happened since then, but I do know that even if incandescents are now being sold, they have basically changed over the lighting industry to the LEDs and it is extremely difficult to even find Incandescent, especially in the higher voltages (200w, etc). It would be educational if you added to that paragraph the involvement of the government in this blinding debacle! Thanks for your work! PS: I am a redhead and I love strong lights (redheads are the only "species" that make D3 thru their eyes and they seem to have an strong affinity for light), but these LEDs are going to cause blindness. We have a family member who has severe photosensitivity, and they are tortured by the LEDs ! PLUS, the frequencies of LEDs are harmful to the human biome.

A.272 March 8, 2025 — Easley, SC — Photophobia

Blinding and destruction of clear vision during and after on coming traffic.

A.273 March 8, 2025 — Troy, OH — Migraine

My life has changed completely because of LED! I have suffered 49 years with migraines, and recently, LED lights are a contributing factor in me qualifying for disability benefits. LEDs trigger migraines, and are everywhere - stores, computers, cars, doctor offices - everywhere I go I am walking into a landmine. We built a house, and I stocked up in enough incandescent bulbs to last me the rest of my life. Even buying a new car has become difficult, because of all the blue interior LED lights. ENOUGH already!

A.274 March 9, 2025 — Phoenix, AZ — None

Momentary blindness is caused when hit with bright LED lights. Which in effect can cause a car accident either with another vehicle or pedestrian.

A.275 March 15, 2025 — Seattle, WA — Photophobia

I suffer from a neurological condition triggered by the COVID-19 virus, which has resulted in heightened sensitivity to various forms of sensory input, a challenge faced by tens of thousands experiencing long COVID in our country. Initially, this condition was somewhat manageable; however, the increasing prevalence of excessively bright LED headlights has rendered me completely unable to leave my home. Encountering these headlights is catastrophic for me.

It induces significant eye strain, excrutiating pain behind my eyes, extreme tension in my chest and shoulders, heart palpitations, and severe tension headaches; followed by a state of utter panic in my nervous system that persists for days, sometimes weeks, interrupting sleep and severely hindering my quality of life.

My partner, who is neurotypical, has reported that these lights are blinding when oncoming at night, leading to near-collision incidents for both of us on multiple occasions. I have yet to meet a single person who has not raised concerns about the safety risks posed by these headlights within our communities. By their very design, headlights are intended to enhance nighttime visibility, not hinder it. Therefore, I strongly advocate for their prohibition, as this matter has become urgent. The consequences of this issue extend far beyond individuals with medical conditions; it adversely affects the entire population. Countless individuals are forced to abandon driving and travelling after dark, which diminishes the working population and compromises the economies overall functionality.

It creates hazardous conditions for all road users, increasing the risk of physical harm and even fatalities. I urge you to take action on this pressing matter to safeguard the well-being of citizens who urgently seek protection from the dangers associated with this new "technology."

A.276 March 19, 2025 — San Diego, CA — Migraine

Last night a truck with LED lights triggered another painful, nauseating migraine. I used to love driving at night and going out late. Now every time I go out at night, I have a strong chance of triggering a debilitating migraine due to the blinding LED lights that flash and move with their vehicles. When cars hit bumps or dips, it makes their lights bounce which makes the effect so much worse. Please do something about this, at the very least, put a coating on the lights to dim their brightness

A.277 March 20, 2025 — Kuna, ID — Migraine

God save us 8-5 workers driving sedans in the winter. Never a workday I don't have to drive in the dark for my 1hr commute. I used to do delivery service a lot in recent years and it gets worse and worse every year with how blinding headlights are. Not a fan of showing up to work--a deskjob where I'm already staring at a screen all day--and feeling like I just had a fresh lobotomy. Can't even tell you how many times I've driven over road lines because I just can't see them while getting flashbanged then having a lingering sunspot center in my vision. It's ritual for me to keep my rearview mirror turned up and point my side-mirrors down just to drive safely... I hope one day Europeans won't have a good reason to keep laughing at how technologically behind our country is. >_>

A.278 March 20, 2025 — Manassas, VA — Astigmatism

I mainly drive on roads with many hills, bumps, curves, etc... You're going to get beamed no matter how "properly aimed" the headlights are. However, while I can quickly recover from halogens (high beams even) and still see what's ahead, LEDs leave me blinded for multiple seconds at a time and even cause headaches. Looking away does not work and even if it did, you're still driving blindly with no idea if there are obstructions, animals, or pedestrians ahead.

This is further worsened by the fact that Auto High Beams do not work. They do not respond quick enough and oftentimes flash high beams while there is still oncoming traffic.

Driving on highways, the guardrails also cause intense light to flash rapidly which is a huge health and safety hazard.

A.279 March 24, 2025 — Manheim, PA — Migraine

The headlights lately have become increasingly bright. I am a 45 year migraine sufferer and over the last couple years anytime I drive headlights are terribly bright and trigger a migraine aknots immediately or within 12 hours. It's really hard to drive when it's dark and sometimes even during the day because the extremely bright headlights. I Shoukd not be able to see with the headlights behind me lighting the way or blinding me coming towards me . I either have to wear sunglasses or cover my eyes (kinda a problem when driving) there was a newer dodge ram with headlights so bright that driving was almost impossible (oncoming traffic). I'm not sure who is regulating this but they surely must not be ever driving. I was told by the local government offices that they are after market

lights. That many people do not put after market lights in their cars. There are so many incidents of bright lights

A.280 March 24, 2025 — Springfield, OR — Electromagnetic Sensitivity

LEDs are disruptive and they are found everywhere, from your very own personal factory car to the street lamps on every street you journey. I for one am tired of the blue lights that I have been told are "broken" in my own township of Springfield, OR.

No one seems to care that something that is considered "broken" has gone unfixed. I have shared my concerns with the local officials, anywhere from the Mayor's chat on Instagram to directly contacting our local electric company, SUB, who is in charge of them. The message is "we're working on it", "be patient with us", "this was approved", "it's gonna be fine", "we'll fix things when we can". And here we are two years later and the "broken" blue lights have remained.

These lights on cars cause me night blindness, force my husband and myself to switch between brights and dims as a way of expressing to other drivers on the road that were are considerate of other drivers--it's just our dims look like brights because our car is so tall (and this affects others even in the same kind of car as us). These blinding lights can cause accidents and are very dangerous for this reason.

I know that blue light affects people because it affects me. My mood shifts to somber and dull. I feel ill and just want to get away from the area as fast as possible.

These lights must be removed and we want our soft yellow incandescent bulbs back that do not cause the light pollution that these bulbs have caused our civilization to suffer. Remove all the LEDs and even outlaw their production, as they cause more harm than good to every person who comes into contact with them.

A.281 March 26, 2025 — Donalsonville, GA — Astigmatism

My neighbor keeps her led amber patio lights on 24/7. Even after she knows they bother me, knows they keep me from seeing the sky for sky watching, the lights spill into my yard and into my kitchen. I've had to put up curtains and shades to block the lights. She told me at first she was forgetting to turn them off. I told her they are "not bothering me", but is she were to remember that'd be fine. She never remembered. And the light just seemed to get worse as time went on. Which is now about 6 months. Now she knows they are a nuisance to me, but she has ignored my letter to abate. She took the letter and threw it back into my yard, like a child would do. She is fully aware that her lights are a nuisance but has become increasingly hostile. When I mentioned earlier incidents she said, "doesn't know what I am talking about" like a Narcissist. I think she enjoys bothering me. But I am about to call the code enforcer and considering small claims court. I have taken pictures of the outside and inside my kitchen to show the extent of the light pollution. I've mentioned my eye health to her on several occasions. She's been in my house and has seen the curtains and shades. She is obtuse to the fact that I don't like confrontation and will you please take a hint. But she never does. When I did finally confront her she was in denial and hostile. I am 66 years old with astigmatism and cataracts. I like the dark rural area I live in. My eyes are very sensitive to light. Thank you for letting me vent. Today I talk to the code enforcer.

A.282 March 26, 2025 — Greensboro, NC — Photophobia

Certain bright LED lights, particularly house flood/security lights and car headlights, give me an instant headache behind my eyes. These headaches last anywhere from 30 minutes to 2 weeks. These headaches are not "psychological "; I've been evaluated by several doctors and my condition is 100% real. I'm not quite sure what's causing my photophobia, it might be migraines and dry eyes. The common belief that "led lights are flawless and superior" is completely false. These lights emit way too much blue light and have a bad flicker. Incandescent lights are more expensive because, like expensive healthy food, they are good for us.

A.283 March 29, 2025 — Melbourne, Australia — Other

Unfortunately, I will not be going to the Australian Ballet or Opera Australia performances any more due to the after effects of the LED (not strobe) lighting from the stage which shone into the audience. I am neither epileptic nor autistic but suffered vertigo and vomiting after one performance and

nausea and headaches after their next performance even though I covered my eyes when any LED lights shone from the stage. Apparently, vertigo and vomiting can be induced by LED torches called “Sick Sticks” or “Vomit guns” that are used for crowd control in some jurisdictions. Does this happen to other people? It is disappointing that this is going to have a negative impact on my life if I am unable to attend other forms of live performances.

A.284 March 30, 2025 — Mauldin, SC — None

I no longer find it safe to drive at night due to the blinding LED headlights of oncoming traffic. I refuse to drive on roads that I am unfamiliar with at night. I hate that it limits me traveling even short distances at night. I am 43 years old, no vision problems as of yet. However, these damn bright headlights sure make me feel like I have major vision problems on the road after dark. Something's gotta give!

A.285 March 30, 2025 — New York, NY — None

I had to stop driving at sunset! One evening driving at night I came to an absolute standstill due to the headlights in the opposite lane.

A.286 March 31, 2025 — Cedar Lake, IN — Migraine

I am only 20 years old but I struggle so much with driving at night or on a cloudy day. Basically every single car (since they all have LEDs) blinds me as they drive past. Just looking at the side of the road doesn't work for me. It is impossible for me to see the road or anything else when there is a car with LEDs. It comes at me from cars driving towards me, through the rear view mirror, and the side windows. Also, the flashing LED lights for ambulances/police cars at intersections make me feel nauseous and like I am going to get a migraine. I have suffered from migraines for many years, so I am light sensitive. However, the LED lights are the worst thing for me during the day and night time.

A.287 March 31, 2025 — South Saint Paul, MN — Migraine

Light-triggered migraines with aura, I'm effectively blind for and hour following exposure, then typical migraine symptoms for 1-2 days. Have been restricted to side of road or parking lot unable to return home until aura passes. Headlights and some streetlights and home lighting trigger events.

A.288 March 31, 2025 — Southwest Harbor, ME — Other

I can barely drive during the “dark winter”. In Maine at Christmas time, dusk starts around 3:30. It is particularly difficult at Christmas time to drive. I am blinded. I did buy those “yellow glasses” that you can buy and it definitely helps, but it makes it difficult to wear my prescription glasses. I do not have to wear my prescription glasses legally, but I prefer to see as well as I can. Next year I don’t plan to go to Christmas events because I am so blinded by oncoming lights

April 2025

A.289 April 1, 2025 — Baltimore, MD — None

Not only are exceedingly bright and misaligned LED lights physically painful to my eyes, but the blinding glare from both oncoming cars and cars behind me make it so that I am unable to see properly while driving at night. It is genuinely dangerous. I have tried everything in my own capacity to diminish the effect of bright headlights on my ability to drive at night, such as changing lanes when possible, averting my eyes and focusing elsewhere on my surroundings, and changing the angle of my own mirrors. These solutions work minimally to alleviate the brightness issue and are dangerous to have to implement. In my Honda Civic, which is not an excessively low to the ground sedan, the majority of other cars I encounter on the road either have lights that are too bright or lights that are pointed directly in my eyes, and frequently both. The intensity of headlights needs to be regulated and the appropriate alignment of headlights needs to be enforced. I'm 24 years old and I have to avoid driving at night. It shouldn't be that way.

A.290 April 1, 2025 — Oceanside, CA — None

On my commute for the past 3 months, once sunset hits, all the bright led lights beam my face on the opposite side of the road , obstructing my vision. Basically the intesection of the main hwy is just a sea of bright lights that I sometimes duck my head under.

Oh and don't let it be some a hole behind you on the express way ... I've had more than a number of jerk drivers beam me from behind (one time is was for a legit reason)) but seriously who tf are these wanna be cops with their bright lights. At this point, I use anti glare shades or just beam my beams bac at them bc why not....

A.291 April 2, 2025 — Newman, MA — Astigmatism

I struggle with astigmatism and migraines. It is hard enough as it is to drive at night with these two setbacks but the LED lights make them considerably worse. LED lights are extremely ignorant and cause so many people distress and harm. I used to enjoy driving at night as a sense of peace and calm and now it causes me extreme distress and strain on my eyes. I have almost gotten into many accidents due to coming around a corner and these lights blinding me. If I have to drive at night, it comes to the point that even the lights behind me are so bright that I have to turn my side mirrors out of my sight or darken my rear view, which is not very safe either. Please make some sort of regulations for headlights or ,yet I say, ban these lights and bring back the soft yellow lights for everyone's safety.

A.292 April 3, 2025 — Mountain Home, AK — Autism

There's a newer model large truck that has very very bright led headlights. I dread running across him every weekday morning. One time I flashed my halogen headlights at him and he flashed his back and that's how I realized he didn't have his bright lights on, it's just his normal lights that are very very bright.

A.293 April 7, 2025 — Albany, NY — Photophobia

I have to drive, day and night, with one hand blocking my view of oncoming traffic. Sometimes I have to tilt my rear view completely to the side because up is not enough. I have debilitating migraines and laser to prevent narrow angle glaucoma. SUV, trucks and car of certain manufacture almost continuously assault my neurocortex. The terror and anxiety I experience driving decreases the quality of my life and I'm certain I will die or kill someone from being visually impaired by others cars. LED lights are a great a public health concern for all on the road as drunken drivers and car manufacturers must be held to account before further lives are lost and the precious ability to see and drive, walk safely is compromised. In the name of goodwill of man to man, all measures must be taken to stop the blue white fatal hellscape LED has made the roads

A.294 April 7, 2025 — Bremerton, WA — Autism

For the past seven years I've worn sunglasses when outside of my house, even at night due to prevalence and ubiquitousness of blinding LED lights on cars, my neighbor has an LED floodlight without any kind of diffusing, a blinding LED streetlight has replaced one of the older bulbs in the streetlights on the road outside of my house.... I'm living in an unregulated LED hellscape, the only relief for my eyes is not wear sunglasses at all times when outside of where I have direct control over all the lighting

A.295 April 7, 2025 — Brookings, OR — Electromagnetic Sensitivity

[My neighbor's] light, lights up my house and property. But instead of being a good neighbor, she defamed me on TikTok.

A.296 April 7, 2025 — Chicago, IL — Migraine

Oh my God where do I start everyday we wake up we have to deal with this it's affecting our mental health and our vision today on the way to work there was a guy behind me I slow down to let him pass he pulled up closer to me put on the extra super bright the lights that were on were already bright and he sat there behind me then he pulled up next to me and looked at me so now people are using it as a weapon they don't care there's no kindness or compassion there's no relatability to anyone else all that everyone is self-centered with these lights and this issue the ones who won't take them off in the daytime or you know when someone's coming towards them which they don't need amount of the day that's pretty stupid it shows how dumb society's gotten so now it's becoming more dangerous for me to travel the police here are not doing much I believe there's some laws in place in Illinois there's something that I found and I'm going to show it to them and they keep saying I know I know but they

don't do nothing laws are not good if they're not enforced it's going to turn the violence if it hasn't already

A.297 April 8, 2025 — Livonia, MI — Other

Had to go shopping yet our local Meijer here in Livonia on Middlebelt and Schoolcraft. I'm in the pet department looking for charcoal for our fish tank and Within minutes, I start getting this irritating, mild thumping pain behind my eyes. I'm thinking I'm having a stroke or something like that but The same thing happened to my wife a couple weeks ago and she realized the lighting so I just got out of there, reported it to the manager, and he kind of laughed it off.

A.298 April 8, 2025 — Orem, UT — Astigmatism

I was driving from Idaho to Utah after a family reunion. I was going through a mountain pass when all of the sudden, im blided by a line of LED headlights. I side swiped the concert barrier, not only damaging my car, but it made it difficult to pull over and assess the damage. It of course doesn't help with an astigmatism, but even with special glasses for it, LED headlights make it worse. I have to call my insurance tomorrow for the damage for my car because car companies don't give two shits about the drivers.

A.299 April 9, 2025 — Washington, DC — None

Not yet an incident - you need to get this out on every instance of the Nextdoor app in every city. Get more signatures!!

A.300 April 16, 2025 — Cincinnati, OH — Other

Today's automobiles, specifically SUVs made by Toyota, Hyundai, Kia, Honda and Acura have headlights that are WAY TOO BRIGHT!! When these vehicles come at you on a dark road, their light spread is literally blinding and especially on a rainy night, this has almost caused me to have a crash several times and always I'll see spots for several minutes after encountering one of these cars. I've noticed vision problems as well as increased frequency of headaches as of late and I have changed nothing in my lifestyle other than having greater exposure to these lights. And we shouldn't forget that the light bars on police vehicles and tow trucks are also retina-searing bright. We can see a flashing incandescent beacon on one of these cars from plenty of distance at night. This needs to be a class action suit against the auto manufacturers or the lamp manufacturers.

A.301 April 19, 2025 — Kalispell, MT — Autism

I'm tired of being blinded in the middle of town, day and night, with drivers in cars that are completely oblivious (or malicious) to the danger and pain they are causing others. I have had to stop dead in the middle of the road out of fear or driving off the road. Adaptive headlights are not a perfect solution, and after-market installs with no regular checks to ensure safety are putting so many people in danger. I had to quit my driving job because of the physical and mental toll this has caused me. I used to love driving at night, now I can't stand it. I wish someone with the power to make a change even cared.

A.302 April 19, 2025 — Key Largo, FL — Other

Health issues aside, to which there are many from LED's, there needs to be standardized warmer lights for our country at night. All the new vehicles with 5000 or 6000k lights are ruining our experience and our atmosphere. It is completely alien, cold, and soulless. Night driving used to be a beautiful experience. Now it looks like morgue lighting. Its an atrocity to the sensibilities of life on earth. It is damaging to our circadian rhythms and nervous systems and needs to be stopped. Please place rules on car manufacturers and cities to go back to warm lights.

A.303 April 19, 2025 — Salisbury, MD — Migraine

Bright LED lights triggered migraine started around 9:09 pm tonight after driving home from grocery store. These bright lights are ridiculous and cause "floaters" shortly after returning home I felt a headache coming on.

A.304 April 25, 2025 — Humboldt, TN — Other

Unable to see officers without reflective gear during accident events. Corner Mitchell and East St 1730.The officer had 3 units with Blinding strobes behind him. Washing him completely out of view in low light conditions.Especially for drivers of vehicles low to the ground. And Multiple units on site from other directions with Blinding strobes.

A.305 April 25, 2025 — Iselin, NJ — Other

I had optic neuritis and now have a blind spot in my left eye. Today I went into a department store and the flickering was so bad from the LED lights that my eyes started to flutter uncontrollably. I have never had this happen before today. I just happened to be under a flickering led light. They are awful, and I have trouble seeing with them.

A.306 April 25, 2025 — Wynantskill, NY — Other

Street light is EXTREMELY bright. Lighting up whole side of house flooding into rooms including two bedrooms. Interrupting people and pet natural rhythms . Hard on the eyes when walking and driving. Noted increase in agitation an anxiety. Town said they added light because kids were waiting for bus in the dark. Simply not true. At no time are kids waiting for bus in the dark (bus picks up kids after 7am). There has been little to no crime in this area for the 30 + years we've lived here. 3 generations of kids (including mine) have picked up the bus at that corner with no problems or concerns. A single recent new resident (who happens to be friends with the town supervisor) asked for the light to be installed. The other 3 residence on the corner do not want or see a need for the light. The other street light on the road are considerably less bright and are positioned over the road (not facing houses). There was no notification, or opportunity for discussion/debate on the installation. I wish there was a way to include a picture, Seeing research where this type of light has health implications which is concerning and stressful.

May 2025

A.307 May 3, 2025 — Seattle, WA — None

Blinded by lights in traffic, rendering inability to see where I am driving. Pain and danger. Even own rental car lights reflecting off of car in front of me blinds with daytime running lamps. Cannot turn off and end up having to slow dangerously on freeway.

A.308 May 5, 2025 — Chicago, IL — Electromagnetic Sensitivity

OMG where do I start?? Multiply this report for every day until this STOPS for GOOD!! We are living in a pure nightmare of torment and torture. We are being conditioned for insanity and violence. These lights have a strong effect on vision and brain and right now my head hurts as I saw the BRIGHTEST AND WORST EVER today!!! How are people allowed to harm us and use this as weapons!!???? What will we become??? Nothing done and it's getting worse and our freedom to drive is stolen at all times. This is just the beginning of worse. My sanity is almost gone.

A.309 May 20, 2025 — Kokomo, IN — (no category given)

These headlights give me a migraine every time. Whether it's a vehicle behind me, coming towards me, or in my line of vision at all. They blinding and definitely interfere with driving. I've had to pull over because of these. I just quit leaving my home at night. A migraine takes you down, fast, and for a couple of days. The so called safer visibility for the owners, well those are called "brights" to be used as necessary.

A.310 May 21, 2025 — Chicago, IL — Other

TODAY AS IN EVERY DAY!!!!! F*** my eyes!!! Seeing spots several super bright ignorants and NOTHING STILL being done !!!! They are conditioning us for insanity and violence. Why is the world doing this???????? I feel sorry for babies and animals who don't know NOT TO LOOK. Health is harmed and this is severely criminal by Feds and Automakers and Eye Dr's. ignoring this.

A.311 May 27, 2025 — Avon, MN — Astigmatism

I am middle-aged and have had keratoconus/astigmatism for at least 25 years. However, I have NEVER had so much difficulty with headlights as I have in recent years with the explosion of LEDs on

the road. Mind you, this is not just a night problem. I've already given up driving at night at this point. But DAYTIME driving is nearly intolerable as well, since these LEDs ARE ON ALL THE TIME. Although they are all too bright, some are very clearly worse than others, either because of their design or poorly placed after-market lights. Obviously, this is a regulatory FAILURE as our roads are a Wild West of mildly irritating to extremely glaring and dangerous lights with ZERO accountability for the offenders.

I wear layers of various tinted lenses to mitigate the problem, but for some lights, it is not enough. I often have to resort to holding up my hand to block the oncoming lights. This is obviously not ideal as it obscures a large portion of the road, but this is what you are forcing me to do. Add to that the tension and anxiety this triggers in me, and you have a recipe for increased accidents. ANGRY DRIVERS ARE NOT SAFE DRIVERS.

At this point, I don't dare take a job that isn't 100% work-from-home. You have needlessly constrained my options.

There was absolutely nothing wrong with incandescent headlights. LEDs are completely unnecessary, and manufacturers have been marketing these to Lazy Entitled Drivers. Serious regulation of these lights is LONG OVERDUE. Every day you fail to act, you are causing us harm.

A.312 May 27, 2025 — Woonona, NSW, Australia — Migraine

I have a condition which causes intense headaches and eyestrain when exposed to almost all OLED and, more recently, newer LCD panels (e.g. latest MacBooks), presumably due to PWM and/or PAR.

It has never occurred with CRTs or older displays. I have had extensive eye checks with multiple ophthalmologists, but they can find nothing wrong except mild astigmatism. The general diagnosis I have been given is "idiopathic migraines" and advice to "avoid such displays."

However, they are now everywhere. Apple, for example, doesn't make a single laptop or phone anymore that uses their older non-flickering tech. Other manufacturers are starting to do the same. There's no single flagship phone that doesn't use OLED with PWM. As my entire career has been built in IT, this is slowly becoming a huge concern. As the older hardware becomes outdated, breaks and becomes harder to find, I might find myself completely unable to interact with modern tech. I have written to accessibility teams at Apple, Google and Microsoft to ask for possible tuning options to no avail.

A.313 May 28, 2025 — Henrico, VA — None

Driving at night here is increasingly dangerous LED lights on any vehicle are 95% blinding to facing drivers. Many people drive with their bright lights turned on as well, it says if nobody is taught or educated how to drive anymore. So bright lights coupled with LED bulbs.. LEDs need to be banned that's the first step. The next step is to make sure every state mandates that lights be checked annually and pointed down towards the road. The third step is that every person has to know how to work the bright lights in their car and know when they should and should never use them.

A.314 May 30, 2025 — Milton, DE — Migraine

Our Small town in Milton Delaware has begun installation of LED lights on our residential streets. There’s lights are cause sleep disturbances and severe migraines. Walking the streets is like walking through a filly lit stadium. We live in the Broadkill River where birds migrate. We have all types of wildlife which will be negatively impacted by 150 W LED lamps.

June 2025

A.315 June 3, 2025 — Tomball, TX — Photophobia

My husband can't safely drive at night because of the bright lights. He often misses turns and scares me because he often has his mirrors turned away. I'm less sensitive to light, but I still have issues with lifted trucks ocassionally blinding me through my mirrors. When this happens, I literally can't see anything on the road and it's terrifying. This usually happens for 20+ seconds. Imagine not looking at the road for 20 whole seconds! Sounds dangerous, right?

A.316 June 4, 2025 — Fairfield, OH — None

Bright LED headlights are too bright for safe driving on the road. Every time a car with bright white LED headlights is driving behind me (either directly behind me or behind me in an adjacent lane), their blinding headlights reflect in my side mirrors and/or my rearview mirror and blind me. I have to switch lanes and/or speed up to put distance between myself and the LED car so I can see. Oncoming cars with LED headlights are just as bad. The lights come right at me and blind me. Many people driving cars with LED headlights do not know when to dim their lights. Often, they do not dim them at all, meaning that either they forgot their high beams were on or they only had low beams on to begin with and if the low beams are blinding me, that is a real safety issue. But even when oncoming drivers do dim their lights, it is often only once they have gotten close, because they do not realize that their high beams can blind people even far away. I have a really hard time driving safely when I cannot see the road, the cars, or the people in front of me due to other cars′ LED headlights either behind me or in front of me. I drive a high-seated car, a Ford Escape and cars of all sizes still blind me with their lights on level ground. It is way worse on uneven ground like on a hill.

I know I am not the only one who is blinded by LED headlights. I work at a restaurant and I often hear customers in the drive-thru complaining about the car behind them having their high beams on. When the offending car pulls up to the window, I let them know that their high beams may be on and they usually say they don′t have their high beams on; they just have LED headlights.

A.317 June 11, 2025 — Tulsa, OK — Astigmatism

Driving at night has become increasingly more dangerous for me. The glare LED headlights cause is blinding and even more so if it's raining. I feel like I'm driving blind when one of these vehicles with LEDs pass. It makes it hard to see medians, traffic lights, and pedestrians. Not to mention it hurts my eyes and my head.

A.318 June 13, 2025 — Bonney Lake, WA — None

Every single day I am blinded by white LED headlights. The worst ones will leave a burned in spot in my eyes for 5-10 minutes. And while I'm driving I am blinded for several seconds. Enough for hundreds of feet of blind driving and it's caused by these irresponsibly blinding headlights. Why can't we just put dimming and yellowing film on these headlights? Make it law.

A.319 June 18, 2025 — Chicago, IL — None

I really hope something gets done about the extreme bright headlights, I get totally blinded when I encounter one head on, just last night I was trying to turn left at an intersection and had to stay put til the car facing me was stopped also turning the other way , cars beeped their horns but I could not see a thing til the car turned. It a horrible feeling and only happens with very bright lights.

A.320 June 23, 2025 — Las Vegas, NV — Astigmatism

I am signing this petition because I believe modern LED headlights pose a serious danger to drivers at night. As someone who is required to drive after dark, I am regularly and severely affected by the intense brightness of these lights. I do not need to look directly at them to be blinded; simply being in their presence, whether from oncoming traffic or vehicles behind me, causes extreme visual discomfort and temporary vision impairment.

Just the other night, June 21, 2025, while yielding for a left turn, an oncoming vehicle's LED headlights were so overwhelmingly bright that I could not safely determine if another car was approaching and had to wait until the other car moved so I can "see". After making the turn, I continued seeing "afterimages", bluish spots that appear after staring at an intense light source, for three blocks. This is the same kind of retinal stress we were warned about as children when told not to stare at the sun or a light bulb to avoid permanent eye damage.

This is not an isolated event. Nearly every time I drive at night, I experience this blinding effect to the point where I feel it is unsafe to remain on the road. I have had to pull over or deflect light back at vehicles simply to maintain visibility at stoplights. Before 2012 here in Las Vegas, vehicles with such dangerous lights would be ticketed for failing safety standards and causing visual impairment to others on the road.

If drivers are legally prohibited from using high beams unless absolutely necessary, why are these ultra-bright LEDs permitted at all times? It feels like a double standard that prioritizes aesthetic or marketing trends over road safety.

I firmly believe that these headlights have contributed to the rapid decline of my vision. My astigmatism has worsened dramatically since I was forced to regularly drive under these conditions. The constant retinal stress and lingering afterimages cannot be harmless and may be causing long-term damage to countless drivers like myself.

I truly believe automakers and regulatory bodies should be held accountable for allowing such dangerous technology on public roads. At minimum, I would support serious restrictions and at maximum, I would support legal action against manufacturers for compromising public safety and health.

A.321 June 23, 2025 — Superior, CO — Migraine

I am prone to Migraines and have astigmatism. I moved about an hour away from my family for a job but still go visit for holidays, birthdays, or dinners. Driving home has become unbearable and puts me at risk of a migraine. My family has taken to planning things earlier in the day so I can drive home when it is still daylight out. Even then I will encounter cars whose LED lights are so bright they are blinding IN THE DAYLIGHT. How has this come to be?!?! PLEASE HELP!!

Incident report on Media due to lights causing death in Santa Barbara CA.....https://www.noozhawk.com/pedestrian-dies-after-being-struck-by-vehicle-on-calle-real-in-goleta/?utm_medium=email&utm_campaign=00a03ef2ba-EMAIL_CAMPAIGN_2025_06_23_07_50&utm_source=Noozhawk&utm_term=0_-00a03ef2ba-247218029

July 2025

A.324 July 6, 2025 — Oviedo, FL — Epilepsy

I have to constantly close my eyes where there might be flashing lights or cause me to avoid certain places which puts me in a down mood because I feel like I can’t even leave my house due to fear of having a seizure. It can be depressing since your social life is limited. I remember in the past being in a club and I had a seizure because they turn on their strobe lights. I wish they would just be banned completely since they are not good for the eyes and cause so much harm.

A.325 July 8, 2025 — Malden, MA — None

For years I thought all these people where driving around with high beams on!! I often find myself having a difficult time seeing after someone pulls in behind me with these LED lights. I'm thankful that I'm able to focus on the road but I now know others have not been so lucky. I don't even think most people are aware of thier bright head lights if they have them and when you're at the auto parts store you could easily buy a set of head lights that are WAY brighter then you'll ever need. Softer lights will definitely save lives and change them. I don't know how these bright lights are effecting wild life but if we're suffering, they probably are too.

A.326 July 10, 2025 — Vacaville, CA — Autism

I was at a restaurant when a woman at the next table turned on a device that was about the size of a cell phone, but had a ring of intense, blue-rich LED lights, acting something like a flashlight. I was struck directly by the LED lights, and a few seconds later began going into a panic and meltdown. I got up from the table and began breathing hard and made my way outside, and then collapsed to my knees and began crying.

A.327 July 15, 2025 — Sacramento, CA — Other

This July, 2023 study describes how an LED light can cause macular injury. (https://pmc.ncbi.nlm.nih.gov/articles/PMC10404656/). This report is contrary to the FDA's position that LEDs are benign and don't need regulation.

A.328 July 16, 2025 — Yuba City, CA — Other

My wife and I are in our 60s and the glare from LED headlights makes driving at night dangerous. Even looking at the fog line on the road isn't enough to mitigate the blinding glare on our rural two-lane roads. Pickup trucks, SUVs and Teslas seem to be the worst offenders. We do not have this problem with approaching vehicles using standard halogen headlights.

A.329 July 17, 2025 — Jacksonville, OR — Other

Driving home from the grocery store was blinded by LED lights from a passing truck. Roadway was two lanes, one in either direction... How anyone can conclude that intensely bright LED headlights are not problematic when they are temporarily blinding drivers, making driver avert their field of view, etc., is beyond me. What is wrong with this picture???

A.330 July 18, 2025 — Houston, TX — None

I was at a stoplight and a new truck pulled up and stopped behind me. The headlights were so bright in my mirrors that I had difficulty seeing ahead of me. I adjust the mirror inside for nighttime, but it wasn't enough the side mirrors, especially the driver's side was focusing the light into my eyes even while I wasn't using them. I adjusted them so that they were useless and I actually had to pull off the road and wait until I could see again.

A.331 July 24, 2025 — San Francisco, CA — Electromagnetic Sensitivity

I have nonionizing radiation sickness. I get migraines, sharp pains in my heart, heart and brain inflammation, it feels like a tight belt is strapped around my chest sometimes, I get full body inflammation, bloating, weakness, chronic fatigue, shortness of breath, muscle weakness, a feeling of hopelessness and desperation to escape this toxic environment, eye pain, floaters in my eyes, 'starburst' patterns of white light bursts when I close my eyes sometimes, hot and cold flashes, a sensation of being roasted in buildings with bright LED's, extreme thirst and need to urinate frequently in the presence of intense LED's.

A.332 July 29, 2025 — Chicago, IL — Astigmatism

BLINDED DAILY WITH SPOTS AFTERWARDS EVEN IN THE DAY!!!!!!!!!!

A.333 July 31, 2025 — Chicago, IL — Migraine

My place of employment has installed bright LEDs directly above and across from the service desk where I work, and I have had to call out sick due to migraines caused by them.

August 2025

A.334 August 6, 2025 — Cambridge, NY — Epilepsy

On Thursday, July 24 at about 11 am I was sitting on the front porch with my wife when a white Department of Public Works pick up truck drove by with its strobe lights flashing. This caused my wife instantly to have a seizure and during the seizure she fell to the floor hurting her arm, her hip and her knee. Fortunately the glass she was holding did not break when she dropped it. The DPW truck was travelling north. It did not seem to be related to any work going on on the street. I tried to make my wife comfortable on the porch and then when she regained consciousness I helped her into the front hall where she was at least safe from more strobing lights. It was several hours before she had recovered enough to speak, stand, or walk, and she was incapacitated with headaches and nausea for the rest of the day. We have spoken to the DPW, the Police Department, and the Village Board about this previously.

A.335 August 7, 2025 — Oakland City, IN — None

I was driving home and nearly missed a stop sign because I was unable to see it due to a police officer's headlights.

A.336 August 14, 2025 — Vista, CA — None

Within this month, there has been numerous incidents with those damn led headlights. They shine from either behind or taking them head on.Taking the LED headlights head on, made me pull over multiple times due to the fact that they're bright and blinding. I had to turn on the emergency lights one time when I was getting flashed both ways, one from my mirror and the other was from a truck. I thought I was meeting my maker due to the combination of how bright it was. These damn LEDs is just an accident waiting to happen, without studies, and proper research I want proof that LEDs don't harm the eyes physically or cause temporary blindness when driving.

A.337 August 18, 2025 — Chicago, IL — Other

PAIN IN EYES FROM SEVERAL EXTREME LED'S AT MY VISION. MULTIPLY MY DATE TIMES EVERY DAM DAY!!!!! MY VISION IS WORSE!!!!

A.338 August 23, 2025 — Hurley, WI — None

While looking left waiting for an extended period for traffic to pass before making a right turn on to a US highway on a darker cloudy afternoon, one semi with multiple, glaring LED headlights and one or two trucks passed by. Once I pulled on to the highway, I noticed that my vision seemed distorted a bit, and it lasted during the couple mile drive to work. Once I got back into the office, I noticed visual disturbances in both eyes, kind of a pulsating disturbance on the periphery of my eyesight and a blank spot head on. After about 1/2 hour of anxiety and closing my eyes, the disturbances dissipated, and I came to the realization that I was even though I was not looking directly into the bright LEDs, that the intense light likely got into my eye causing disturbances in both eyes.

A.339 August 24, 2025 — Edgewater, FL — Photophobia

I bought a home in a beautiful retirement community where we all have a lamp post in the small front yard we have. My neighbors have recently changed out their lamp post to LED lights with clear glass. Our lampposts are at eye level. I have Photo sensitivity where just a glance at an LED light burns my retinas, then causes migraine headaches for days. I thought I could live in this community for the rest of my retired life but now at age 70 I have to move somewhere safe. I am so sad, please bring back incandescent lights so I can live out my life without this agony. Thank you

A.340 August 30, 2025 — Portland, OR — Migraine

I am regularly blinded by LED headlights. This is problematic in the wintertime when the sun sets at 4:30pm and it rains nonstop.

A new issue has arisen, however. As LED headlights go out they develope a strobing effect similar to flouresent bulbs as they die. This leads to vehicles on the road with high intensity strobe lights. I suffer photosensitive migraines with an aura that interupts my vision, rendering me near blind. I've never been triggered by halogen bulbs, but the prevalence of LED headlights on the road has made driving dangerous to myself amd others. I, like many americans, am not so privledged that I can give up driving. My livelihood depends on reliable transportation.

As LED research brings in new data, such as macular eye injuries from short term exposure, as well as the higher sensitivity the human eye has to blue light wavelengths, it is abundently clear the FDA needs to reevaluate the safety of LED headlights. It is negligence on their part. We are 15 years behind the rest of the world in mitigating the dangers overly bright headlights pose.

That LED headlights strobe as they die, a problem not seen with halogen bulbs, is a clear and direct violation of the ADA, and if changes aren't made soon, A class action lawsuit is inevitable.

https://media.rac.co.uk/blinded-by-the-lights-nearly-one-in-four-drivers-think-most-car-headlights-are-too-bright-3166996

September 2025

A.341 September 3, 2025 — Smyrna, GA — Astigmatism

I was on a two lane road in the middle of the night, and it was foggy. I'm not sure if their high beams were on or if it was their regular lights (which is another issue. Your regular lights shouldn't be so bright that I think it could be high beams) but the headlights mixed with the haze of the fog made it so

bright that I basically had to come to a stop before I could proceed. I couldn't see the road! It was honestly dangerous because if someone was behind me I could have been hit since they wouldn't have been expecting me to stop like that, OR they might have been blinded by the lights too and not realized I was stopping.

A.342 September 4, 2025 — Chicago, IL — Other

OMG tonight while riding my bike down non busy side street 2 cars with BLINDING LIGHTS ALMOST HIT ME!!!!! GOD DAMMIT DO SOMETHNG NOW DO I HAVE TO DIE LIKE OTHERS???

A.343 September 5, 2025 — Sausalito, CA — Other

Our city replaced the warm lights of our street poles with LED. They stream into our homes and surrounding environment. I am working hard to try to get them to rectify this, so the light is no longer blinding me when I look out of my window (which is unavoidable considering how small my home is). I have PTSD and photophobia at times (sensitive to light). This gives me anxiety at night and mild headache.

A.344 September 9, 2025 — Woodland, CA — Autism

I went to the health clinic to have my eyes checked. The clinician had me put my chin on a chinrest in a device that they called an optomap. They then moved the machine around until a blue LED light entered my eye. I closed my eyes because it was too bright. The clinician told me that I had to open my eye. When I opened my eye, the blue LED light was aimed directly into my right eye from a few inches away. The intensity of the blue LED light caused me to leap out of my chair, yell profanity, wander down the hallway, fall to the floor and start crying. The health clinic then told me that the eye doctor refused to see me and they sent up a security guard and I was kicked out of the clinic.

A.345 September 12, 2025 — Washington, DC — Migraine

I have had issues with LED headlights for years - they're often so blinding that I can't see well when I drive on dark roads at night, and they leave afterimages for sometimes minutes after exposure, but today I had a specific incident that triggered a migraine, something that has never happened before.

I was in the grocery store's parking garage this morning, and an SUV across from me was backed into a spot with their headlights facing outwards, directly at my car. For some reason, they had both their LED headlights and their brights on, and they sat there without leaving for several minutes. I waited a bit and finally had to back out of my parking space into the direct light, and I unfortunately have an older car without a backup camera - so I had to look.

Not only did I have to pull over after leaving the parking garage to be able to see again and let the afterimages fade, but I also began to get a migraine about 10 minutes later that has lasted most of the day, making me unable to work. Drivers are by nature going to do irrational and strange things - but LED headlights are a serious health and safety hazard that needs to be addressed, either on the state or federal level.

A.346 September 13, 2025 — Parrish, FL — Astigmatism

I recently began a position where I commute home around midnight after working my shift at the hospital. I have had multiple incidents where cars surrounding me on the roadway either approach me from the opposite direction or pull up behind me with extremely bright LED headlights. These headlights are significantly brighter even than roadway lamps or any other cars' headlights. I find that my eyes are blinded to the point where I struggle to see safely see other vehicles on the road and certainly to see the vehicle itself and perceive its depth or distance from me. I wear corrective lenses and have perfect vision while wearing them, but feel these headlights pose a grave danger to other drivers on the road.

I also have noticed an increased number of roadway lamps that are purple or deep blue in color which are clearly LED lamps. They do not illuminate the roadway but in fact make the surrounding areas seem even darker. It is difficult to distinguish other vehicles and certainly pedestrians when these roadway lamps are used. It is drastically easier to see under truly bright lamps.

I worry that prioritizing cost-effectiveness of LED lamp bulbs versus roadway safety is ultimately a potentially deadly and terribly unwise decision.

A.347 September 14, 2025 — Copake, NY — None

Within the last couple of weeks I went from driving a small SUV to a low, flat wagon- both of these cars are from the mid 90′s. I live in a rural area where people have more dollars than sense, coming from both sides of the political divide. The villages and hamlets where we live are 20 to 30 minutes away from each other. Taking a route last night I′ve driven many times, I was tailgated by pick-up trucks, three in a row, all using bright-hot white LED′s. Since my new car is lower, I am noticing the problem more than before. I really, really could not see. The closer the tailgaters got to me, the more I had to slow down. For quite a distance there was nowhere to pull over. Finally, I let one of the trucks go around me. By the time I got home from what had been a pleasant evening, I was extremely stressed-out.

LED′s, in combination with grotesquely large vehicles, are contributing to an air of aggression and hostility, all hidden behind anonymity. With such enormous beasts at their disposal, people are given more power than they should have. Just because they have money, it doesn′t mean they should have the opportunity to dominate and ruin other peoples′ lives. We all share the planet together. There should be room for people who want to drive smaller, more sensible and economical cars. The auto industry is a shadow of its former self, existing only to serve its greedy ends. The idea that LED′s are here to save us from climate change is big, fat joke.

In a couple of weeks I′m supposed to start a job, two evenings a week, a half hour away. With shorter days coming, I am worried about the drive home. I already work one evening a week at another job, also a half hour away. None of my friends who are older drive at night any more. With each year I see the problem worsening. Automobile manufacturers must be held accountable for the enormous problem they have created. It′s dehumanizing and it′s disgusting.

A.348 September 15, 2025 — North Canton, OH — Migraine

I have both migraines and astigmatism. The lights caused me to temporary legal blind while driving, which is unsafe. Also makes it difficult to find where I need to turn

A.349 September 15, 2025 — Sacramento, CA — Autism

I was traveling North on I-15 between Sacramento and Woodland, when the traffic slowed due to a crash. As we approached the crash driving slowly, a CHP motorcycle suddenly came into view that was using auxiliary blue LED flashing lights. The sudden impact of the extreme-luminance light knocked me backwards into my seat. I grunted in agony, and closed my eyes. After several seconds, I squinted my eyes open again and kept my left eye closed to enable me to drive past the motorcycle.

A.350 September 17, 2025 — Poway, CA — None

The headlights of other cars are so bright I cannot see the road properly. In addition, the automatic switching to high beams is blinding and very dangerous. Who signed off on these lights without first assessing whether they decreased traffic safety.

A.351 September 18, 2025 — Woodland, CA — Autism

As I drove through town, I heard emergency vehicle sirens, and then I saw two fire trucks turn towards me with dozens of intense red LED flashing lights that overwhelmed my senses and caused me to stop my car in the middle of the road, close my eyes as tight as possible, and put my fingers in my ears. My heart rate increased dramatically and I went into a panic. I attempted to squint open my eyes, but it was impossible and terrifying. I waited for the sirens to fade and when I opened my eyes, I saw that traffic was backing up behind me. I pulled into a parking lot. Afterwards, I was like a zombie and it took me hours to recover from the trauma.

A.352 September 20, 2025 — San Francisco, CA — Electromagnetic Sensitivity

I stayed in a rural area with few LED′s to recover my health from radiation sickness due to high density LED′s in my city, San Francisco. Before I left SF, I could barely walk as I had little energy and my muscles were very weak. I had to drag my body to walk to the store. I′ve lived here for about 30 years. I walked briskly to the store all the years, until recently. I could tell they turned up the power

on the 5G LED grid because my symptoms became far worse and my download speeds became much faster. I had a hard time staying awake. If I drove ten minutes to the beach, I was zapped so much by the LED lights on the way, that I could only sit and sleep when I arrived. It was very tiring just to walk across the street to use the restroom. My body would be severely bloated, and I'd have a migraine.

I feel more energetic now, after a two week rest in the countryside.

A.353 September 23, 2025 — Chicago, IL — Other

Pain in my eye from all day and part of the night getting hit physically by white light like flares or welders my eyes actually hurt today that's how bad it was and I almost hit a couple with a baby walking across the street from all this stress of driving distraction not only does it kill our vision it just it's a distraction it's a danger and it's a crime and no agency is stopping a regulating this things will escalate and it's gotten much worse in Chicago it's absolutely horrible how people act here they don't even care about what they're doing they see it too and they just don't care people are not human anymore

A.354 September 23, 2025 — Lake Ariel, PA — Astigmatism

I am a commercial trucker and these headlights -especially the giant, ornamental displays that people with phallic sorts of size insecurity issues attach to their lifted pickup trucks- are a regular hazard every single time I drive after dark. Seeing road signs, approaching road hazards, stopped traffic, and pedestrians is impossible to many tens of thousands of truckers a few dozen times per shift, especially a shift when it rains.

It does not take a genius (not that this one particular iteration of our federal government is blessed with many of those) to figure out that dozens of accidents a night are caused by this issue, one whose contributions to accidents are routinely ignored by the responding officers. Hundreds of lives per year are undoubtedly lost or irreparably altered when an 80,000 pound truck's driver is rendered blind by people who need attention and by an auto industry whose commitment to safety is somewhat further down theist from "profit" on their list of priorities.

Everyone on every roadway is at risk of being killed by a truck because of these lights.

A.355 September 24, 2025 — South Lake Tahoe, CA — Autism

I attempted to walk down the third floor hallway to my room at the Hampton Inn in South Lake Tahoe. The hallway was filled with 3000K high-luminance LED lights that were unshielded. I felt like I was walking through a radiation bath. I covered my eyes, but by the time I reached my room, I was nauseous and entering into a panic attack. I was unable to stay at the hotel.

A.356 September 25, 2025 — Wasilla, AK — Photophobia

I was sitting in my friend's living room. A van pulled in the driveway. I was wearing my blue light blocking glasses, but I accidentally looked at the van when it pulled in. I accidentally looked directly at the light. I immediately got severe eye pain and a headache that lasted for several hours. My vision faded, as it does immediately with "white" or blue LED exposure. My doctors say I need to avoid lights that hurt me because it is causing my remaining vision to fade. "White" and blue LED lighting in public means I do not have access to public places, and the accidental exposures that come to me are causing me to become more blind.

A.357 September 30, 2025 — Tipton, IA — Electromagnetic Sensitivity

I am highly sensitive to the visible light radiation emitted by Light Emitting Diode ("LED") products and have suffered adverse reactions when exposed to many types of LED products. My adverse reactions include pain and tightness in my suboccipital muscles and neck, vertigo, dizziness, and migraines. This impacts my life negatively in limiting my mobility, and my work and home life significantly. Many regular activities are negatively impacted and are limited for weeks or months after significant exposure, or I can no longer participate in these activities depending the severity of the exposure.

October 2025

A.358 October 1, 2025 — Huntsville, AL — Other

Caused Stanley to have a car wreck coming down Monte Santo mountain in rush hour traffic, eye sight issues due to age however inside a curve these headlights cause complete loss of vision rendering the drivers in incoming traffic to be 100% blinded. It's unnecessary for drivers to be using extremely bright headlights which is stronger then high beams. Car flipped almost killing Stanley

A.359 October 2, 2025 — Mobile, AL — Astigmatism

These bright lights are so dangerous. While driving when dark out I am blinded for several seconds when these cars pass me or are in my rear view or while at stop light across the way from me. Then for several minutes my eyes struggle to adjust back to normal. These lights are seen on more and more cars making the issue even more dangerous. When being hit with this intensely bright beams I fear every time that I will drift into that car or off the road because every thing becomes white until the car or cars pass. These dangerous lights need to be banned for the safety of drivers.

A.360 October 3, 2025 — Los Angeles, CA — Electromagnetic Sensitivity

very bright LED lights in Costco in Inglewood. after half hour in the store causing headaches, dizziness.

A.361 October 7, 2025 — Kihei, HI — Migraine

These new LED lights have impacted my life in that I had to stop driving in the dark completely! Not just that suddenly being blinded by these lights can cause an accident, they also trigger migraine headaches for me.

A.362 October 10, 2025 — Pflugerville, TX — None

Over the last few years especially, super bright white LED headlights blind me every single night when I drive. I drive a lower car (Honda Civic), and when any newer car (especially Teslas, trucks, SUVs) is behind me, I need to not only turn my rearview mirror reflector on (fine, I guess…), but also need to cover my left eye due to the headlight reflecting in my left side mirror. It's not only really frustrating, but really dangerous. It feels like all new cars always have their brights on (not sure if they are actually brights or just normal headlights).

It would probably at least help if they were a warmer color, as the pure white light is much more blinding. But the brightness seems too strong as well.

A.363 October 12, 2025 — San Antonio, TX — Astigmatism

I have both astigmatism and autism. I drove to work the other day while it was still dark out, around 6:30am. I have a 1999 car, my high beams are nowhere even near these new cars' low beams!!! The amount of times I was blinded was insane. I was extremely anxious and was going a lot under the speed limit because I literally couldn't see and there was nowhere to pull over. I'm pregnant with my first child. It's extremely unsafe to have such blinding headlights on the road.

A.364 October 14, 2025 — Warren, NJ — Astigmatism

LED headlights in the cars driving in the opposite direction caused me to end up in an accident that totaled my vehicle. I was driving home from work after sunset on a road that has very few streetlights. So after passing another vehicle, it feels like (despite my own vehicle having partially-LED headlights) going back to nearly pitch black while my eyes adjust. Because of this 5 seconds of adjustment my eyes take to be able to see ANYTHING on the roads, I did not see a deer running across the road until it was too late to avoid it.

I have both astigmatism and light eyes so my vision is very easily effected by overly bright lights and how long it takes for my eyes to refocus after being blinded by lights. I am lucky that it was a deer that ran out and not a human because otherwise, I fear I would be in prison right now because of these headlights causing my accident. How many people currently are in prison for that, I wonder? How many children and adults will have to die or experience life-altering injuries for legislation to be put in place to protect them and all drivers?

A.365 October 14, 2025 — Woodland, CA — Autism

On October 14, 2025, at approximately 11am, I was traveling east on Gibson Road near Hwy 113. About 1/4 mile ahead of me, I saw extremely intense flashing yellow lights. The sky was overcast, creating a stark contrast between the ambient light and the LED flashing lights As I approached, I saw that the flashing lights were from a Woodland police vehicle, and that there were blue, red, and yellow flashing lights. The vehicle was in the right lane. To be able to navigate past the flashing lights, I closed my left eye, pulled down my visor, and raised my right arm. I slowed to approximately 10 mph and attempted to look straight ahead. However, when I was just a few feet from the police vehicle, I was struck by the intense flashing light from the side of the vehicle and felt a sharp pain in my eye, like a needle stabbing me. I yelled out in agony. I was able to proceed forward, but was left with lingering psychological trauma and I felt that I was in shock.

A.366 October 15, 2025 — Barron, WI — Photophobia

Blinding, pain. A police officer pulled me over, and was highly concerned that I could cause an accident by flashing my brights at him. He did not give me a ticket. If he is so concerned about this issue, they should change out their lights to the old halogen lights. He said that it's the new LED lights fault and there's nothing he can do about it. This is freaking America. Can we not do something to help people be able to drive at night without being blinded?

November 2025

A.367 November 4, 2025 — Lancaster, ON, Canada — Electromagnetic Sensitivity

I can hear the radiation. I know immediately when Laser Emitting Diodes are on. They screech at temperatures upwards of 5000. The tinnitus is my ears hearing the diodes. Blue spectrum, being THz radiation can cook skin, see through material, and when it goes through my walls or comes through the windows, those optical lasers that are being fired 20,000,000 times per second, burn my skin, bruising pain on my legs, the feeling of a tumor growing in my head(at different areas depending where it's coming from), instant what I would call temporary arthritis in my knuckles and hips, shoulders, and ankles, bone on bone pain in my knees, vertigo if standing, pain like needles in the eyes, burning of the eyes. I find my gums start to get super inflamed and the roots of my teeth are being cooked as well as my cheek bones. I lost one vehicle because the highway salt trucks had its entire back wall lit up with yellow LED completely blinding me. I don't drive anymore. Nevermind the fact that the American Medical Association put out an industry wide warning in 2016 that LED cause glioma, leukemia, pancreatic cancer, testicular and ovarian cancer, cancer of the eyes, and the list goes on. Nevermind that a prominent medical association in France concurred with their findings. And, of course nevermind the fact that a prominent Spanish medical association came to the same findings. .Radiation amplifies radiation. Add in RFR, infrared, altimeters, smart meters, NAV systems, towers. modems and baby monitors and you've got one hell of an electromagnetic invisible flux chaotic super smoggy storm. And people wonder why I am an insomniac!

A.368 November 6, 2025 — Vista, CA — Migraine

These bright LED headlights are out of control!!! I fear for my life when I'm blinded and can no longer see the road. I have to drive with sunglasses to reduce the strain on my eyes but this makes seeing pedestrian's and cyclists hard to see but the bright LED lights also make pedestrian's and cyclists difficult to see when I'm blinded by oncoming traffic so there's no winning in this situation. "Yellow night glasses" do nothing so I'm stuck with sunglasses and interior lights on in the car at night. I have accidentally gone over a median onto the other side of the road because I was completely blinded by the brightness of a supernova. I come home with migraines most nights. Ban bright LED headlights NOW!!

A.369 November 9, 2025 — Cincinnati, OH — Electromagnetic Sensitivity

I was driving home Friday night at about 7pm and it was dark and I was coming around a curve that also was coming downhill and was blinded by LED headlights and almost went off the road and down the ravine because of being blinded by the LED headlights shining directly into my eyes. Most of the time I try to look away which isn't safe when driving because they are blinding and completely disorienting and give me a headache, but when driving on curvy or hilly roads you don't have the option to just look away for a moment. These LED headlights must be banned in the name of safety

on the roads or you are going to cause many serious and fatal car accidents. Also, I was at my moms visiting for a couple weeks recently and was dealing with brain fog, fatigue, sleep issues, and severe anxiety. I couldn't understand why as I travel to my mom's house in the country to escape all the cell towers and Smart meters in the city. Then I discovered that she had LED light bulbs in her lamps that I was reading next to all the time. These lightbulbs emit RF radiation and damage the eyes and brain and irritate the nervous system with their constant flickering. You must bring back the old incandescent bulbs and make them affordable for everyone not just the wealthy.

A.370 November 11, 2025 — Davis, CA — Autism

I was driving and came to a stop at a traffic signal, about three vehicles behind a fire truck. Suddenly, the fire truck turned on several extremely intense red LED flashing lights. The sudden shock caused me to scream in agony, and then a few seconds later I began crying uncontrollably.

A.371 November 11, 2025 — San Francisco, CA — Migraine

Driving ~45 minutes at night in the city gives me blurred vision and headaches for the next several days due to the intense lights, especially the LED headlights shining into my eyes. It also feels very dangerous as the hills in San Francisco often cause car headlights to shine directly in your face. Walking in the city at night similarly bothers my eyes because of the intensely bright street lamps.

A.372 November 13, 2025 — Jackson, CA — None

It's made driving home in winter nerve-racking and dangerous. It's dark and rainy and the opposing traffic has leds and the traffic behind me have leds. I can't see. I just can't. Today I totally lost the lines and 100% could not see them. I'm scared. I can't keep driving out here like this. I'm gonna get killed by these headlights.

A.373 November 15, 2025 — Burbank, CA — Electromagnetic Sensitivity

Frequently when driving on long trips at night I encounter drivers with extra bright lights. If they are close enough to me I and up getting blinded and I find it impossible to safely change lanes to get free of it. Most recently this happened on a return trip from seeing my mother.vvits a long trip, but it's important that I visit her as my father has passed on and she needs more contact with family to stay healthy.

A.374 November 15, 2025 — Sacramento, CA — Other

Purchased home 1984 and for over 30 years street light shared with next door neighbor providing wonderfully bright, safe, non-intrusive lighting. Then we received notice in the mail around 2015 that new LED lights would be installed on poll replacing old (working just fine!) incandescent bulbs. The project throughout our suburb and beyond took 5 months to reach our street with 3 such light polls covering 18 houses. Every resident shocked how much less coverage and less bright the LED lights were. Less than 50% as bright as before. Effectively they are useless as far as night time safety purpose and if polls were completely removed no one would hardly notice. Another failure by government do-gooders who ruin as much as they improve things.

A.375 November 16, 2025 — Adrian, MO — Astigmatism

I hate these bright LED blue headlamps and street lights they are extremely blinding and distracting and create hazards when driving. I drive at night for my work and this puts a big strain om my eyes. Many times I have to stop and let oncoming traffic pass by on 2 lane blacktops because I can't see. Also it causes me stress when cars approach me from behind with these car lights and I often have to speed up to get some distance between my car and the vehicle behind me just so I can see and get away from the lights reflecting in my mirrors. This could put me at risk for an accident because often deer and other animals cross the road at night. I hope the industry examines the hazards associated with these type of lights and puts consumer safety first.

A.376 November 16, 2025 — Anonymous — (no category given)

Blinding light. Complete vision obstruction. Crossing a four lane interstate and stuck in the middle to cross the highway. I couldn't see a thing as a trucks lights blinded me at the stop light across the hwy! This is a busy highway. I had to sit there blocking traffic east and west. I wasn't about to pull out onto the hwy and cause a tragic accident. As the truck inched forward I put my hand up and covered my

eyes enough to get across. I was so shook up I had to pull into a business lot and calm down. LED LIGHTS ARE LIKE HAVING an LED FLASHLIGHT POINTED RIGHT IN YOUR EYES! It's also abuse to anyone with the slightest vision impairments. You can no longer drive at night and could actually run a pedestrian or bike rider over. You cannot SEE! ESPECIALLY if trucks with lift kits DO NOT ADJUST THEIR HEADLIGHTS! Yes, people are that dumb! Very dangerous! Also our neighbors lit their front yard up like a prison with LED! THEIR YARD LIGHTS LIGHT UP OUR WHOLE HOUSE INSIDE! WE HAVE TO SHUT ALL OUR BLINDS AND CAN NO LONGER ENJOY THE STARS AND MOON! I despise LED!

A.377 November 16, 2025 — Anytown, AL — (no category given)

Blinding LED Lights on vehicles causing severe dangerous vision issues while meeting oncoming vehicles on roadway

A.378 November 16, 2025 — Centreville, VA — Astigmatism

I only have a minor astigmatism in one eye, but the LED lights in modern cars are so bright that the glare can completely obscure both the lines on the road and potential pedestrians/obstacles. I find myself squinting and physically lifting my hand to block the worst of it, especially when a large truck is either right behind me or included amongst oncoming traffic. Driving in the DMV area is dangerous enough with the number of cars on the road. There is absolutely no need for these intense blue/white lights.

A.379 November 16, 2025 — Chico, CA — Migraine

Eyes are burning. Eyesight is deminished and compromised. Blurred vision. And migraine headaches. Headlights are blinding, and cause burning in eyes. Cause migraine headaches, and insomnia, lack of focus and confusion. Thank you!

A.380 November 16, 2025 — Clearwater, FL — Other

There were lights installed on the causeway between Largo , Florida and the Belleair Beach area. These new lights had a purplish color and I looked that the lights a strong nausea turned on. This nausea would stop if I looked away. These lights were eventually changed back to the normal color and no nausea occurred when now looking at the lights.

A.381 November 16, 2025 — Fairbanks, AK — Other

Floaters in my left eye have appeared almost instantly after installing led desk lighting along with headaches that I never get. Please bring back incandescent lighting. Bring back our "Fundamentals " please. Thank you

Diabetic

A.383 November 16, 2025 — Las Vegas, NV — Other

Overt light pollution..effect on eyes when driving at night..blinding lights from on coming traffic..also blinding from side view mirrors..making me see spots at times after being blinded..makes for unsafe driving conditions. Highway patrol lights have the same affect..at time even worse if strobes are in action..these lights present a hazard to all driving the roads..they shall be illegal on vehicles..

A.384 November 16, 2025 — McGregor, MN — Migraine

They are horrible and getting worse every day. I have to drive more at night now and there and too many cars with headlights not angled down or too bright of an LED light. It is to the point of constant headaches and dizziness while driving which is unsafe as I drive my children

A.385 November 16, 2025 — Peabody, MA — None

Since the bright LED have been put in cars I can no longer drive at night. I have been blinded by the light and white knuckled the steering wheel until car or cars pass. The combination of the rain and blue lights is so dangerous for my vision I won't go out. I do not have this trouble with the older yellow lights. I also have tried using LED book lights, the strobing makes it difficult to use and generally wait for the daylight.

A.386 November 16, 2025 — Readington, NJ — Astigmatism

They installed led lights in my favorite library. The overhead light is so bright, I can't read the spines of the books on the shelves. It hurts my eyes and gives me a migraine to even look toward the shelves. I need polarized sunglasses to enter the library!

A.387 November 16, 2025 — Scappoose, OR — (no category given)

The new LED lights on cars are horrendous, way too bright, which impacts visibility and driver safety. Makes it way harder to drive at night. I have been forced to wear slightly tinted sunglasses at night when I'm driving . Also, I work at a hospital and they decided to put bright white LED lights in the laboratory I work at. They are 3 to 4 times brighter than the old lights. I know this because I brought any Lux meter and tested them . I made complaints to management and they did nothing . Since the hospital has installed these new LED lights I have had to have special prescription glasses made with slightly tinted lenses so that I can make it through the work day. These lights cause me fatigue ,irritability, severe eye fatigue, nauseous, headaches, anxiety. I come into work feeling great and by the time I leave I feel extremely tired and fatigued. It's getting to the point where I'm starting to think about a new career. Please do something about these horrendous lights , they are not good for us!

A.388 November 16, 2025 — Walnut Creek, CA — Other

I've noticed two things. 1- I can feel a negative effect on my skin. Feels very hot almost like I'm under a food warmer at a restaurant. Two- I listen to am radio at work daily. When I turn on the led lights in a house the radio goes static. I believe these led lights cast a frequency that interferes with the am signal. Since the human body is made of frequency and chemistry there must be an effect there!

A.389 November 16, 2025 — Wappinger Falls, NY — (no category given)

Cars behind me while driving emitt such high light output onto my side mirrors it is literally blinding. Unable to see oncoming traffic. Also oncoming traffic especially in rain or snow. Studies show amber light is better and doesn't reflect so much.

A.390 November 16, 2025 — Westminster, CA — Astigmatism

Every time I drive at night, I have to either hold my hand OR a piece of cardboard in front of me to avoid my eyes from being accosted. When my eyes are exposed to this overly BRIGHT light, they cannot adjust fast enough to the night. Is this safe? PLEASE rethink these hazardous lights for driving. Example: when you have your eyes dialated...do you go right out into the sunlight? NO of course not.. you wear protection, sunglasses! So now you are requiring us to wear sunglasses at night!!! Because of these hazardous lights, our freeways are having to raise the height of the center dividers. The COSTS of this could have been better spent on pavement refurbishment

A.391 November 17, 2025 — Austin, TX — Other

I try to avoid driving at night. Every time a newer vehicle is driving toward me I am unable to see the road in front of me, and am still somewhat impaired after they have passed. I have to literally shield my eyes with my hand and look down and follow the yellow line to stay in my lane, praying nothing happens on the road in front of me such as a stopped car, or wildlife passing in front of me ... until I can "see" again after my eyes adjust from "glare blindness".

When a vehicle, especially a pickup or commercial truck is behind me, I have to flip my rear view and readjust my side mirror so the lights are out of my eyes since it's very blinding to the darkness outside my windshield. As you might imagine, that makes it very difficult to drive safely. It's blinding and i can't see what's in the darkness next to me. This is especially problematic driving at night in the country or suburbs. There needs to be a limit on the lumens allowed for lights on cars and get rid of these blinding blue white lights!

A.392 November 17, 2025 — Edgewater, FL — Migraine

My neighbor across the street used over 200 LED lights on his home to decorate for Christmas. I have photo sensitivity and get migraines from the exposure. I have spent hundreds of dollars trying to protect myself and have failed. I had to sell my home and bought a home with an empty lot across the street.

A.393 November 17, 2025 — Knox, ME — Electromagnetic Sensivity

The intensity of LED car headlights is so dangerous it's caused me to avoid driving at night if at all possible. And LEDs at home are equally disturbing; the flicker and depth of the blue/white light cause me to lose my balance and feel as if I'm falling forward. I've been experiencing the dizziness for several years, about the same time we were forced to convert to LEDs. Docs have said it's a thyroid condition. I work at a historic preservation site and we only use incandescents there (when we can get them) and I find the rooms w/incandescents are MUCH more comforting and relaxing to be in. All in favor of incandescents! Thanks for the opportunity to say.

A.394 November 17, 2025 — Los Angeles, CA — Migraine

LED's are destroying my life. I'm struggling driving at night. Car's are blinding, trucks strobe, & it's making night time driving nearly impossible. People can't see half the stuff on the road & it's making life very difficult. Cheap LED lights are being advertised as "flicker-free" & they continue to flicker all across the worsening state of California. These lights are making it impossible to continue every-day tasks at night, giving my husband & I migraines, & destroying every walk of life. Having an astigmatism doesn't help in the slightest. It's making our lives, family, & friends miserable on a daily/nightly basis. I thought this was a problem on the west coast, & it seems to be affecting every walk of life in the United States. So happy you guys started this foundation to speak for those who are struggling with the extremely harmful effects of LED lighting. Just know, you are all not alone with this issue. Let's get this problem solved together!

A.395 November 17, 2025 — Rockwood, TN — Migraine

LEDs cause significant impact to my life. It is very difficult to drive at night with the LED headlights being too bright and causing dangerous situations as my eyes readjust. In addition, the large LED lights on the side of the road are a safety issue. Please consider a step forward so the nights are safe for all of us.

A.396 November 17, 2025 — Tucson, AZ — Photophobia

Way too bright LED lights in car behind me were affecting my ability to see additional vehicles in all three lanes traveling in my direction.

A.397 November 18, 2025 — Belpre, OH — Photophobia

The bright white LED headlights and streetlights that are everywhere now have made night driving genuinely miserable for me. They're painfully intense; when a car approaches, the glare floods my vision, forces me to squint or look away, and leaves big streaks across my eyes that take far too long to fade. Judging distance and speed is so much harder—oncoming traffic often looks like a wall of light instead of individual vehicles, which makes pulling out or changing lanes feel risky. One direct hit from those headlights completely trashes my night vision for minutes afterward, leaving everything else in the dark looking blacked-out by comparison. It's not just annoying anymore; it's stressful enough that I now avoid driving after sunset whenever I possibly can.

A.398 November 18, 2025 — Saint Petersburg, FL — None

While riding my motorcycle home a pickup truck entered the roadway behind me. He had a light bar that spanned the entire width of the truck on the roof, and a SECOND bar on the hood. Had all of these lights on behind me. I was blinded and literally could not see in front of me. The glare in my mirrors was so bright it interfered with my vision, which caused me to start losing balance and tipping over because I could not visually orient myself. I had to change lanes and focus my vision on the curb next to my front tire, release the throttle and slow to below 30mph and let him pass. Despite him passing, I'm seeing spots due to the brightness I experienced and had to continue another 2 blocks below 30 mph until my eyes adjusted again from the massive glare. VERY dangerous when riding on 2 wheels. (Wondering who will say it is my fault for choosing to ride on two wheels instead of four).

I understand that we are allowed to accessorize our vehicles as we want, but why is law enforcement not stopping vehicles that have such bright lights? We need laws to keep people from using these flood lights on the road, keep them for off-road all terrain use, as intended. Our APPOINTED OFFICIALS need to pass legislation that will help to keep all drivers safe.

A.399 November 20, 2025 — Anytown, WA — Other

I received a free LED light bulb from my power company a number of years back. I installed it into a lamp to try it out. After one hour I had a headache. And I NEVER get headaches. Removed the LED light bulb, reinstalled an incandescent light bulb, end of problem. Years later and I have not yet again had one single headache due to my lights. I refuse to put LED bulbs into my house.

A.400 November 20, 2025 — Danville, IL — Astigmatism

These LED headlights are blinding, I already see halos from lasix and astigmatism so these headlights make it very difficult for me to see at night. From the front and behind me reflecting in my side mirrors it is very dangerous. I have to limit my driving at night because of it. They need to be banned!!!

A.401 November 20, 2025 — Janesville, WI — Migraine

Simply driving to a friend′s house in the evening caused me a migraine. This is very unsafe on the road, and it ruined my evening.

A.402 November 20, 2025 — Lugoff, SC — Migraine

On country roads at nights, the blinding effect of SUVs, crossovers, and trucks is exceptionally terrifying. I have to squint and try to avert my eyes to the white line right above my car′s hood to be able to continue to see the road any time another driver with ultra bright LED lights comes my way. I also have to position myself extremely uncomfortably when there is a vehicle behind me with ultra bright lights just to prevent the lights from coming in through my side mirrors. When I was a new driver, this situation only happened infrequently when driving in front of an oblivious driver that left their brights on. I physically hurt from cramping up my body and squinting my eyes on my commute home from work. I get migraines. I live in the country providing healthcare to patients that live in a healthcare desert. Vehicles like fuel efficient cars will probably become less popular as more and more drivers are tired of having their eyes in pain due to ultra bright lights at night.

A.403 November 21, 2025 — Norwalk, CT — Photophobia

Photophobia

A.404 November 22, 2025 — Lake Monroe, FL — Other

Bright LED spot lights at apartment complex are aimed at the street and my property. It is blinding to drive on the street and blinding to go through my own yard. I fell twice due to tripping because of the blinding lights ruining my night vision. The lights are even bright in daylight. The lights are still bright with a shade 5 welding lens. The light from these spotlights is harsh, and disorenting. This is dangerous for drivers and walkers and prevents me from being able to use my backyard at night. I can′t leave my dog out because the extreme light causes shadows that frighten the dog and causes all night barking.

In other areas I have noticed some of these road LEDs on the road are UV or purple. It is blinding at night and terrifying to drive because you are blinded by these lights, as well as the over-bright headlights from cars and it is awful to drive at night--even if you have good night vision--because these lights are making it impossible to see. This needs to be regulated. Go back to amber street lights--or at least soft white and cut down the blue and UV. There is no reason they cannot be made in a decent color spectrum.

A.405 November 23, 2025 — Chicago, IL — None

LED headlights are blinding at night. Been off road 6x and in 2 accidents .

A.406 November 23, 2025 — Toledo, OH — Migraine

I no longer drive at night, I cannot see. I have near constant migraines IN MY OWN HOME because you made incandescent bulbs impossible to get. I cannot walk through stores or work because the lights hurt so bad.

A.407 November 24, 2025 — Desert Hot Springs, CA — Astigmatism

I am a 23-year-old resident of the Coachella Valley, and I would like to bring attention to a growing road-safety issue affecting drivers in my area. Over the past year, there has been a noticeable increase

in vehicles equipped with extremely bright LED headlights, including trucks and off-road vehicles. These lights, combined with the fact that many local roads lack adequate street lighting, have created increasingly dangerous driving conditions.

Recently, I have experienced several incidents where the brightness of oncoming LED headlights made it difficult to determine whether drivers were using their high beams. Even while stopped at traffic lights or stop signs, the glare is intense enough to temporarily impair my vision. On one occasion, I nearly struck a pedestrian wearing dark clothing because an oncoming vehicle's LED headlights overwhelmed my field of vision. This was especially alarming given that the Coachella Valley does not have the level of street-light coverage found in larger cities like Los Angeles or Palm Springs.

The situation has escalated to the point that I sometimes need to pull over to recover my eyesight after being exposed to the glare from vehicles behind me. These repeated exposures seem to be worsening my existing vision issues, including astigmatism, and I now struggle to see my phone unless it is extremely close to my face.

I am requesting attention and assistance regarding this matter. The combination of ultra-bright LED headlights, insufficient street lighting, and inconsistent driving practices is creating unsafe conditions for both drivers and pedestrians. Improved regulations, headlight-aim enforcement, or expanded roadway lighting may help reduce the risk of accidents and long-term eye strain for community members.

Thank you for taking the time to consider this issue. I hope steps can be taken to improve visibility and safety for everyone in our community. In further information feel free to contact me.

A.408 November 25, 2025 — Chicago, IL — Other

Well it′s come to violence now. Today I got blinded and shined my light and she followed me and blocked me in my parking and sat there with BRIGHTS on ...started videorecording and I told her to STOP. She refused and I moved to another space away from her she then followed me and continued to shine a light at me with another SUV blocking me in. I called Police and they did NOTHING for this extreme harassment all on video. Security tried to help. The lights were so massively BRIGHT I still see spots right now and have pain and this was over an hour ago.

A.409 November 25, 2025 — Stout, OH — Other

When kept indoors, reptiles require full spectrum incandescent light for their metabolism. Without it the animals get sick and die. Incandescent and halogen heat lamps are also required for keeping reptiles. Oftentimes these heat lamps are just normal everyday bulbs with enough wattage to produce the desired amount of heat. Because of their use in the pet industry, these bulbs will remain readily available to the public at major retailers and pet stores. I purchase these lightbulbs for personal use in the home and office.

LED lights make me physcially ill. I can always see the flicker, and the light is refracted in so many directions that it is impossible to focus. I have 20/15 vision and especially good night vision. I avoid driving at night now if at all possible (does not work in the winter when the hours of daylight are pushed to the morning). LED headlights are blinding, especially the flashing lights of patrol cars and emergency vehicles. Use of LED lighting in vehicles is especially ludicrous because the power comes from the alternator which is running with the car no matter what, so no energy is saved.

LED lights are horrible for the environment with a huge negative impact. LED lights requiring rare earth minerals and microchips. The cost without taxpayer subsidies would be outrageous because LED lights are 25 times more expensive to produce. All the factories are overseas, so American taxpayers are paying for the foreign manufacturing of products which harm Americans. There is no shortage of tungsten, glass, or the metals used to produce incandescent bulbs. The environmental destruction, personal harm, and increased risk of injury or death associated with LED lights far outweighs any energy savings that could be claimed. The energy consumed in production of LED bulbs is many times more than the energy saved on the grid.

I used to love Christmas light displays this time of year. Now, because of the prevalence of LED lights, I cannot even look at them. It is criminal that these dangerous products are allowed on the market. The fact that government regulations promote them is an atrocity.

A.410 November 27, 2025 — Centerville, OH — Other

I am increasingly noticing that not only do LED/HID/XENON headlights and light bars ruin street and highway driving for everyone, they also shine into restaurant windows from parking lots and ruin dining. They also shine into house windows and blind neighborhood walkers. These overly bright lights cause stress and ruin quality of life. There seems to be no refuge anywhere.

A.411 December 2, 2025 — Chicago, IL — Other

Physical eye pain and multiply this times every single day today I was parking and because I was sitting still two cars blasted me with unbelievable bright light brighter than the average horrible LED I think the lights are getting brighter and I rather extremely dangerous level for vision it felt so strong I had to sit down and close my eyes for at least 5 minutes and they were hurting this city is not doing a goddamn thing people are sick assholes who don't give a s*** about no one but themselves and they're too stupid to even realize or care they got people real done with their phones and then they decided to do this demonic thing which lines babies who cares and people are getting killed who cares money is more important than life and vision

A.412 December 3, 2025 — Chicago, IL — Other

My health issue would be insanity knowing I have to deal with this every single day has changed me it's causing mental health problems and nobody's doing a damn thing even the drivers they could cover these lights such a simple simple thing to do it would take less than 1 minute to cover them or shut them off and why they think they need a man of the daytime it shows beyond me the average person is really ignorant and stupid when I drive in Chicago maybe one out of 50 cars we'll have their lights off in the day that's how bad it's got and not only that they're super bright they're even brighter than they were I'm living around a bunch of idiots and ignorant people who doesn't give a damn about the other guy

A.413 December 3, 2025 — Davis, CA — Autism

I was driving by a shopping center when I was struck in the eyes by a strobing blue LED light from an LVT mobile surveillance system. This caused me to shout out in my car because of the shock and eye pain.

A.414 December 3, 2025 — Pleasant Hill, OR — None

Too bright hurts

A.415 December 3, 2025 — Yolo County, CA — Autism

I was driving west on a county road when I came across road construction where the vehicles were using multiple intense amber LED flashing lights at about 1 mile away. By the time I got to about 0.5 miles away, the intensity and digital flashing were already overwhelming me and I determined that there was no way for me to get through these illegal amber LED flashing lights, so I made a U-turn and drove an alternative route which increased my drive time.

A.416 December 8, 2025 — Middle Village, NY — None

It is impossible to see with LED lights in rearview and opposite traffic lanes. I had a close call trying to change lanes as I could not see!

A.417 December 9, 2025 — Chicago, IL — Other

Oh my God had to drive at night again unfortunately got blasted solar blasted several times on the way home it was a 2 mi ride physical pain in my vision they ain't doing a goddamn thing about this s*** it's going to come to up to us to do it I support fully any action done against these damn headlights

A.418 December 9, 2025 — Redmond, OR — Migraine

I'm writing this incident submission to share the debilitating effects that the blinding lights have on my life. It is impossible to drive at night or on inclement weather days due to the blinding lights. The lights not only cause more accidents due to being blinded but also trigger migraines with loss of

vision and excruciating pain resulting in loss of work. These lights on 80% of the cars is a living nightmare for so many people. They need to be banned on cars!!

A.419 December 10, 2025 — San Diego, CA — None

I've been concerned about these bright LED headlights ever since they became the new standard a few years back. There have been many times where I pass a car coming from the opposite direction, and I legitimately can't see the road anymore. I just sort of keep going on my trajectory and hope I don't hit something, until the car has passed and I can see again. Sometimes I slow down to try and mitigate risk. By the way, I'm 28 years old with 20/20 vision, and this was never an issue before these LED lights became popular.

There's also, of course, the issue of cars behind you with bright headlights. Even if I set my rearview mirror to its "tinted" mode, the light coming off of my side mirrors is still so bright. It makes it almost impossible to see out of my mirrors, such that I can't see what's behind me or next to me, and it even affects my ability to see right in front of me. Not to mention, it's distracting and frustrating, which makes it harder to focus on driving safely.

Given how bright these LED lights are, it's no surprise that the high beams are even more blindingly bright. And to make matters worse, many of these new cars have high beams that automatically turn on and off. Oftentimes when I'm driving in a poorly-lit area (mountains, farmland, etc.), oncoming traffic will shine their brights right at me, making it impossible to see. Even if I flash my brights back to indicate that their brights are on, they have no way to manually turn them off. It's such a danger, and there have been multiple instances where I've gotten very scared and even started to panic a because I thought I was going to crash. When you can't see, all you can really do is cross your fingers and hope you don't die.

A.420 December 12, 2025 — Cheboygan, MI — Astigmatism

For the last year now I have had to quit driving while it is dark out because of being blinded by oncoming vehicles with intense LED headlights. I can no longer go to work in the morning and have to wait until it is light out and have to leave work early to avoid driving home in the dark.

I am losing significant income and I am no longer able to go to functions such as my Marine Corps League meetings, church functions, family dinners and other social functions and this is having a significant impact on my social life, I feel as if I am in prison and all alone without the ability to be around, talk, i and interact with others.

This not only impacts me but impacts the community who I help by being a member of the Marine Corps League, with programs such as Toys for Tots, Honor flights, donations to veterans and families in need of our assistance, and other community needs. It is absurd auto manufactures were allowed to implement blinding LED headlights with apparently zero oversight from NTHSA and they continue to endanger lives, take lives, cause accidents, drive up insurance costs, and a myriad of other issues with all new vehicles having these lights installed.

A.421 December 13, 2025 — Detroit, MI — None

The headlights on these newer cars is awful. There has to be some sort of regulation on them… It’s terrible

A.422 December 14, 2025 — Pensacola, FL — Astigmatism

Every single night whenever I drive home, about 40% of cars on the road have LED lights that cause me to struggle seeing the road. I have been blinded going home at night after work over hills on scenic, it's so bad that I have spots in my eyes after they drive by. Ive had to slow down on MULTIPLE occasions because the lights are so brights I feel like I'm driving into the sun and I can barely see the road. I had to pull over one night because they were so bright they gave me a headache. These lights should be illegal and mandated because its selfish and dangerous. I'm afraid I'm going to drive into a ditch because I can't SEE. Please, we need these lights to be illegal.

A.423 December 16, 2025 — Elk Grove, CA — Autism

I was a passenger in a car about 50 feet behind a motorcycle cop. The cop suddenly changed lanes and turned on an intense blue LED light that filled my field of view, causing me to shriek and then I began sobbing uncontrollably.

A.424 December 18, 2025 — Chicago, IL — Migraine

Today I was driving and sometimes I'll shine a light at drivers that blind me and they do blind us but I accidentally caught a cop with my light and he pulls me over tells me take out the little piece I have in my window that blocks these lights from blinding me and I tried to explain the lights blind me they're very bright and he acted like he didn't know what I was talking about actually he had his lights on that's why I shine my light and he wanted a ticket me and he told me I shouldn't drive anymore now they telling us our own public safety supposedly he's telling us not to drive now we're wrong and that the lights are fine basically that's the message we're getting from the police and whoever else so my report is my eyes hurt right now from all the bright lights I saw including his and that if you try to conform your car to make it better for you to drive and not see these lights the police are going to take the driver side that's blinding you that's the way it is now at least in Chicago it's pretty bad here

A.425 December 20, 2025 — Buffalo, NY — Migraine

I have had horrible migraines growing up. I am also autistic. Bright lights have always been a major trigger for my migraines, especially paired with stress or eye strain. The ever increasing brightness of LED headlights is getting absurd. I've had to get special tinted glasses for daily use due to my increased light sensitivity that has only gotten progressively worse in the past three years.

A.426 December 21, 2025 — Woodland, CA — Autism

I was at a restaurant and encountered a half-naked man passed out in the bathroom. I notified the manager who called emergency services. Before I could leave, the police, ambulance, and fire truck arrived with sirens and dozens of strobing LED lights. The lights and the strobing were so intense that I forced myself into a corner with my eyes closed. Yet, the energy level was so high that I could feel the lights pulsing, even with my eyes closed. I was forced to either endure the LED flashing light assault, or flee the restaurant. I chose to flee to my car, with my head down and my arms up, running through the gauntlet of strobing LED lights. I am still traumatized hours later.

A.427 December 23, 2025 — Anytown, NA — Astigmatism

these lights are blinding me, very difficult to drive down a rural road when snowing and white xmas lites lite along the property lines. blinding and distracting.

A.428 December 23, 2025 — Anytown, PA — Other

I have Seasonal Affective Disorder. They changed my light therapy to LED, it sucks and doesn't even come close to a therapeutic effect. Here in Pennsylvania we have mostly overcast skies from October to April. No fun with S.A.D. and LED lights. Change these lights please.

A.430 December 23, 2025 — Missoula, MT — None

The New LED Headlights are extremely blinding. It can make night travel dangerous. My shift ends at night and I drive back to my house with cars that are blinding me with their LED headlights. The street lights that are upgraded with LED are blinding. I believe it impacts my health in a negative manner.

A.431 December 23, 2025 — Prospect, KY — Autism

I can not tolerate LED lights in my home. I am highly sensitive, neurodivergent/ASD. I will use candles before I put an LED bulb in my home. I can’t believe the lengths I must go to to find incandescent bulbs for my home. Mostly I use the Amber incandescent bulbs because they were still being produced. I also use machine bulbs. I suffer LEDs in restaurants and other peoples home although I have found over the years I don’t like to leave home anymore. I don’t visit my family out of

state unless I absolutely have to and I just leave home less and less. I never associated that with the ubiquitous LED lighting but it could be a factor. I don't feel like I live in America, home of the free, any longer when we are being ruled by a global tyrannical federation. I am glad half my life is over although I love life immensely. I can't bare what this country has become with its lean toward brutalist, institutional, communistic aesthetic. It's devastating to my soul. I am so sensitive to my surroundings and I guess I am a rare breed because I am frustratingly one of the few that speak up about it. Freedom, beauty, truth and the golden rule are the lost cornerstones of our America. The house is crumbling on YOUR WATCH. Be better. This world is nothing but your soul is eternal. Use this world to hone your soul. Start today. God bless.

I have a difficult time sleeping from all of the LED lights. I get very agitated and irritated since they came out. I really dislike how the blue street lights make me feel.

A.434 December 24, 2025 — Easton, PA — Astigmatism

LED street light shines directly in my bedroom with dirty energy

A.435 December 24, 2025 — Orange Park, FL — Photophobia

From my very first exposure to blue led car lights - it feels like my eyes are being stabbed. Very painful. It's been years now and I am constantly trying to avert the lights in oncoming traffic @ night. I've also been parked and a car with these lights pulls up in the parking space in front of me and the stabbing feeling is immediate. I didn't realize til I heard this on a podcast that it wasn't just happening to me.

A.436 December 24, 2025 — Rockford, IL — Astigmatism

I was making a left turn and I was blinded to the point by some new pick up truck that I couldn't see the highway divider curb thing so I hit a curb the day after I got my alignment done on my car,

Other times they are so bright and on these big trucks pointing directly into my eyes wasn't able to see the lines on the road for a split second before the truck would pass me

A.437 December 24, 2025 — St. Paul, MN — Other

I have hyper sensitivity to light due to small fiber nerve damage in my brain. This nerve damage was caused by a toxic reaction to taking a fluoroquinolone drug in response to a sinus infection 9 yrs ago. LED lights are exceptionally difficult to look at since then. I am able to use filters on my iPhone and computer devices...but I cannot filter out the LED headlight glare that is becoming more and more pronounced at night. More cars are using them, and car companies are often intensifying the brightness in newer vehicles. As a solution, I have had to significantly cut back on night time driving as a result. LED light glare has dramatically altered my life. It has limited my social life and inhibited my ability to assist elderly parents and family members during evening hours. It's a handicap and debilitating.

A.438 December 24, 2025 — Surrey, BC — Other

My personal experience is negative with these lights; anxiety and agitation and eye strain , particularly when I'm in a place where there are a lot of them, so shopping in big stores or malls is out of the question. Driving at night is dangerous due to the blinding effect on oncoming Led headlights, particularly those on new cars and trucks. If I do ever need to drive in the dark, I use high beams when being approached by LED headlights, necessary just to vaguely gage where I am on the road. This is very stressful but I don't know what to do about it. I've tried anti glare glasses and they're useless against these very powerful headlights. I have a LED flashlight and that's about all I can stand to have around me. Please take this issue seriously, it's impacting our brains and eyes. Many others I've spoken to are experiencing the same issue. Unceasing blessings to you all this Christmas and in 2026, Barbara

A.439 December 24, 2025 — Toronto, ON — Other

One vital thing that is very relevant is the problem of Age related Macular Degeneration of (AMD) the eyes. The focal centre at the back of the eye, which is most closely packed with cones to maximize definition, begins to get damaged by the higher energy blue end of the spectrum. In areas around the centre are less cones (which give you colour) along with rods which are sensitive only to the light regardless of colour. So the areas (side vision) are lower resolution to start with, which is why any distraction requires your eye to swing around to get a clear picture. As the focal point begins to die away, one experiences dark floaters in the eye and later permanent black spots, ultimately you go blind. Birds and many insects have eyes that can see the blue-ultraviolet light, which eventually destroys their vision, but they have very short lives compared to us so it doesn't matter. There should be a research study started on the rate of AMD compared to the the use of LEDs in the environment of the victim. I am one of those victims.

A.440 December 25, 2025 — Motueka, New Zealand — None

1. Night time Driving - These led lights from on-coming vehicles have on several occasions almost caused my husband and myself to go off the road from their blinding effect, especially when they hit our eyes when driving around a corner, we are unable to see where we are going. Led car lights a terrible, terrible thing to have on vehicless for night driving. 2. Also, we have these lights in our shop because they donot come in any other form. They drain our energy and thinking ability. They are hazardous and should be remodelled to have all the spectrums of light, not just the blue light. We deal with sick people every day. These led lights are not conducive for our health nor the health of our customers & staff member, whom is light sensitive and has had to use special red lenses over her glasses to function properly at work. I have seen an improvement her use of the red glass attachments over her glasses...Please change the law for the sake of Human and Road safety.

A.441 December 25, 2025 — Oil City, PA — Migraine

A couple of year's ago, incandescent lightbulbs were banned in PA and the state sent out a box of light bulbs to every resident. I went through my house and replaced all of my lightbulbs with their LED lightbulbs. I liked them because they seemed to last longer and I felt possibly make my electric bill cheaper. But, after over a year of using them, I started noticing terrible migraine headaches, especially in the early morning hours when I was trying to do some reading. I also then started noticing a decline in my vision, which was odd because I had received a clean bill of health from my eye doctor in Colorado and a report of 20/20 vision. I found it increasingly difficult to drive at night due to the blaring headlights, and had basically stopped driving after dark altogether. But now, I was having a strange issue with my eyes. A sudden blurring sensation that would stop when I left the room of the LED or when I closed my eyes. Then, one morning, I felt my eye suddenly drifting and my vision instantly blurred. It was like my eye had just lost all muscle strength and drifted from its position! I grabbed and cupped my eye with my hand and ran to the bathroom to figure out what was going on! Once I got there, it seemed to return to normal. But, I began to wonder if it was the LED lightbulbs. I consulted a physician who was a friend about the situation. He assured me that he had not seen any research that LEDs were dangerous for eyesight. But, I didn't believe him. I instinctively took out all of the LED lightbulbs from my house. I found only one incandescent lightbulb left and put that into my lamp. I thought I'd be better off with no light at all. Then, I began weeks of self therapy staring at candles at night and giving my eyes the rest they were needing from all LED bulbs. My eyesight returned to normal. Eventually, friends and neighbors supplied me with incandescent lightbulbs thinking that I was just their weird hippy friend that they were trying to accommodate. I haven't had any trouble with my eye sight since the switch back to incandescent. My friend, however... the doctor? Well, he since received news that he's going blind. He's had to cease his practice of medicine altogether. I told him to get rid of the LEDs but he won't listen. He, unfortunately, is one of these people that trusts everything the medical industry and government tells him and he's paying for it with his eyesight. Terrible! They should all be ashamed of themselves!

A.442 December 25, 2025 — Truxton, NY — Electromagnetic Sensitivity

I have gotten headaches from florescent lights since first grade 60 years ago. I was finally given the correct diagnosis for my condition this year: Post Trauma Vision Syndrome. I tested as having both brain injury and Lyme disease contributing to my condition. Most of my adult life I was able to manage my condition by controlling the lighting in my environment. I have primarily been self-

employed because of my need to control the lighting in my work environment. Then, a couple years ago, the only type of light bulb I could tolerate, incandecent, became outlawed. I bought I large supply when I learned this was about to happen, but now I cannot visit the homes of most of my friends and relatives without becoming ill. I could not tolerate the lighting at the local fire hall where we held funeral dinners for each of my parents. I cannot stay in stores very long due to the lighting. Medical facility lighting makes me ill. I am now more severely disabled by my condition because the wider world does not make space for the needs of people like me any longer. When school buses or emergency vehicles with strobe lighting pass by my vehicle I have to look away to not become overwhelmed by that most obnoxious form of light, I should be paying great attention to those vehicles, but that would be dangerous for all involved. Looking away is the best I can do. If I am in a building when strobe lighting is used I will close and cover my eyes, but I can't do that when driving. I work with children with neuro-developmental injuries, This is an issue for them as well and they have to sit in classrooms whose lighting does not meet their needs, just like I had to back in elementary school.

A.443 December 26, 2025 — Chicago, IL — Electromagnetic Sensitivity

Unfortunately I had to go out today for the holiday and coming back in the dark was I don't even know what words to use how horrendous it was with these bright f****** lights the situation has not changed and it's not ending I was in complete mental distress nobody cares enough to even cover these damn lights it's like riding through a celestial bomb where a whole bunch of them go off all at once it feels like a brick is thrown in my face over and over again this is reality now this is the nightmare we live every single day it's actually real and sick

A.444 December 26, 2025 — Lake Placid, FL — Astigmatism

Astigmatism is only one of the issues with LED lights, but that is excruciating to be blinded by vehicle lights as well as the street lights, business lights, and home porch lights. This light is also killing the trees that are bombarded with the lights (I am a scientist…the artificial lights are damaging trees, wildlife, insects (in addition to all the other detrimental things affecting them (herbicides, pesticides, etc.)).

A.445 December 26, 2025 — Louisburg, NC — None

I literally cannot drive at night anymore. I'm on back roads in rural NC and these are running me off the road because they are so blinding. Just because car manufacturers can make them this bright, doesn't mean they should.

A.446 December 27, 2025 — Chicago, IL — Photophobia

Photosensitive epilepsy, bright LED lights on the street lights, head lights , Lincoln Park zoo lights, Costco, Whole Foods, blinding, making me have to wear Ray-Bans sunglasses at night. It's painful to have to look at a phone, I can't watch TV, can't go to movies, if I'm in a store that has LED lights and I feel like I have to puke. I

A.447 December 27, 2025 — Sanford, ME — Migraine

LEDs give me a headache. I've had to quit driving at night for fear of an accident. Those darn lights are glaring, blinding and unnecessary! They should be against the law.

A.448 December 28, 2025 — Hollis, ME — Astigmatism

For me, encountering high-intensity LED headlights is not a minor nuisance; it is a physical assault. The sensation is immediate and visceral—like a dagger stabbing through my eyes and directly into my brain. This pain triggers an involuntary fight or flight response, forcing me to look away or squint just to cope. The effect is cumulative; each passing car compounds the pain, rapidly triggering a headache that makes my eyes even more sensitive to the next beam.

This physiological reaction creates a critical safety failure. Because I am blinded by the glare, I lose the ability to scan the woods for deer or even track the lane lines in front of me. I have found myself slamming on my brakes in the middle of the road because I simply cannot see where I am going, terrified I might drift into oncoming traffic or get rear-ended. The reality of this danger hit home recently when I nearly struck a pedestrian. I was so overwhelmed by the wall of oncoming light that I

was completely blind to a person crossing the street until I heard a horn and saw them in my rearview mirror. These lights are erasing the world around me and endangering lives.

A.449 December 28, 2025 — Rigby, ID — Epilepsy

Bright lights with new vehicles prohibits my ability to even use my mirrors at night, they are useless. This takes away situational awareness and makes the roads extremely dangerous. I can not believe that these lights are legal to begin with.

Health wise these have triggered a seizure with a passenger of mine a few years ago. They didn't know that they had epilepsy until this moment. These lights are completely unnecessary and cause extreme danger on the road.

LED headlights have made night driving for me an absolutely unbearable experience. I always just assumed my eyesight was getting worse, but then after driving at night while visiting Guatemala, I realized - this is a unique issue to the USA. My eyesight has not changed, the cars here have. Driving at night is straining, exhausting, and stressful beyond words, like it never was before 2016 or so. Please understand that this is such a common experience and issue, and so frustrating to so many millions of people, that the easiest way for the government to do something that makes people like whoever is in charge is to ban these dangerous, stupid lights. I will probably soften my view on the entire Trump administration if it acted on literally this issue alone.

A.454 January 3, 2026 — O'Brien, OR — Other

Everyday I am exposed multiple times to headlights clearly above the legal lumen limit. Even in daytime I am forced to look at the passenger side shoulder many times. Besides being a danger and a supreme aggravation, it is likely illegal and NOBODY is doing anything about this. I was considering pointing a 6328 laser above their eyes but found out I could get in serious legal trouble for that. But not them, free to endanger my vision and my life every damn day.

Ocular Migranes

A.462 January 7, 2026 — Manhattan, KS — Other

It’s really hard to drive safely during the evening hours in a small car with halogen headlights and my eyesight is being compromised whenever newer vehicles are within 50 feet of my line of sight or my mirrors. And where I live, everyone is in much larger vehicles so there’s no reprieve. And more often than not, the brights are on and that makes it even more difficult. This needs to change and soon

A.463 January 8, 2026 — Centennial, CO — None

I have perfect vision, and every time a vehicle with LED headlights comes towards me, I am blinded, with a dramatic loss of night adapted vision. This is a huge safety hazard, as the dazzling light obscures the presence of hazards or pedestrians that are unfortunate enough to be caught behind it.

A.464 January 8, 2026 — Chicago, IL — Photophobia

OMG it's now 2026 and STILL NO CHANGE. Today driving almost every DAM car hit me in the face like a brick with their dam bright solar flares and it caused immense stress and PAIN in my eyes !!!! Why are our lawmakers acting like they can do NOTHING!!!! They don't need to "research" or investigate. Walk outside and just look down the road dammit!!! Day in and out we put up with something forced on us and can't go out anymore!!!! WTF????

A.465 January 8, 2026 — Durham, NC — Astigmatism

Several years ago I decided to stop driving at night entirely, because the glare from the oncoming LED headlights made it impossible for me to see well enough to be a safe driver. So now, during the winter months, I have a very reduced social life. No Holiday parties or dinners out, unless I can ride with someone else. I'm 70 and retired, but if these LED headlights had been a factor when I was working, I don't know how I would have managed if I had a night job. Now I know that most of the women my age, and some of the men, also cannot drive at night anymore. If any of my friends need help at night, I cannot get there to help them. I'm also sure that they damage my vision because after being exposed to them I cannot see clearly for a while. Also, I have read much about how they are very bad for our eyes. Please, please can't we ban them for the health and safety of every one of us?

A.466 January 8, 2026 — Fort Worth, TX — Astigmatism

Disrupted and impaired night vision and additional sensitivities, with all types of emergency vehicles flashing their 'caution' lights. They should all be banned from use, as they have been weaponized against the general population.

Over time these cause degenerative health effects and should be classified as high-frequency weapons.

Simpler, lower intensity, health-frequency tuned soft lights are still visible at night as well as daytime with their flashing and motion across lightbars.

Reform NOW!

A.467 January 8, 2026 — Frederick, CO — Migraine

On the day of the incident I had a line of cars with bright , LED headlights driving towards me. I looked to the right as they passed to limit the effect of the brightness but the last vehicle was a pickup. As it went over a bump I received the full brightness of the its LED headlights and couldnt see for a second despite looking to the right already. The brightness and color temperature of the LED bulbs make it difficult to see at times. The cool color temperature of the bulbs then spoils my night vision after the car passes and takes a few seconds to recover. I find myself closing one eye as a vehicle with LEDs headlights, or LED bar lights, passes so I can still see afterwards at night.

A.468 January 8, 2026 — Littleton, CO — Astigmatism

Yesterday I was on my local road at night with an F150 behind me. I could tell by the headlight pattern. The issue was the brightness leading to blinding intense LED light that overtook my visual field as the driver ahead of the F150. I felt unsafe due to the glare even moving my eyes off angle. I pulled over to let him pass as I couldn't drive safely with him behind me.

A.469 January 8, 2026 — Midwest City, OK — None

I avoid driving at night if possible because of the blinding effects of oncoming traffic. While oncoming traffic passes me, I have no choice but to go straight and hope nothing is in front of me. This never used to be the case. Large and tall vehicles like trucks are especially egregious. If behind me, they illuminate the interior of my car (VW Golf) as well as the interior lights. We need new regulations limiting GLARE, not just total light output. The glare from LEDs is far higher than traditional lighting sources. There are several methods/equations for measuring/calculating glare. Pick one, and use it.

A.470 January 8, 2026 — Rye, NH — Astigmatism

In rainy New England the increase in glare from bright lights on cars and billboards is making it very dangerous to drive at night. Some of the new cars and aftermarket bulbs are brighter and more blinding on low beams than high beams used to be. When it is raining or snowing, the problem is compounded and the risk factor is many times higher than it used to be. In winter when there are snow banks or ice sometimes pedestrians need to walk on the side of the road. At night you can't even see them until the last second due to the glare of oncoming headlights.

A.471 January 9, 2026 — Glen Burnie, MD — Astigmatism

Navigating the road at night with astigmatism feels less like driving and more like navigating a chaotic light show. Every oncoming pair of modern LED headlights doesn't just glow... it explodes into a blinding "starburst" of jagged white lines that stretch across my entire field of vision. These new bulbs are piercingly bright, and because my eyes can't focus the light correctly, each one creates a massive glare that washes out the lane markers and hides the car behind it. It's a constant cycle of squinting against the sharp, blue-white needles of light and waiting for my vision to recover, only to be hit by the next ultra-bright sensor-activated high beam.

A.472 January 9, 2026 — Sedona, AZ — Other

LED lights are extremely detrimental to my health - and not just the health of my eyes but my mental and neurological health as well. They are insidious and ubiquitous, and this is what makes them so dangerous. They assault those of us who are vulnerable to them in overhead lighting and light bulbs, screens of every variety, decorative twinkle lights, and car headlights, just to name a few.

Exposure to LED lights causes me intensely painful headaches, severe eye pain and blurred vision, ocular migraines/migraines with aura, and worst of all, complete mental shutdown. My brain literally stops working, and I feel like a zombie the rest of day or longer. Screens become too painful to look at, and I can't think or function. There is nothing I can do to mitigate these effects other than rest and abstain from further LED-induced damage.

As more and more stores and public spaces switch to LED lights there are fewer and fewer places I can go. My local library recently installed LED lights and I can no longer stand to be there for more than ten to fifteen minutes before the debilitating effects take hold. When I job hunt I have to physically check the lighting before even applying, as I cannot work anywhere with LEDs. Needless to say, this severely limits my options in an already poor job market. If the proliferation of LED lights remain unchecked I fear I will end up a virtual shut-in.

I recently purchased a new iPad, released mid 2025, and to my dismay discovered I could not bear to look at it, as the screen was LED and caused immense eye pain, blurred vision, and headaches. I had to return it. My older 2015 iPad, with its LCD display, has never once caused me such problems. Technology is inescapable these days, but what are we supposed to do when the only option, LEDs, is unbearable? I will continue to use my old, safer technology as long as I am able, but I honestly don't know what I will do when it no longer works. LED screens severely impact my quality of life and my ability to function in society.

I have astigmatism, and while my night vision has never been great I can no longer drive at night due to LED headlights blinding me and destroying what little vision I had. I just don't feel safe, and don't want to risk my life or the lives of anyone else on the road.

Trying to locate incandescent and halogen light bulbs is ridiculously difficult and increasingly expensive, but I have no other choice. I ration their usage to preserve the life of the bulbs. And despite their small size LED twinkle lights are especially painful - looking at them feels like being stabbed in the eye. And the headache they cause lingers for hours afterward.

It's obvious the human cost has no bearing on corporate and governmental policies compared to monetary profits, but I beg anyone reading this to please, please put a stop LED lighting before it can continue to destroy the health of people who've done nothing but be born with sensitive eyes, brains, and nervous systems.

A.473 January 10, 2026 — Oklahoma City, OK — None

Everyday I walk and ride bikes in my neighborhood and the local area, and everyday there are headlights so bright that I can't see anything around me. I have almost ridden into parked cars, tripped on the curb, and narrowly missed avoiding other vehicles because LED headlights are so bright that nothing else is visible.

A.474 January 10, 2026 — Siloam Springs, AR — Other

LED's are slowly making me blind.

A.475 January 11, 2026 — Gettysburg, PA — Photophobia

Horrid, life threatening. Can no longer drive at night. Aggressive tailgating drivers with much larger vehicles cast equally obscenely bright and painful lights into rearview mirrors. It is unbelievable that our elected officials would allow this! To my knowledge foreign countries have regulations but the USA does not. How could a young teen safely learn to drive?

A.476 January 13, 2026 — Cupertino, CA — None

Today, I went outside for a walk. I couldn't even look in the direction of my apartment parking lot because a car was parked with its headlights on. They were painfully bright, enough that even looking towards the car parked next to it was still painful. Green afterimages remained in my sight for minutes afterwards.

A.477 January 14, 2026 — Ketchikan, AK — Photophobia

The city surrounded my home with 4000 kelvins street lights in front and back of house . I immediately felt them when they came on. it was like a shock to the body!! Since 2021, everything from vision, CNS, hypertension, cognitive issues, immune system, fatigue, insomnia, PAIN!!!!! tremors and absent seizures. all documented by over 9 Doctors LED LIGHTS NEED TO BE BANNED They have ruined so many aspects of my life.

A.478 January 14, 2026 — Leonardtown, MD — None

I grew up having perfect vision. 20/20 all my life, never needed glasses of any kind. As soon as I learned how to drive, I loved driving at night. I never experienced any problems with glare from the halogen headlights except in cases when a driver's high beams were on at the wrong time, and the fix was simple: flash your brights and the other driver could correct their error.

But since the implementation of LED headlights that began when I was in my 20s, I have struggled to drive at night. The LEDs are blinding regardless of whether the beams are high or low, properly positioned and aimed or not, and there is no way for a driver to correct it. I've implemented the use of blue-blocking driving glasses, which barely take the edge off, and ultimately do not solve the problem. I find myself squinting and holding my hand up in front of me to block the glare of not only the headlights of oncoming traffic but also those flooding my side view and rear view mirrors.

Even still, my night vision is ruined and I can barely see my surroundings, if I can see them at all, over the blinding glare.

Now, in my 30s, with all new cars being fitted with LED headlights and these newer cars comprising more than half the cars on the road, I am no longer able to drive at night at all. Not in my 60s, not in my 50s, but in my 30s.

My vision remains otherwise excellent. As an avid hiker, I am fond of night hikes in the woods near my house, and I can see in their enveloping darkness with great clarity using no artificial light whatsoever to illuminate my path.

But the blinding glare from LED lights feels like a stab to my retinas. The high intensity, highly focused, blue-rich beams completely obliterate my night vision, not just for the duration of the acute glare but for many moments afterward. This renders driving at night completely unsafe. Even the intense brightness of some LED taillights is too much for me.

This limits not only my quality of life via my ability to participate in social activities after dark, it also limits my potential work opportunities, especially in the dark months of the winter. Even in the daylight on on rainy days, when everyone's headlights are on, the lights are blinding and impair drivers' ability to see, which exacerbates the dangers already present on wet roads.

I won't get much into the impacts of the growing prevalence of LED external light fixtures in residential areas, but these pose similar harms not only to drivers but to pedestrians as well. They disturb the sleep of people in their homes and imperil the local wildlife.

LED lighting poses a significant and totally unnecessary public safety hazard in the name of saving a few bucks a year on electricity. Many are totally disabled by it. These lights require a complete overhaul and ideally a total ban as a light source for anything except low-powered indicator lights.

Return to us our halogens, incandescents and sodium lamps that we may once again enjoy the safety and the warm, peaceful glow that once accompanied our nights.

A.479 January 14, 2026 — Visalia, CA — Other

Blue light at night should be banned - especially in public spaces. LED streetlights and billboards (and headlights) are so blindingly bright, I cannot go outside at night anymore.

A.483 January 21, 2026 — Orlando, FL — Autism

Headaches!!!!!! Inability to see. INCREASED danger to everyone else!! I hate this

A.484 January 23, 2026 — Syracuse, UT — Epilepsy

I'm forced to have led halogen and so forth lights in my home and Art Studio. I absolutely need incandescent lighting for my epilepsy. It is like living in the old days where I have to only do things with daylight coming in. I have to turn off lights constantly. If I need the lights on which is often I end up with seizure symptoms or blatant seizures. Which by the way kills off brain cells every time you have them. I am desperate for incandescent lighting again. It's bad enough I can't go out in public places for very long if my hormones are unbalanced if I've not eaten drank or slept in a perfect state. I would like my home to be a safe Zone and be able to have incandescent lighting which is not too much to ask. This is for medical purposes and I should not be denied this it is limited my life consistently and impacted it greatly

A.485 January 24, 2026 — Vista, CA — Electromagnetic Sensitivity

The brightness of LED headlights started giving me great discomfort the moment they were introduced on cars. Initially, there were only a few cars that had them so the effect on me was minimal. Now, 80% of cars have them and they are way too bright.

This year has been the worst it has ever been. My eyes literally hurt when confronted by LED headlights. I have heard that LED headlights damage the retinal pigment, the DNA in the eye which then causes premature macular degeneration. I can totally see how this could happen.

Making things worse is the fact that many cars have auto headlights and they are automatically turning the brights on in the city! This shocked me because I have driven cars for 40 years and probably only needed my brights 2% or less of the time I was driving. These auto headlights do not always turn off in the presence of other cars.

Another issue is LED headlights on during the day. That is right, they are on during the day and are way too bright. I can stand in direct sunlight and my eyes are fine, but when confronted with LED's, I experience immediate discomfort.

Buildings are now using them in parking lots as well and they are intolerably bright. Making matters even worse is that emergency service vehicles have these lights as well and they are ridiculously bright.

The brightness is so alarming on cars that I get temporarily blinded by their headlights. This creates a safety issue.

A.486 January 27, 2026 — National City, CA — Migraine

Brights and LED headlights have been triggering my horrific migraines while driving. It is terrifying. Not only are the migraines painful and debilitating and disorienting, but my vision becomes impaired when migraines are triggered. It's happened several times while I've been driving at night, and this is so dangerous. I don't understand why lawmakers haven't stepped in to stop this. LED lights are way too strong for use in cars. At the very least, there needs to be strong filters so that drivers, riders, and pedestrians are not being blinded by the brightness.

A.487 January 27, 2026 — Shippenville, PA — Migraine

While at home this evening I was working on my HP Spectre laptop which is plugged into a 2006 Gateway LCD monitor. The indicator light for the caps lock hit me about 20 times in a 30 minute span while I was trying to cover the light. It caused immediate pain and a migraine with auras. This also caused a cognitive decline and overwhelming feeling.

A.489 February 1, 2026 — Twentynine Palms, CA — Other

Pain and blinded for white L ED headlights

A.490 February 2, 2026 — Dallas, TX — Other

Over the last five years, I've noticed a dramatic and worsening increase in the brightness and glare of LED headlights on newer cars and trucks. Each new vehicle generation seems more intense than the last. The light is not just brighter, it's harsher, whiter, and more blinding, especially at night.

Driving after dark has become increasingly difficult and, at times, unsafe. On back roads or two-lane country roads, approaching vehicles with these LED headlights can completely overwhelm my vision, particularly when coming around curves. When large trucks follow closely behind, the reflected glare can be so intense that I've been forced to slow down or even pull over to safely let them pass. I have been driving for decades and never experienced anything like this prior to the widespread adoption of modern LED headlights. This issue has progressed rapidly in recent years and feels largely unregulated. In my experience, these lights now pose a genuine safety hazard and need clearer standards and enforcement.

A.491 February 5, 2026 — Bonney, WI — Electromagnetic Sensitivity

My bathroom light flickers and it makes my eyes hurt. Lights have bothered me for years and I have had trouble sleeping for years and taken medication but no help. I'm convinced that LED's are my problem but I'm having trouble getting replacements. I feel stuck.

A.492 February 6, 2026 — Vista, CA — Other

LED headlights are blindingly bright and cause accidents and indoor LED lights cause mood and depression like issues.

A.493 February 10, 2026 — Kershaw County, SC — Autism

The light is blinding bright. It shines in my home bothering my autistic daughter. It also spooks my livestock.

A.494 February 12, 2026 — Sebastopol, CA — None

LED lights flicker and make me have a hard time focusing and calming my nervous system. LED lights in cars make me feel unsafe to drive at night because they are so blinding.

A.495 February 13, 2026 — Honeygrove, TX — Electromagnetic Sensitivity

Early in the morning 615, I go to the local donut store and I turn on the corner and a company truck has its brights on, and it affected my eyesight and I'm hurting right now with my eyes. Liberty sanitation of Bonham Texas

I must be very sensitive to brightness of LEDs because they make me feel like my brain mentally can't deal with the light. I get very irritated, sad, and mad all at once. God made light and dark for a reason. We can't rest our brains because our brains can't shut down with this type of light. PLEASE HELP ALL OF US.. BLESS THIS WEBSITE!!

A.497 February 14, 2026 — Stanley, NC — Other

Me, my 6 y/o son, and 2 y/o daughter were hit by a car while walking in a crosswalk leaving their school Christmas program. The streetlights had recently been replaced by purple LEDs, reducing visibility. There are documented complaints filed with the municipality regarding these lights prior to this incident. The bright headlights from vehicles leaving the performance contributed significantly to the conditions that caused the driver to fail to see the crosswalk and us in it. The multitude of bright lights also caused us not to see him coming around the curve. My son suffered a traumatic brain injury, almost died, and was airlifted to Levine's Children's Hospital, where he spent 18 days recovering, learning to sit, eat, talk, and walk again. Grateful to God for his miraculous healing. It's time to do something about these lights. Children are dying. Pedestrians are getting hit every single day. This matters, and it's so fixable!

A.498 February 15, 2026 — Flourtown, PA — None

Every time I drive at night, I am blinded by oncoming car headlights! It seems that it has become a competition for auto manufacturers to have the brightest headlights. There seems to be no concern for oncoming drivers. I often find my eyes lids fluttering as I try to maintain my situational

awareness. It is TOO MUCH! I am sure accidents are happening nightly as a result of drivers being blinded.

A.499 February 17, 2026 — Asheville, NC — None

I make a morning commute at 6:00 every morning. The absurdly bright headlights of other cars make that commute a massive pain. I dread every car coming around every corner. I can't look away, I can't do anything other than brace myself and just accept that I won't be able to see for a couple seconds. It's very dangerous when I'm out on the highway or on roads I'm unfamiliar with, on top of being extremely uncomfortable. Make bright LED headlights with uncontrolled spread illegal!

A.500 February 18, 2026 — Nashville, TN — None

I would write down the plates but I can't even see the car apart from the fact that the lights are very strong being low they use them high in the city until I saw police with very blinding lights but most people have even higher lights wherever they are while some respect most don't do it and it really hurts the sight it's very annoying and dangerous while the police don't do anything they are just like npc until I have to put my hand so that it doesn't hurt my eyes even if I'm walking or cycling they hurt it's frustrating

A.501 February 28, 2026 — Davis, CA — Autism

I was struck in the eyes by white LED strobe lights by two recumbent bicycle headlights that caused to me to suffer pain and panic. The LED strobe lights must be permanently banned.

No night sky.

A.503 March 3, 2026 — Amherst, NY — Photophobia

Difficult driving at night, difficult walking the neighborhood where LED lights have been changed. I've also submitted for the village of Williamsville, which I reside, but Amherst is the town. And does provide services for the village.

A.504 March 3, 2026 — San Francisco, CA — None

Eye damaged by an insanely Bright LED on a Semi Truck while driving at night. It was a dark field with no illumination when suddenly the truck either crested a hill or turned on its lights while not on before. It was a life-altering injury. LED light should not be used for illumination. It is destroying our collective eyes and brains. We are all suffering because of it. Quality of life diminished greatly because of the forced mass adoption of this horrible "technology". Go back to Incandescence.

A.505 March 3, 2026 — Village of Williamsville, NY — Photophobia

My ability to be able to enjoy walking my neighborhood or being able not to put blackouts on my windows. If in when LED lights are installed on my part of the village parts of the village have already been converted. I suffer from depression and anxiety in adhd. Extremely a light sensitive.

A.506 March 4, 2026 — Chicago, IL — Other

I get out late and need to take lake shore drive home. Cars run up to about 80 miles an hour which makes these LEDS a blinding disaster for me in my little sedan. BAN LED LIGHTS. THEY ARE HARMFUL!!!!!

A.507 March 5, 2026 — Murrieta, CA — None

I drive an hour home from work every night. During my hour long commute I am bombarded by bright LED headlights of other cars, regardless if they are oncoming or behind me. One incident particularly stands out, where I was waiting in a turning lane and truck with the highest and brightest headlights pulls up behind me. I was blinded just looking through my side view mirror and I couldn't see forward because the lights were also in my rearview mirror. The lights were so bright they lit up the entire inside of my car. Everywhere I looked was like an intense strobe light shining directly into my eyes. By the time I got home I could feel the effects of the lights. I'm worried my vision is

becoming more damaged with each night I drive home. This isn't good. Please do something about this or people will go blind.

A.508 March 9, 2026 — Kingston, Jamaica — Other

driving through a 60 mile stretch of 2 lane road in NC the road was wet and the lights were so bright i could not see the road in front of me. when i got home i upgraded my headlights to brighter led's so i could see the road. extended distance lights encourages speeding

A.513 March 31, 2026 — Holland, NY — Other

The law for the intensity of allowed brightness is ambiguous. It simply states "brilliance". There should be a lumens value where we may measure how intense the headlights are. It would be easy to ticket offenders. The same thing can be for the law on automobile noise.

April 2026

A.514 April 1, 2026 — Japan — (no category given)

I am Japanes. I wrote an article in english about the damage caused by LEDs.In Japan,LEDs are about to be made mandatory, and nobody is going to help me. Please read it. I will send you my website adress. https://note.com/treeleaves/n/na23539ed16cc

A.515 April 3, 2026 — Brunswick, ME — Astigmatism

No specific incident. Vehicle headlight brightness has been an annoyance for the past few years. It is near impossible to drive at night these days, and even during the day to dodge the laser beams of current headlights. This is a huge safety issue, and most people are likely not even aware of the problem their vehicles are causing.

A.516 April 7, 2026 — Asheboro, NC — Migraine

Since late 2022, LED visible radiation has made my life a living hell. I suffer from migraine disease—a physiological condition that is as real as Type 1 diabetes or severe allergies. It is not "psychological," though I have been gaslit by neighbors (who are medical professionals) telling me exactly that. The chronic pain and environmental stress caused by these lights have been so severe that I have had to seek professional therapy to cope with the impact on my life and health.

In early 2023, my neighbor installed an unshielded LED floodlight as bright as a stadium spotlight. It shines directly into my property, illuminating it so brightly that I can no longer enjoy the night sky—one of the primary reasons I moved to these mountains. Once the sun sets, I am forced against my will to go inside and close specially designed blackout blinds. Because there is no lighting ordinance in Asheboro to protect disabled people like me, I am effectively a prisoner in my own home.

This is a systemic issue. I can no longer drive home from work on the highways without a debilitating headache because of the unfiltered, "whiter-than-white" LED lights recently installed on cellphone towers. I am never fully present anymore; I am constantly "scouting" my environment for triggers.

There are over 40 million Americans with light sensitivity. We are being assaulted by cheap, bare-bulbed LEDs that are poorly filtered. Mandating that government and infrastructure lighting be

yellow-spectrum, high-quality, and shielded would make the world accessible again. We exist, and we should be heard.

Note: I give my full permission for the Soft Lights Foundation or government agencies to contact me for further documentation, medical records, or evidence regarding these claims.

A.517 April 10, 2026 — Charlotte, NC — Electromagnetic Sensitivity

Blinded and head pain by headlight light directly in my face . Scared I was getting stroke like or seizure. I'm sure it did something g.

A.518 April 10, 2026 — Fairfield, PA — Other

I am in a historic, small rural town in PA. I have been fighting tirelessly for 6 months to insist on warm (2200K), fully shielded in order to light only public spaces and not private ones, taking in the nature of each area of the Borough's lighting need and only as bright as the need is, IES/ANSI/DarkSky approved LED lights for our small town, that has had a history of the Council letting the power company, MetEd do whatever they wish. Last Autumn, a 4000K unshielded LED 2 laser beams of a light was suddenly installed across from our home. We and 5 other residences complained. This included someone who was undergoing thyroid cancer treatments. I was a wreck. We couldn't walk down our own steps because we couldn't see from the afterimages and the glare. We have metal awnings and all the room darkening blinds and curtains from the last round of terrible sodium vapors. The neighbor was told to put cardboard over their windows. I was told to move somewhere darker. I was also told to shoot the light out. All by a MetEd rep who is a hunting buddy of a council person and will be our last ditch effort with a can of spraypaint to try to "shield" the light, so I'm trying to leave that guy out of it. After 2 months of not sleeping, not wanting to leave the house because it was too dangerous because we were literally blinded every time, MetEd took down the light and put up a less abusive, but still really bad, sodium vapor. The cover fell off and it';s just a bare bulb and the neighbors and I are afraid to call MetEd lest the LED light come back. I have been back to at least 3 more Council meetings with lots of evidence backing me up and a petition rolling in too. They say they're behind us. I do not believe them. Every meeting is like the movie Groundhog Day. I was told to get a petition and a class action lawyer. Why do we need all that if the Council is "on our side" and the LED lights won't be coming back? Why a lawyer for something that hasn't happened yet? They only perked up when I said (again) that the lights had public nuisance legal problems. MetEd has now said they will install unshielded 3000K LED lights everywhere in town. I filed a formal complaint w/ the PUC, who unfortunately approved the new awful lights while I was away trying to do my real job. I have ADHD and PTSD, both of which have been horribly triggered and continue to be triggered because they just put these lights up with no warning. It's happened twice now, and I'm afraid they'll do it again. My husband is a disabled veteran. His problems were aggravated. The Borough Council and Mayor and MetEd reps were offered, for free, a representative from DarkSkyPA (Dark Sky International) to come and speak with them on lighting solutions. They have repeatedly passively refused. They cannot claim deniability. There's too long a paper trail. Due to my online petition, I found out there is a little girl on Main St. whose family moved here because there were no LEDs. She gets seizures from them. This is clearly an ADA issue for many of us and an emergency issue for her. I have photos of what the LED did to our home. I would love to share them and get any advice or help. Legal seems to be all the Council understands. Here is the link to my petition. https://c.org/2htgQdz9Vj One photo is on there. I would be grateful for any help you could give, especially any legal ADA citings like glare interfering with vision, etc.

A.519 April 10, 2026 — Monroe, NC — Migraine

Stadium ultra bright new tall lights in our development. So sick at night in my own development and home. Nothing blocks out the light totally. I've tried it all. Lack of sleep palpitations, headaches , light flashes in my eyes, wake up groggy, horrible. Can't go for walks at night, can leave shades up at night and artificial light from theses come thru the curtains and shades and makes me restless all night! I'm worried what they do to the body! I hate them!! Please have them banned and removed from here

A.520 April 12, 2026 — Boynton Beach, FL — Other

I had a bad car accident last week because a car's lights were so bright that I could not see the road. Why can't Karen manufactures help people that have difficulty driving at night? They are making the problem so much worse instead of better. I'm so disappointed.

A.521 April 14, 2026 — South Holland, IL — Other

I am filing a formal complaint about the rising use of overly bright, full-grille LED lighting on vehicles. These lights cause dangerous glare, obscure the road, and threaten driver safety. Last night in Chicago Heights, a vehicle with ultra-bright LEDs across its front grille temporarily prevented me from seeing the lane ahead. This is the third time in six months I've experienced dangerous glare from similar lighting. These lighting systems seem to breach roadway safety standards. Though often aftermarket, they are sold and used without enforcement. The lack of concern for driver safety and accountability from dealers and installers is troubling. • Investigate the legality and compliance of full-grille LED lights. • Enforce regulations on vehicle lighting brightness and beam patterns. • Advise dealerships and installers to avoid unsafe lighting equipment. • Alert drivers that aftermarket light bars and grille-wide LEDs causing glare are banned for road use. These ultra-bright lighting systems are not merely an annoyance — they are a growing public safety threat. I urge your office to take action before more drivers are put at risk. Thank you for your attention to this matter. I am willing to provide additional details if needed.

A.522 April 18, 2026 — Anytown, NY — Sjogren's

I have to wear glasses. i'm female with a sedan. blinded at night by the powerful lights even by sedans. sometimes i have to stop the car completely because i can't see which is dangerous. please regulate this.

A.523 April 18, 2026 — Fairfield, PA — Other

Hello. I submitted an LED incident report before and haven't heard back yet. I wanted to add something to the report. I am trying to prevent the installation of unshielded 3000K LED lights throughout our entire town. We had a 4000K "preview" light put up last Fall and taken down 2 months later due to numerous complaints. Our Borough Council, who in a newspaper article, said they were behind us 100% now said, in writing, that they will put up whatever lights MetEd (our power company) gives us, which are 3000K unshielded LED lights. The council says I should try my luck w/ the Pennsylvania Public Utility Commission, which I have made a formal complaint. The council is fully informed about the hazards of the lights, informed of alternative lighting, and have chosen to do nothing. We have an online petition. We have an in person petition. No one we have spoken to wants these lights. Please let us know what to do now. MetEd claims we can't make a complaint about a light they have not put up yet. We already saw their "prototype" and said no. The only difference in the light will be it's a little yellower. Here is our online petition that describes the problem. https://c.org/Mjk65dSscq

A.524 April 19, 2026 — Bellefontaine, OH — Other

Been trying to get Shields installed onto the street lights outside of my home for over 3 years now. I've had a lot of different health issues arise since these lights have been installed. Started out having dizziness, then was my thyroid, then my hormones, now my vision. I'm told I have vestibular migraines now. I am now seeing a functional medicine doctor, which has been quite the expense. Finally had a lighting company come out and "dim" one of the lights. I was told they couldn't dim it any lower. He also said he was going to send in a request for a shield to be installed (that was over two weeks ago). We still have no shield. I was also told by the lighting company that I may be responsible for paying for the shield, which would be around $400. Blackout curtains are a joke when it comes to these lights, as the light comes through any crack on all sides of the window (another expense). There has got to be something done about these lights. I would appreciate any help and advice from Soft Light Foundation.

May 2026

A.525 May 6, 2026 — Halifax, NS, Canada — Photophobia

My partner Jen has extreme photophobia that is basically ruining her life and employment. She can't even go into buildings because everything has been switched over to LEDs, she can't get employment barely. Can't use screens. It's becoming a nightmare for her. Just reaching out to see if you have some resources for maybe legal options or a phone number to talk to. She had to quit a job today because of it.

A.526 May 12, 2026 — High Point, NC — Other

My eyes are sensitive to the bright light at night. These new cars have twice as bright headlights as my high beams. So I just run with my high beams on all the time. I see cars, new cars, electric cars, sometimes with double headlights in the front, meaning four lights and they′re all bright. Why?

A.527 May 12, 2026 — Seattle, WA — Other

My vision suddenly changed. I was seeing bright flashing lights in particular blue and white colors. I could no longer read it closed captioning on the TV I could barely actually see the TV. It was terrifying. I walked away from the area where I was watching TV(Under a newly installed LED ceiling light in a fairly closed space/Breakfast nook in the kitchen. I had no idea what was happening to me, and I thought I was going to permanently lose my vision. Thankfully, I went into another room of the house and sat down and slowly my vision started to normalize. There were no LED lights in the room where my vision was restored. It was an incandescent light bulb inside a milk glass shade/Globe. I tried to think out what had just happened to me and I googled about LED lights and found out this has happened to other people as well. I do have dry macular degeneration(Which apparently can be a risk factor) But I had no idea What was happening to me and I felt like I was getting blind suddenly. Was terrifying. My vision is now back to normal and I will be removing all LED lights out of my home. I wanted to let you know this happened so you can address it.. Obviously, very dangerous to vision

A.528 May 14, 2026 — San Diego, CA — Migraine

I can no longer drive, go for walks or even look out of my windows at night because the LED headlights on newer cars blind me. While driving, I′ve had to pull over multiple times to wait for my vision to return to normal. My migraines have gotten more frequent and are triggered by bright LED headlights.

A.529 May 16, 2026 — Albany, NY — Astigmatism

I drive in a constant state of defense, placing away, raising an arm, adjusting mirrors in my subcompact sedan. I knew it was only a matter of time until this caused an accident. I am grateful it was behind a stopped car approaching a light, at a hilly diagonal 4 way intersection on a friday night, but it totaled my car and I fear ever driving again.

A.530 May 20, 2026 — Bellefontaine, OH — Migraine

Started having dizziness along with a bunch of other neurological issues in 2024. Am waiting to be seen by a rheumatologist to rule out sjogren′s syndrome , can′t get into them until July 2026. I′ve been seen by several doctors. This has caused me to have flare ups with my thyroid, vision problems, tingling and leg zaps down to my toes, blood pressure fluctuation, now am having severe headaches. I′ve tried several times to get whole house shields placed on the street lights trespassing into my home to no avail.

A.531 May 21, 2026 — Utica, KY — Photophobia

These lights are way too bright and impair my vision when driving at night to the point I can’t safely see. I have no issues with other types of headlights. If someone behind me has LED it’s very distracting shining in my car and they tend to follow too close behind close and I’m unable to use my rear view mirror or side mirrors due to the glare. It’s a growing problem.

A.532 May 27, 2026 — Chicago, IL — Photophobia

MULTIPLY THIS TIMES HUNDREDS OF TIMES EVERY DAY> OMG I AM LIVING A NIGHTMARE AND SMASHED IN THE FACE CONSTANTLY WITH THE BRIGHTNESS OF OVER EXCESSIVE HEADLIGHTS AND NOTHING BEING DONE!!!! STOP USING US TO HARM EACH OTHER AND IDIOT SELFISH DRIVERS DON′T CARE WHO THEY HARM!!! THIS IS A CRIME CONSTANTLY!!!!

A.533 June 10, 2026 — Houston, TX — None

LED lights from the many trucks in TX blind me while driving in my standard vehicle. It makes driving at night miserable and painful.

A.534 June 11, 2026 — Newark, NJ — Electromagnetic Sensivity

Crazy ass bright police light, Newark PD. I swear, I saw Jesus Christ, go sick um Mark

A.535 June 12, 2026 — Chicago, IL — Epilepsy

Big box stores with LED lights make me sick. It is blinding bright and I can't shop. Costco, marshalls, TJ Maxx, grocery stores, LED lights are in most stores. The only way to shop in person is to wear sunglasses and a rollenz eye shield. The lights are flickering and too bright.

A.536 June 12, 2026 — Kalina Mala, Poland — None

It tires my eyes, I prefer longer-lasting bulbs because LEDs can withstand less (e.g. shocks or heat) and I'm a fanatic of vintage things.

A.537 June 16, 2026 — Oklahoma City, OK — Migraine

Tonight I was driving home after running some errands and there was an oncoming vehicle that had the brightest lights I have ever seen and it's hard not to look that way when the lights are that bright. I push my left turn signal and accidentally flashed my brights at the dude and he flashed me back and they were way brighter than before, so bright that it gave me a migraine and I'm still seeing little white dots after 20 minutes. I'm not sure why we need daytime lights for night time. What's the point? You're not supposed to have lights brighter than street lights on a car driving down any kind of road knowing that there are people out there with epilepsy and other things that can be caused by bright lights which by the way do a great amount of damage to your eyes. I hardly go out at night anymore simply because it's too risky with all the lights being so damn bright

A.538 June 17, 2026 — Madison, WI — Photophobia

My husband needed to be picked up from the mechanic this afternoon and it’s been raining here all day. I was otherwise having a great day and great week. The rain had thankfully stopped by the time I needed to drive. The cloudy weather meant more contrast with the LED headlights and running lights. I had to put my left hand up to block oncoming lights almost the whole way there and back, which feels very unsafe if one of those cars would cross the center line as I would not be able to see it behind my outstretched hand. My nervous system was shot by the time I got the three miles to the mechanic and was far worse by the time I got home. It’s taken two hours and a lorazepam for me to stop sobbing because I feel like I cannot function as a normal human due to the blinding oncoming lights. I just want to become a hermit, grow all my own food, and never have to drive or ride anywhere ever again. I don't know what else to do. I went from feeling great to hopeless and borderline suicidal in 8 minutes of drive time.

A.539 June 26, 2026 — Anytown, USA — Astigmatism

mostly teslas and new cars. Most of these lights are brighter than the sunset and cause lasting blindness after exposure. I constantly fear that one day I will be blinded and accidentally crash my car because of someone else's headlights.

A.540 June 30, 2026 — Goose Creek, SC — None

I have to drive through a pretty narrow and deserted road to get to my house and many times I have been completely blinded by cars driving in the opposite direction and once to the point where I have swerved off the road

July 2026

A.541 July 9, 2026 — Los Angeles, CA — Migraine

I routinely suffer from migraines, eye strain, and headaches due to the mandated LED and florescent bulbs. Incandescent bulbs never gave me a problem and thankfully I stockpiled them and still use them today throughout my home. But I am routinely impacted when at the office, at a friend's house, out in restaurants, stores, etc. The harsh lighting everywhere mandated now by absurd laws is a major problem.

A.542 July 12, 2026 — Sykesville, MD — Other

I have blue eyes and it makes it 10x more difficult to drive at night. I have to flip my rear view mirror up to reflect the light away from my eyes.

A.543 July 19, 2026 — Los Angeles, CA — None

So glad to find this website! In January (when it gets dark so early), I nearly hit a jaywalking pedestrian after being blinded by LED headlights. TWICE. In the first case, a woman walked her daughter from between two parked vehicles in the middle of the road as I was blinded by glare from an oncoming vehicle. In the second, a homeless man crossed against the light, and though I was green to go, I barely saw him because of the lights of the high-sitting SUV behind me. Had I hit either of these suddenly appearing jaywalkers, I might have lost everything—while the owner of the blinding vehicle (not to mention the auto manufacturing industry!) would have driven merrily away.

A.544 July 21, 2026 — Anytown, NA — Migraine

LEDs were invented as weapons to break up demonstrations. Incandescent lamps were invented to illuminate homes; they have a natural spectrum! Energy savings are nothing compared to the harm from LEDs! LEDs blind (that's why they were invented), cause vasospasm in the head, the head is tightened with a hoop, the human aura is irradiated, the pulse rises, dizziness, panic attacks occur! Please pay close attention to the problem people!

A.545 July 23, 2026 — Carroll, NE — Astigmatism

I simply cannot see. I am continuously blinded by these lights. I put my visor down to help block them. I do all the suggested things, that normal drivers do. It does not help. These lights are too intense. Not too mention, the common courtesy that was once taught for drivers, has become rare. Drivers are leaving these intense lights on without dimming appropriately, following with the brights on, and then there is the issue of the vehicles that have 4 and 6 lights on them. It is too much! There is a definite need for safety standards to be made here.

A.546 July 30, 2026 — Minneapolis, MN — Other

We are a 50 + year old multi sensory design research lab. Since there is no way to contact you on your site, you may find a conversation about LED design and research interesting. Peace, Steve Orfield

A.547 July 31, 2026 — Wappinger Falls, NY — None

The cars with the blinding LED lights are a real problem for me. I have to actually look away while driving and look at the road line to see where I'm going. It's an accident waiting to happen.

August 2026

A.548 August 2, 2026 — Crestline, CA — Other

My husband has a neurological condition and LED's lights are stealing our life from us, stealing our quality of life and freedom! We only feel safe at home where we have incandescent bulbs. Every environment outside of our house is hostile and it has a very negative impact on our physical health and mental health. The car headlights are blinding even during the day because of LED's. We rush our shopping to minimize the exposure. We can't go to certain stores and restaurants. We don't have a choice but to go to a grocery store with super ultra bright LED's, and we just wish we had another option. We wear specialty photosensitive glasses hoping to make our lives more livable in the LED nightmare, but even with the strongest glasses we still suffer the effects of these lights. We feel we can't go anywhere and experience life normally. Because the lighting is like an alien laser beam destroying our brain and well being and ability to function in society. We feel powerless and sick contemplating the injustice of this situation. I hope things can get back to normal because we have been losing our minds. Also people close to us don't understand the harm. Thank you Mark Baker and team for everything you are doing!

A.549 August 3, 2026 — Anytown, TX — Astigmatism

Got blinded while driving. As in big black spot I could not see for two minutes or so

A.550 August 4, 2026 — Camarillo, CA — None

Lack of sleep

A.551 August 9, 2026 — Chicago, IL — Other

It's now 2026 August and STILL NOT ENOUGH being done. I like you am BLINDED DAILY as soon as I step outside. No more able to drive, walk or just be outside!!!! Freedoms lost and the other day I used an LED yet the driver who blinded me sped around to follow and trap me in my motel room!!!! When I called him a hypocrite and that he blinded me he yelled I DON"T CARE !!!!!! Violence is what they want as if we don't have enough problems. What this boils down to is the DRIVER of the car COULD do something and cover or TURN THEM OFF and why they are on in the DAY MY GOD how stupid Americans are!!!!! Very sick and sad to blind kids who don't know better not to look and babies. Horrible nothing done still. Our police are trying and I'm making presentation of common sense to help. We shouldn't sacrifice our vision!!! When police go blind all hell will break loose!!!

A.552 August 11, 2026 — Auburn Hills, MI — Migraine

Because of the blinding LED lights on vehicles, I am considering not driving at night any longer. They temporarily blind me, so I have to look away at the side of the road as they pass by. This is extremely dangerous as our city also have a sever deer overpopulation and they run out onto the road at night. I also suffer from migraine headaches and have experienced an increase when exposed to more LED lights. With these health and safety issues in mind, it is logical to switch back to incandescent lighting. Especially since Bill Gates said the climate crisis is over!

A.553 August 19, 2026 — Albuquerque, NM — Astigmatism

Its very scary for me to drive at.night.The br8ght l8ght blind me and I struggle to see the lines on the road after incoming traffic blinds me. The lights make auras around them and it causes a lot of strain. My eyes hurt afterwards from having to focus so hard I just don't drive at night anymore. I also hurt in a movie theater so I don't go to the movies either. The screen is so bright I also see auras and the flashing colors hurt my eyes and I need to look away. Last movie I went to 7 years ago I left my family at the theater watching the movie and took an uber home so I don't go to movies either. I did find a few overpriced incandescent bulbs for my house and that is what I use at home. Computer work is also hard for me. I heep the screen very dim and since I retired I put the laptop away in the shed and life is better not having to look at the screen every day

A.554 August 19, 2026 — Blue Bell, PA — Other

DO NOT FEEL WELL AROUND LED LIGHTS. NAUSEOUS. FIND THE LIGHT UNSETTLING.

A.555 August 19, 2026 — Columbus, IN — Migraine

I'm an FCC-licensed Extra-Class Amateur Radio Operator. LEDs in my home interfere with radio reception, including both "ham" radio and local commercial broadcast radio stations. LEDs in my neighbor's yard lights emit broadband signals all across the VHF spectrum that make it impossible to hear any but the strongest radio signals in the 2-meter band. Besides violating FCC Part 15 rules & regulations, these "low voltage" yard lights, these lights are emitting radio signals that create health hazards.

A.556 August 19, 2026 — Kitchener, ON, Canada — Other

Blinding during night driving

A.557 August 19, 2026 — Lake Forest, CA — Other

Other was chosen as health issue because so many things have happened to me since my state has outlawed incandescent lighting. My emr symptoms are terrible (headaches, brain fog, body pain, chronic fatigue) My vision in which was fabulous my entire life has turned upside down. I developed rapid growing behind lens cataracts in both eyes. After getting them replaced in two years I developed secondary cataract. Both issues needing expensive surgeries and my eye sight never to return as normal. My entire household has suffered eye vision decline. The driving at night with a city of led lights is difficult. The shopping at markets has become a horrible event. We deserve to be able to use non Led / blue wave lighting in our homes and cities.

A.558 August 19, 2026 — Lancaster, PA — Other

Extreme discomfort from the glare of these LED lights, intense eye blinding.

A.559 August 19, 2026 — Las Cruces, NM — Other

LED's are very disruptive to humans, animals, birds and our environment. They are not compatible with our eyes, are damaging and very difficult to be around. They are especially hazardous in vehicle headlights because they temporarily blind the driver encountering them on a highway. No doubt, they have already caused numerous accidents. This spectrum of light can trigger migraines, seizures and other health incidents in more vulnerable people, especially those with underlying conditions that are aggravated by LED lights. They are disorienting to our wildlife and the opposite of the calm environment produced by incandescent lights. Please stand up for us all! Ban hazardous LED's and incorporate beneficial INCANDESCENT LIGHTS again. The health and wellbeing of people, our fellow travelers and environment, should be the #1 priority of those we elect to serve us.

A.560 August 19, 2026 — Modesto, CA — None

We've been noticing this for a while especially at night...the LED headlights are so bright it blurs your vision & even causes the area to not be visible. It's worse at night but even those that leave their headlights on during the day there's still an impact on your vision when LED lights are coming at you...walking or driving.

A.561 August 19, 2026 — Netherlands — Other

Am an airline captain, whereby, among other, my vision forms a very important aspect of safety. LEDs do impact my health negatively, we are nowadays exposed to numerous sources of LEDs (lighting in buildings, lights in aircraft, street lights, car headlights, smart phones, tablets, etc etc) LED=new asbestos. As always, also with LEDs, governments do nothing for health, but let businesses reap major profits first, amd then, years later come with the same story "ooh, we did not realize it was harmful". Another "safe & effective" lie, as with the harmful Cojona experimental gene therapy mRNA injections.

A.562 August 19, 2026 — San Antonio, TX — Migraine

The LED lighting in my office causes me to get migraines. Because of this, I have to keep my office light off, and use a table lamp. Today we had a meeting in the conference room, and the overhead lights remained on. I began to get an aura (that's how I know a migraine is coming) and had to get my sunglasses to wear for the duration of the meeting. I am highly sensitive to LED lights and it affect me even when driving and the oncoming vehicles have LED lights. Because of this I have stopped driving after dark.

A.563 August 19, 2026 — Sonoma County, CA — Other

The LED lights at work make me feel tired with difficulty concentrating after a few hours. The other work site does not have LED lighting so I am able to compare. I turned down an offer for more hours at work only because of the way the lighting there at the site with LED makes me feel too drained by end of work day.

A.564 August 19, 2026 — Wilmington, DE — Other

Left pupil doesn't react and because of this LED light FLOOD S into my eye blinding me. Light SO BRIGHT it can cause an ACCIDENT!!!

A.565 August 22, 2026 — Austin, TX — Other

Two children were riding bicycles, one with an extremely bright light mounted on their handlebars. I was driving towards them, the child without a headlamp was riding in the middle of the road and I could not see them. I only saw the child in the middle of the road a the last second and barely was able to swerve towards the curve after passing a parked car. Thankfully I did not hit the child or the parked car. The child's bicycle light was excessively bright and blinding.

A.566 August 24, 2026 — Palos Park, IL — Other

I am a twenty one year old male with vertigo. Because of this I try my best to stay away from harsh sounds and lights as they very often trigger violent dizziness and extreme nausea. With the increase

of newer cars all having harsh bright white led headlights I cannot escape the blinding and vertigo causing cars on the road. So today I drove to work at approximately 4:30 am CST. A newer audi driving behind me happens through a bumpy section of the road where I then receive what feels like fifteen, one second bursts of blinding light come through both side mirrors and rearview the mirror instantly causing a bout of vertigo making me dizzy and forcing me to dangerously finish my final two turns into work and go about my day unable to eat or drink due to the nausea and not operate certain machinery because of the dizziness.

A.567 August 25, 2026 — Boca Raton, FL — None

I have noticed over the last few Years that every time I go into a big box store whether it be a grocery store like Publix or target Costco or HomeGoods. I do not feel well after being under the lights in the store. I never noticed this in the past, but I definitely feel that over the last several years. Brain fog and just generally not feeling well until I leave the store. I never had this in the past

A.568 August 25, 2026 — Camden, NJ — None

Between the new LED lights on vehicles and the lights on EMS vehicles which are brighter than on older vehicles, it has become increasingly difficult to see at night with all the extra glare coming in my general direction when coming on the opposite side of traffic. The glare makes the eye sensitive enough to blind you for seconds and when caught off guard with vehicles coming in or out of traffic, it can be a danger to not only wildlife but also pedestrians and cyclists on the road.

A.569 August 27, 2026 — Aiken, SC — Astigmatism

People driving and parking with the LED lights is perceived as the most awful amount of light to my eyes. Making it hard for me to park or drive opposite of them.

A.570 August 28, 2026 — San Diego, CA — None

The new LED car lights are blinding.. makes it very hard to drive at night.. please come up with a better solution

A.571 August 29, 2026 — Paris, TN — Astigmatism

I have a hard time seeing at night as is so when a car with LED or HID headlights come towards me it′s the worst feeling that I could get into an accident.

A.572 August 31, 2026 — Davis, CA — Autism

I went into a CVS Pharmacy. At the counter, they had a computer screen with an attachment on the bottom that seemed to be a laser that was projecting a big green X on the countertop. But it was flickering. Within seconds, my heart was pounding and I had to take a knee on the ground. We figured out that I could place my hand over the laser to block the light so that I could make my order, but I was left stressed out for hours afterwards.

September 2026

A.573 September 2, 2026 — Davis, CA — Autism

I encountered LED RRFB strobe lights in the City in three separate events less than an hour apart. Each time, I went into fight or flight mode. But the third time, I felt close to hyperventilating and was shouting profanity in my car. It too me hours to calm down afterwards.

A.574 September 9, 2026 — Blasdell, NY — Migraine

I have been working at my company for almost 3 years. I have NEVER been diagnosed or had migraines or migraine aura until this year. We moved to a new building with LED lights on the ceiling. They are directly above my head approximately 7ft for 8 hrs 5 days a week. I have migraines and migraine aura, nausea, eye strain, trouble sleeping and dizziness. It ruines my day after work. Some days are spent sitting in a dark room by myself. I am unsociable and irritatable. Then I have to go back again the next day to deal with it again. It has greatly impeded my work. Its depressing. These lights are in a defense manufacturer who makes very important parts for the government. They should NOT be there. Please do something about this. Thank you

A.575 September 10, 2026 — Dallas, TX — Astigmatism

Developed astigmatism

A.576 September 11, 2026 — Yakima, WA — Astigmatism

I dread having to drive at night. In the city the glare from these ultra bright lights hurts and is blinding but I also have to drive down a dark highway on my way home and in the moments that I'm met with these LED lights I am often blinded for long stretches of road only having a handful if feet to see in front of me. That's even if I can bare to look at the road with out my eyes hurting.

A.577 September 17, 2026 — Wellington, CO — Other

I drive to work early morning (when it's dark). 55-65 mph area. My eyes are light sensitive. Down a 2 lane county highway. LED headlights with blue / white color are very disorienting. Especially pickup trucks and Semi trucks. The height of their headlights are close- to - equal to my height & line of site while driving. Causing me to having to constantly look down, to my right for the solid, white line. In most instances I am unable to differentiate if the oncoming driver has their bright lights on. In addition, there are hills. So an oncoming driver's headlights have variations. Sometimes not so blinding, then very much so. Even in town, when driving at night it's intrusive and usually miserable with LED headlights oncoming & from behind. Often I will pull my driver's side, side mirror inward to avoid the light in my eyes. This was never an issue before LED headlights came to be in vehices.

A.578 September 19, 2026 — Port Angeles, WA — Migraine

I have to take a rescue medication to go outside at night due to led spotlights, headlights, signs, street lamps, stop lights, and flashlights since they all trigger severe migraines that leave me bedridden without rescue meds and taking the meds too frequently is bad for your health so i avoid going out after dusk.

A.579 September 24, 2026 — Anytown, IA — Astigmatism

The plague of super bright white LED lighting has made driving much more difficult leading to me needing to wear yellow tinted clip on lenses over my glasses to take some of the sting out of them. Today as I was driving to work and an oncoming vehicle with blinding white LED headlamps was impairing my vision enough that I did not see the deer that ran out in front of me until I hit it, likely totaling my vehicle. I have been driving this vehicle for 10 years and never once had a problem spotting deer in the ditches even with oncoming incandescent bulbs.

A.580 September 25, 2026 — Mammoth Lakes, CA — Autism

I was a passenger in a vehicle driving east on Meridian Blvd. when we encountered two traffic signs with 6 LED strobe lights flashing at about once per second. Four of the LEDs were "white" and created significant glare. The overwhelming intensity and number of LED strobes caused me to involuntarily close my eyes because of the pain, and utter profanity as I felt the fight-or-flight urge. I remember that one of the signs was a speed limit sign, but the sensory overload of the LED strobes made it so I don't even remember what the second sign was for.

A.581 September 27, 2026 — Linden, NJ — Other

I was stuck in bumper to bumper traffic at 8pm. We were going 3mph for over an hour. I had a truck behind me with bright LED lights. They were shining in my side view and rear view mirrors, into the interior of my car and I could see a full outline of my vehicle on the truck in front of me. The interior of my car was like daylight. I could see my hand perfectly when I held it up to block the glare coming from the side view mirror. Once I was out of the traffic I could barely see and had a hard time referencing distance and it messed with my depth perception. I almost got into an accident.

A.582 September 27, 2026 — Pullman, WA — Astigmatism

Every morning I have to drive to work at 4:30 am. And EVERY morning I am blinded by other vehicles LED lights to the point that I have to actively hold up my arm to block on coming light to shield my eyes. If I do not physically block the light from my eyes, then the residual glare takes five to ten minutes to clear from my vision. I have nearly been forced off the roads by glaring LED in on coming cars making it impossible for me to see the road. Im constantly worried one of these mornings I will wreck my car from being blinded. 2026 is the worst year I have dealt with this issue so

far. And every year it gets worse. I also suffer from chronic migraines and these LED lights are tourcher for photo-sensitivity symptoms.

A.583 September 29, 2026 — Torrance, CA — Autism

I was driving in LA on 405 South near the 101 Freeway interchange today at about 7:00 PM (Sunday, Sept. 27th, 2026) and I saw one of your portable changeable message signs warning to expect delays or something (due to the construction on the 405).

This particular sign had 4 bright flashing yellow circle lights below and above it to catch drivers attention (see attached cartoon). These signs used to have a more reasonable flashing lights that cycle every half second or so. I'm scared that these strobing ones will become the norm. These high frequency strobe lights cause my nervous system to become overwhelmed and I'm temporarily in a state of confusion / near paralysis. This is extremely dangerous for me and other drivers on the road.

October 2026

A.584 October 1, 2026 — Denver, CO — Electromagnetic Sensitivity

headlights send me spiraling. sets me off

A.585 October 1, 2026 — Houston, TX — None

I drive to work at a factory every day around 4:00 AM. Several cars turn off onto the same exit to get to that factory, and all the bright lights make it very difficult to focus and see.

Specifically today, three or four different cars behind me while I was navigating to the correct entrance had LEDs that strobed either due to maybe flashing or through the change in angle on the LEDs based on road jostling. I nearly hit the curb. Thankfully I'm okay, but these sorts of incidents happen at least once a week.

A.586 October 1, 2026 — St. Leonards-on-Sea, United Kingdom — Photophobia

I live on the seafront and there is a cycle path and very bright street lights. When cyclists ride in the evening with led light , I am blinded ftom a long distance away , I can’t see anything but the light and it hurts my eyes and I have to shield them. This time I stopped the cyclist, who was a young man to try to explain to him what how his light was affecting me and other pedestrians. He insisted it was for safety snd that his light was pointing at the ground in any event. When I disagreed with him he said I wasn’t listening. I said it’s not been dark the lights are so bright. He said I wasn’t listening even through the opposite was true. Accused me of being rude and cycled off. He also had a flashing red led on the back of his bike. My health is really being affected by all these lights. I can no longer enjoy an evening walk and I feel ill from these lights. Please ban them.

A.587 October 4, 2026 — Burlington, VT — None

I can not walk outside after dusk without LED lights from cars blinding me when I walk on the sidewalk. I have to wear sunglasses when there no sun out. I have to cover my eyes. I've litrally walked into other people before because I CAN'T SEE due to LED headlights blinding me.

A.588 October 4, 2026 — Flagler Beach, FL — None

I cannot drive when the horible led lights from the street or head lights from cars. I avoid going into Walmart because of the horrible lighting all over inside and out. Headaches, eye soreness, not to mention irritability etc...

A.589 October 6, 2026 — Prineville, OR — Migraine

Me and my mom were driving back from a different town at night when this truck passed us, we thought he had his brights on because they were so blindingly bright, they were brighter then our brights, so my mom flashed him with hers but they weren't. Someone else's lights normally should not be brighter then someone else's high beams. Since she did that he did it back with his actual brights and I could not see for a while after that, and it really hurt too. my mom had to close her eyes while driving so she didn't get blinded. Another time I was with my dad, it was night and this other car was was coming up from pretty far away, I wouldn't know exactly but they weren't even that close to us yet but their lights were so bright we couldn't see infront of us. It's so stupid because why are we

being blinded from that far away? Anyways, there was a deer in front of us that we couldn't see up until last minute. Luckily my dad was smart and was going super slow but if we had been going any faster with those lights blinding us from that far away, that would've not only been unfortunate to the deer but damage to our front end as well, maybe would've even led to a wreck. And I'm tired of hurting every time I go somewhere at night.

A.590 October 6, 2026 — San Francisco, CA — Astigmatism

The cool, very piercing bright lights on newer cars, especially Tesla, is making it harder to drive at night. They are blinding and then I see spots after they pass. It is now almost constant. I would really like the lumens to be lowered or more regulated. While the cars driving with those bright lights can see well, it blinds everyone around them.

A.591 October 11, 2026 — Poteau, OK — Other

8/27/2026 around 9pm, I crashed a limousine due to oncoming headlights blinding me on a 2 lane county bridge, from the front bumper to the rear bumper, causing me to scrape the bridge, and totaling the vehicle. It scraped the entire side of the limousine. My commercial vehicle insurance company labeled my accident as "At Fault", because there was no contact with the other vehicle. Now when I replace the limousine, I'm confident my premiums will go up significantly.

A.592 October 13, 2026 — Chicago, IL — Migraine

LEDs on streetlights in general but specifically in my local park are giving me headaches and ruining my experience at night.

A.593 October 14, 2026 — Temperance, MI — Astigmatism

My adult son is autistic. We have a large neighborhood and we go biking and walking at night because the roads have less traffic so it's safer and peaceful. LED lighting is now ruining this experience for us. As neighbors are installing LED lights that are as bright as stadium lights without pointing them down or using shields, as well as the cars with their blinding LED headlights increasing in number each day, we are getting blinded and actually have to pull over until we can see again. Then another car or 2 drive by, and another neighbor puts in 5 lights they don't need, and we're pulling over again. There used to be some roads where people still had the nice warm golden lights and our eyes could catch a break, but that is going away. We bike to a school where we park and walk laps. A house in the neighborhood across the street put up a porch light that actually lights up the entire school parking lot! We now have to put our hands up or close our eyes during some of our walk. Then we go home and I usually have a headache and am still seeing spots when I go to bed. Now our neighbors behind us and in front of us have put LED lights in without a shield or pointing down, and they're lighting up the entire length, front and back, of our ranch home. So if I don't want blinds closed and want to feel fresh air, I have to deal with their unnecessary blinding lights. Who ever would have thought that the simple act of biking, walking, looking out your window, night driving or sitting comfortably on your porch would be taken away with no regard to how it effects humans, retinas and wildlife. Unbelievably cruel. LED lights are certainly not progress. They're taking us a huge step down.

Appendix B — Public Comments on the Petition to Ban Blinding Headlights (Complete Record)

This appendix reproduces the public comments left on the petition described at Part VII.G: 4,991 comments, the earliest dated November 17, 2016 and the latest October 12, 2026. Each was written by a member of the public who signed the petition. The Foundation reproduces them because Part I states its reason for doing so: a signature total is a number, and what the signatories wrote is evidence.

What has been removed, and what has not. The petition platform records each signatory's name and postal code. Neither appears in this appendix. The Foundation has taken the view that the city and the state, or the city and the country, are as much as the Department needs in order to weigh a comment, and that nothing is added by naming the person who wrote it. Two comments contained an electronic mail address and three addressed another signatory by name; those are marked where they have been removed. Nothing else has been altered. Spelling, punctuation, capitalization and grammar are the commenter's own.

Order and numbering. The comments are in date order, earliest first, so that a comment left after this appendix is built can be added at the end without renumbering any comment the comment cites. Where several share a date they are ordered by place. The dates are given as the platform records them, converted to a uniform format.

Location. Where the signatory gave a city and a state, both are shown. Where no state was given, the city and the country are shown. One hundred and sixty-two signatories gave neither a city nor a state, and for those the country alone appears. The platform records signatories in forty-seven countries.

The Foundation reproduces each comment without adopting its contents. Many assert a causal relationship between light-emitting diode emission and a condition the commenter describes. Those are the commenters' statements of their own experience and belief, not findings, and the Foundation does not advance them as findings. Part VII.A.5 states the same limit for the reports at Appendix A and it applies here with equal force. Some comments argue with each other, some are addressed to no one in particular, and a few concern subjects outside this proceeding. They are reproduced as left.

Comments left in 2016

November 2016

B.1 November 17, 2016 — Aberdaron, WLS, United Kingdom

These lights are dangerous. Medical evidence says the automakers are exceeding safe limits. Why are they allowed to get away by killing people all for a marketing gimmick?

B.2 November 17, 2016 — Ann Arbor, MI

I am signing this because I have been an opponent of too-bright lights for a long time. NHTSA lied to me in writing that they would do something "soon" about the too-bright daytime running lights when first allowed in the 1990s. Some 17 years later "soon" still has not arrived. The entire issue of too-bright lights has been a disastrous failure by NHTSA.

B.3 November 17, 2016 — Bethlehem, PA

I have been terrorized by blinding lights of oncomimg vehicles. This has curtailed night driving for me.

B.4 November 17, 2016 — Bethlehem, PA

I agree that this is dangerous

B.5 November 17, 2016 — Burbank, CA

I'm signing because I daily get headaches from these blue headlights. My near-accident rate is also increased due to the blinding effect on my ability to focus at night.

B.6 November 17, 2016 — Canberra, Australia

I totally support this petition against the "lightmare epidemic" that has swept the world in recent years. Headlights, DRLs, fog lights and even reverse and brake lights have become WAY too bright, as regards both comfort and safety.

B.7 November 17, 2016 — ENG, United Kingdom

As a migrainer (and as such being very sensitive to these new kinds of overly intense and blue-rich white lights) and also flashing lights at high frequencies - I find these kinds of lights on both cars and bicycles not only trigger many multiple ill symptoms, but are also a major deterant to my ability to be able to drive or cycle on the road safely. Lighting on vehicles and bicycles has gone senseless - we don't need such intense and overly bright blue-rich white lights to light our way at night. LED Bike lights flashing at fast speeds are actually highly annoying and very uncomfortable. In short - These lights are a deterant to road safety, being able to see properly on the road at night and are a major source of disability glare. Research has shown that such lights don't increase road visability at all, but actually rather drastically reduce it. Because of blue-light scattering and reflection - they also provide less visability in rain, wet conditions and fog. If you have intense, blue-rich harsh light shining into your eyes whilst you're driving you won't be able to properly see or discriminate between that and other visual stimuli in your perepheral vision - and vice-versa. Let's stop the madness. See lightaware.org #BeLightAware

B.8 November 17, 2016 — Edinburgh, United Kingdom

This is an issue that concerns people across the world - and it is so unnecessary! I write as a non-driver living in the UK, who is regularly dazzled by the headlights and daytime running lamps of passing vehicles. If this affects me, as a pedestrian, it's obvious that the potential danger to and from drivers having their vision temporarily impaired is so much greater.

B.9 November 17, 2016 — Granger, IN

As an electrical engineer who has investigated in detail outdoor lighting issues, I see the current trend toward brighter automotive lights with higher blue content as innovators exploiting a dangerous regulatory loophole. LED technology offers plenty of solutions with lower blue light content at only a marginal increase in cost. Only through regulations will auto makers adopt these better LED technologies.

B.10 November 17, 2016 — Indianapolis, IN

Thank god, these lights are so stupid. The mercury argument is weak, the higher frequency light is blinding. This is the most no brainer, and I'm stunned that we continue to elect congressmen without education

B.11 November 17, 2016 — Kenilworth, ENG, United Kingdom

I have written to the British government 5 times., and every time they tell me its safer with light on

B.12 November 17, 2016 — Ley Hill, ENG, United Kingdom

Can't stand bright headlights

B.13 November 17, 2016 — London, ENG, United Kingdom

I've had to stop driving at night because of them, and that includes blinding brake lights too. As a working musician, they've ruined my working life, and I now think LEDs, over bright headlights and mandatory DRLs should be banned, or at least a sensible limit imposed on their output.

B.14 November 17, 2016 — New Canaan, CT

Cadillac in the 1960's used to have a sensor on the dash to dim lights to on coming traffic automatically. It would be a cheap fix.

B.15 November 17, 2016 — New York, NY

YES, Please put a ban on all headlights that are over 3200k. Higher temperature light is blinding in the dark and simply a hazard to drivers as well as damage to our eyes. LED lights, sodium vapor lights, should not be used for car headlights or brake lights. Also the tint of headlights (blue, pink, green, we have all seen them) should also be banned. When light of any intensity is reflected in rearview mirrors it is amplifed and even brighter, as what a mirror does to light. Super bright headlights become blinding and overwhelm the driver. I literally have to turn all of my mirrors down to avoid being blinded. Please act on this.

B.16 November 17, 2016 — Tempe, AZ

DRLs are a hazard due to the glare they cause.

B.17 November 17, 2016 — Tucson, AZ

I hate the blue headlights!!!!!!

B.18 November 17, 2016 — West Los Angeles, CA

I am a daily bicycle commuter.

B.19 November 17, 2016 — Worksop, ENG, United Kingdom

The sooner they ban these LED lights the btter

B.20 November 17, 2016 — santa clara, CA

These headlights are very dangerous for Motorcyclists and bicyclists since while blinded by these lights motorist do not see smaller vehicles. If you cannot see at night with normal head lights then you should not be driving at night.

B.21 November 18, 2016 — Brooklyn, NY

These LEDs are simply blinding, dangerous and not necessary.

B.22 November 18, 2016 — Corona, CA

All auto manufacturers are responsible to recall autos and modify lights that do not meet safe DMV requirements. It is getting worse.....

B.23 November 18, 2016 — Fairfax, VA

I have sensory processing issues. Many of these painfullt bright headlights blind me, and flashing turn signals cause me to stumble, sometimes into the street. These things are dangerous.

B.24 November 18, 2016 — Llanfrothen, WLS, United Kingdom

I am signing because I agree that headlights are so bright and blinding. They draw the eyes when you are driving and makes it almost impossible to see when walking and cycling.

B.25 November 18, 2016 — Petaluma, CA

I am signing because I can no longer drive at night because of the blue headlights.

B.26 November 18, 2016 — Richfield Springs, NY

There is absolutely no reason to have these lights except for someone wanting to make miney on a fad. get rid of them!!!!!

B.27 November 18, 2016 — San Francisco, CA

LED lights are especially blinding for the elderly as our eye gradually deteriorates.

B.28 November 18, 2016 — Stoney Creek, CA

I have had many problems with these types of lights, especially when a truck comes behind a car and the lights now blind everything in your mirrors and make it very hard to see. This is very disturbing that the auto industry has allowed this and who tested this.... I wonder

B.29 November 19, 2016 — Chico, CA

Please sign this

B.30 November 19, 2016 — Corvallis, OR

Blinding headlights and daytime lights are a menace to public safety and should be banned.

B.31 November 19, 2016 — Crystal, ME

LED and HID headlights are so blinding, I've actually had to come to a complete stop on the road until they are past me because I cannot find anywhere to set my vision that allows me to safely continue until they are past me. They obviously must be responsible for some devastating motor vehicle fatalities, and have necessitated my stopping night time driving.

B.32 November 19, 2016 — Fresno, CA

Very distracting and dangerous from all angles (oncoming, rear or side views), especially raised vehicles.

B.33 November 19, 2016 — Monrovia, CA

There are way too many vehicles with headlights that are blinding to other drivers.

B.34 November 19, 2016 — Sacramento, CA

I have been a bicyclist for 30 plus years, and cannot figure out why there is a need for even brighter lights when I thought the existing headlights on cars were good enough. If the number of accidents hasn't gone down this should be the most blatant of all messages to the manufacturing industry to re-assess the rationale behind a need for brighter lights.

B.35 November 19, 2016 — Santa Rosa, CA

I'm signing because these headlights have been blinding me for years. and no one would listen!

B.36 November 19, 2016 — Wheaton, IL

Particularly the LED headlights need to be better regulated or banned if they can't be made less blinding. You can always tell when there is a new Acura or Audi coming at you

B.37 November 19, 2016 — canyon country, CA

these lights are dangerous the low beam of today is brighter than the high beams of yesterday, and laws were written to dim high beams of yesterday and now the lowbeams are brighter

B.38 November 20, 2016 — Coldwater, Canada

Dangerous & blinding. Would have thought automotive companies would have tested them before making such a ludicrous decision!!!

B.39 November 20, 2016 — Los Gatos, CA

This is a pet peeve of mine. We used to distinguish between normal headlights and "brights", the latter being appropriate only when you found yourself alone on the road. Now many of the new cars have "normal headlights" the exceed what "brights" used to be. They are blinding to both oncoming traffic and to traffic in the lane ahead of you. Please create legislation that regulates this and keeps us all safe.

B.40 November 20, 2016 — Merced, CA

I'm a truck driver & am blinded all the time

B.41 November 20, 2016 — San Rafael, CA

I am sick of being blinded by the light of some new cars--these lights are a hazard on the road and need to be recalled or made easier on the eyes of on coming drivers.

B.42 November 21, 2016 — Clear Lake, WI

I would like to see all daytime headlights (except motorcycles) banned and replaced with the Amber daytime running lights.

B.43 November 21, 2016 — Fort Worth, TX

Scares the livin' daylights out of me ! For safety sakes, I try to pull over to the right and stop till the driver disappears from sight.

B.44 November 21, 2016 — Munfordville, KY

I have a hard time driving at night because of the blue LED blinding headlights.

B.45 November 21, 2016 — Rockport, MA

They are so bad, many people won't drive at night. (Me included) Please ban these blinding headlights. Terrible invention.

B.46 November 22, 2016 — Pasadena, CA

I recently took the written section of the Driver's License Exam in California. One question asked what you should do if blinded by headlights. The correct answer: look down and to the right! How safe is that???

B.47 November 22, 2016 — Stamford, NY

Seriously people - we need to stop this dangerous trend before it creeps into all new vehicles! Read, learn, and take action!

B.48 November 23, 2016 — Colwyn Bay, WLS, United Kingdom

day time running lights are extremely dangerous

B.49 November 23, 2016 — Greifensee, Switzerland

Automatic cornering lights should also be banned.

B.50 November 24, 2016 — Ash, ENG, United Kingdom

I'm signing because I'm fed up with having to dip my rear view mirror on bright sunny days because some idiot comes up behind with lights blazing. Also fed up with lazy drivers who sit in front of me at traffic lights with their foot on the brake instead of using the handbrake.

B.51 November 24, 2016 — Bethesda, MD

I couldn't figure out why I was suddenly being affected by these lights, especially at night. I thought it was just me--even though my vision hadn't changed--until I read all these comments. These lights are deadly dangerous.

B.52 November 24, 2016 — Tuam, Ireland

They give me nauseating migraine just to catch a glimpse, I can't go outside at night now because of LED car lights (and LED street lights -separate issue). Never mind that many drivers I know feel they are bullied off the roads by LED and HID headlights and break lights. It's so difficult to see what's around that particular oncoming car or what's coming behind it, be it another car, pedestrian, cyclist. They are absolutely lethal and how car manufacturers are allowed put them on cars I just don't understand. They use LED as a selling point yet they are extremely dangerous and manufacturers continue to promote them and increase their strength and intensity. It's unbelievable how this is allowed to happen.

B.53 November 24, 2016 — Valley Springs, CA

As a sufferer of frequent migraines, with bright lights being a major trigger, I stand behind this 100%. I am also the only licensed driver in a household of three, one of which often works nights, which means I cannot simply choose to not drive in the dark. These ultra-bright lights are definitely a hazard and should be banned.

B.54 November 24, 2016 — Weston-super-mare, ENG, United Kingdom

I am signing this because binding vehicle lights - whether from cars or bicycles - are an absolute hazard for road users. We urgently need to get back Due Diligence as well as good old-fashioned consideration for others who share the space with us.

B.55 November 24, 2016 — Woodbridge, VA

I believe it would serve driving safety and would save lives.

B.56 November 26, 2016 — Weston-super-mare, ENG, United Kingdom

These lights are horrific and very debilitating. As a cyclist, I regularly have to get off my bicycle as I lose my orientation due to a an oncomer's bright lights. This is ridiculous! What has happened to good old-fashioned consideration? And what about common sense? Vehicle lights - and lights in general - need to be adequate, not over-imposing! Regulations are urgently needed to stop this madness.....

B.57 November 27, 2016 — Irvine, SCT, United Kingdom

It's causing deaths

B.58 November 27, 2016 — San Rafael, CA

I'm signing because this has been a serious problem for me when driving at night.

B.59 November 29, 2016 — Louisville, OH

I have been increasingly blinded at night by new cars with projector headlights and know many others especially my age and older who say these cars are making driving at night hazardous enough to make them wonder if they will have to stop driving at night. These cars make more light than others do with their high beams on and it's dangerous.

B.60 November 30, 2016 — Bristol, ENG, United Kingdom

It is a miracle I have not been involved in an accident, which would have been through no fault of my own. Every day I am dazzled and blinded by these extremely dangerous headlights. It is unacceptable to have them in use on the road. These dangerous headlights must be removed immediately to save lives.

December 2016

B.61 December 4, 2016 — Plano, IL

Tired of the bright white/blue headlights all night, every night. I can not see because of them

B.62 December 4, 2016 — Yarmouth, Isle of Wight, ENG, United Kingdom

I'm signing because this year I was afflicted by pain in my right eye from an LED light outside my window. This week I am moving house at great financial and emotional expense. Too many people don't seem to understand the harm caused by LED lights.

B.63 December 5, 2016 — Collierville, TN

I cannot see at night! This is getting crazy. I'm 51 and over the past 2 years these lights have gotten brighter and they, the people who have them (after market) lights seem to gain joy out of getting behind your vehicle and blinding you ! This is a crime in my opinion. I've almost wrecked on several occasions and try and slow down so they will get the message but they get pissed off, honk their horn and pass (thank God) and seem to not understand! Do they not realize they are blinding the driver? Not to mention the oncoming lights such as these! These lights need to be banned immediately!

B.64 December 7, 2016 — Chicago, IL

Can we speed this up, I'm 29 and am loosing eyesight by the minute. How dumb are these people allowing this to happen? Fucking idiots, total argument against Darwinism, we're getting dumber

B.65 December 11, 2016 — Bon Air, AL

In German, would call people who use LED lights, slightly evolved monkeys. Blue light rays, high frequency rays are damaging. And as humans, we're drawn to look at them, so its for sure bad

B.66 December 11, 2016 — Burns, TN

I have to drive to work and see this bullshit every morning,

B.67 December 11, 2016 — Chicago, IL

I'm signing because I don't want one blinding ray hitting my eye, every night, for 362 nights for the next 20 years until I prematurely go blind. Shall we take all the odd farts in congress and shine bright lights in their eyes and just do it, for a full year, great test. Chicago is about to put these in

neighborhoods....mostly because Rahm Emmanuel is retard who runs a bankrupt city, yet throws dinner parties like he's celebrity. #Political Career should be over

B.68 December 11, 2016 — Chicago, IL

Politicians who vote for LED's because of lobbyist, should be stuck by lighting and fed to sharks.

B.69 December 11, 2016 — Chicago, IL

Because they're fucking stupid

B.70 December 11, 2016 — Chicago, IL

How has the goal changed from 200 to 500? joke?

B.71 December 11, 2016 — Idaho, CT

This is getting ridiculous

B.72 December 11, 2016 — Indianapolis, IN

How has this not passed yet? Come on 11 more signatures! And how have SNL not mocked LED lights yet either? Am I the only one that wants to drive around with a baseball bat and blow out every Nissan Truck's LED lights that blind people as they drive. Baby Boomers, trying to run the world, can't figure out how to not blind people. Just retire already!

B.73 December 11, 2016 — Indianapolis, IN

I have children, and driving is becoming more difficult, and I'm worried for their safety if I get blinded by these things and crash

B.74 December 11, 2016 — NYC, NY

We stare at computers all day admitting blue light, now we have them on cars as we drive home. May as well just shoot us now and gives us some poison while your at it. Thanks America, not

B.75 December 11, 2016 — Oakland, CA

Fuck you congress.

B.76 December 11, 2016 — Pipe Creek, TX

These are blinding!

B.77 December 11, 2016 — San Antonio, TX

America sucks

B.78 December 11, 2016 — Wichita, KS

I'm signing because its better than throwing the users of LED lights in the gas chamber

B.79 December 13, 2016 — Ashland, VA

They blind me and cause headaches! It is not only oncoming, when these headlights are behind me, they are just as blinding no matter how I adjust my mirrors! And do not think about replacing them with the proposed laser! Why cant we just go back to past headlights! They did not cost as much to replace either! The new headlights are a danger!

B.80 December 14, 2016 — Chicago, IL

Years ago I spoke with NHTSA regarding this very issue, including advising them that the already noted increase in fatalities was likely due to these unregulated lights. Now they care? When I talked to them they said "a lot of people will need to die" before they act at all on this issue. Fools and sociopaths. Read my articles below. NOTE that limiting light emitted to that of traffic signals is a very bad idea as our traffic signals are also blindingly glaring and those are the ones placed by IDOT (IL DOT). Dr. Coleman https://sliceiconic.com/2015/01/26/led-lights-dangerous-on-roadways-and-off/ https://sliceiconic.com/2016/03/29/blinding-headlights/

B.81 December 24, 2016 — Exton, PA

I have excellent vision, but since about 2-years ago, I have had hot pain when cars with those horribly bright lights are near. Driving at night now takes longer, because I simply pull off the road to wait until vehicles with such painfully bright lights pass me. How can drivers with these lights not know the dangers these lights pose?! If you are behind another vehicles, you NEVER need to have high beam lights on. I have been dreaming of a light up sign that says. Get off my bumper with high beams on! This is a huge danger and I refuse to have "high beam bullies" run me off the road! I am serious about my child's safety! The government is supposed to be for the people and of the people. Let's tell them that regulation of these terrible lights is necessary!

B.82 December 31, 2016 — Mechanicsburg, PA

I cant say enough against headlight use during the day. It is no wonder fatalities have increased when ignorant motorists make it painful to keep your eyes on the road. I refer to it as a visual equivalent of nails on a chalk board. I have unfortunately had to learn to drive looking out the passenger window. Stop . . . Please, stop.

Comments left in 2017

January 2017

B.83 January 4, 2017 — st joseph, MO

I was blinded by the LED headlights and ran off a two lane Highway. In Missouri the pickup trucks seem to be having a competition to see who has the brightest headlights.

B.84 January 10, 2017 — Jamaica, NY

It is very strange that the U.S. government, which did so much to legislate better vehicle safety over the years, nowadays seems to ignore one of the biggest driving hazards--those insanely bright LED and HID headlights!! For anyone driving at night, these lights are a nightmare to deal with. When these first came out, the designers thought they were helping things by brightening the driver's field of vision--mostly a superfluous concern because the older headlights were more than adequate for most driving conditions--and drivers had beams anyway for the darkest conditions, and could get fog lights too. But is is totally unnecessary--and actually harmful--to have these ultra bright lights ON ALL THE TIME. What has been totally neglected is the safety consequences for the other drivers that are forced to look into the lights!! The alleged benefits of increased brightness of the road ahead is negated by the blindness these lights are causing other drivers. Especially at night, driving on a highway or busy road has become hell--not only because of oncoming vehicles with these lights but because of vehicles in back of me. These lights shine right into my mirrors and I can't properly see because the reflection blinds me. I often drive with my left hand shielding my eyes and the other on the wheel!! These ultra-bright headlights are a definite and severe safety hazard and need to be banned--soon, once and for all.

B.85 January 12, 2017 — Pinedale, WY

Headlights are so bright now that even looking away toward the shoulder makes it almost impossible to see in oncoming traffic. I have to slow down almost to a stop until the car goes by before i can continue. it is ridiculous

B.86 January 14, 2017 — Indianapolis, IN

too hard on eyes

B.87 January 14, 2017 — Munfordville, KY

I am not bothered by normal headlights at night but the first time I saw LED headlights I thought I

B.88 January 16, 2017 — Hollywood, FL

I'm tired to seeing blinding headlights that put our lives at risk.

B.89 January 18, 2017 — Chicago, IL

These lights are a misery to other drivers. They are completely over the top too bright, glaring and painful to look at. Ban them! Please!

B.90 January 21, 2017 — Fullerton, CA

These headlights cause headaches for both me and my fiancée. We always have to darken the rearview mirror or change lanes when they′re behind us at night.

B.91 January 24, 2017 — Richfield Springs, NY

I have been blinded by the glare of LED headlights. Their intensity needs better regulation

February 2017

B.92 February 11, 2017 — University Place, WA

I don′t wanna go blind!

B.93 February 12, 2017 — Fairfax, WA

I thought it was against the law to drive with high beams on.

B.94 February 25, 2017 — Teddington, Middx, ENG, United Kingdom

Blinding White LED lights on vehicles are a lethal hazard and should be banned forthwith! :(

March 2017

B.95 March 22, 2017 — Blagdon, ENG, United Kingdom

I am signing because this is a world wide problem and we have to wake up and do something about it.

B.96 March 24, 2017 — Mentor, OH

I stopped driving at night, due to glare, missed out on many club meetings, had to leave xmas and thanksgiving visits before dark, affects my ability to drive all winter when sun sets early. Couldn′t see lady walking dog on side of road one night, this is definitely a health hazard for people of all ages. No need for these types of lamps. Please ban them, before they existed we managed without them for over one hundred years.

B.97 March 26, 2017 — Thingwall, ENG, United Kingdom

Glare from these blinding headlights make it difficult to focus on the road. They are painful to the eye and completely unnecessary.

B.98 March 26, 2017 — Wayne, PA

These annoying headlights are blinding. I have migraines and they make them 1000x worse!! Please get these headlights removed from the market!!

B.99 March 28, 2017 — Glasgow, SCT, United Kingdom

I′m signing this petition because these headlights are blinding and dangerous. I would like the UK government to ban them too and perhaps if this petition is successful the government of the U.K. will take some action too. Please sign, especially those with LUPUS who are light sensitive - see the article in NEWS AND VIEWS, Spring 2017.

April 2017

B.100 April 20, 2017 — Aberdaron, WLS, United Kingdom

These headlights are killing people

B.101 April 24, 2017 — Princeton Junction, NJ

This is one case where signing this petition (to me) is unquestionably the right thing to do!

May 2017

B.102 May 2, 2017 — Den Dolder NL, Netherlands

I sufer myself and find many siuations where I know to be unsafe because of this.

B.103 May 2, 2017 — Fetcham, ENG, United Kingdom

I am often blinded by bright headlights. It's putting me off driving at night.

B.104 May 3, 2017 — Canterbury, ENG, United Kingdom

I believe new legislation is required to control acceptable levels of vehicle lighting on today's roads. This includes all motor vehicles as well as cycles and other road users ,

B.105 May 3, 2017 — Downhead Park, ENG, United Kingdom

There is such a chronically diverse range of headlight colours, brilliance, degrees of glare and intensity on cars on the road today, they are becoming a danger to all road users. Therefore, it is imperative that these concerns are addressed and the manufacturers should not be able to dictate the terms, purely as some sales gimmick to attract potential buyers. Lights can and are, frequently, used aggressively, wilfully and to deliberately intimidate. There, almost, seems to be a quite bizarre mentality that makes and turns the brightness and intensity of car lights into some type of prestige and status. "My lights are bigger and brighter than yours, so get out of my way"!

B.106 May 3, 2017 — Somers, NY

Thank you for starting this petition! The bright white headlights are awful whether oncoming or in your rear view mirror.

B.107 May 3, 2017 — Somerset, NJ

They're blinding. And makes me drive slower because at times I can't see the road. Worse during the rain. Yeah good for the driver using it.. BAD & extremely dangerous for the defenseless on coming traffic. Headlights were just fine years ago when you can define an on coming vehicle instead of driving in fear at times. before these detracting and dangerous lights.

B.108 May 4, 2017 — Alhambra, CA

I cant stand driving and all you see coming or behind you blue tinted lights! These lights make it extremely hard to see the road at night

B.109 May 4, 2017 — Carson, CA

It's so hard to drive at night when you have these bright headlights behide you or even on the frwy the opposite traffic headlights...those brights lights make me turn my head or close my eyes...or i get such a glare i can't see and have to break to make sure im not gonna crash into the person in front of me!

B.110 May 4, 2017 — Chino Hills, CA

I'm tired of being blinded by LED Headlights. Please pass this ban.

B.111 May 4, 2017 — Fontana, CA

These are blinding and trigger my migraines. No lights should be so bright as to cause a person to feel tortured

B.112 May 4, 2017 — La Habra, CA

I'm tired of being blinded when I drive at night

B.113 May 4, 2017 — Lancaster, CA

These lights are dangerous and blinding

B.114 May 4, 2017 — Los Alamitos, CA

Thank you for starting this petition. My husband and I we find it hard to drive at night because of the new glaring headlights. It is an obstacle especially for aging eyes. We were wondering how this could be allowed. I stopped driving at night. This means no shopping. I wonder how many people like me are impacting the economy in such way because of these glaring headlights. Regular headlights do not bother me.

B.115 May 4, 2017 — Los Angeles, CA

The LED lights blind me, and are unsafe to other drivers

B.116 May 4, 2017 — Middletown, NJ

Those LED lights are blinding!!! They need to be outlawed!!!

B.117 May 4, 2017 — Santa Ana, CA

Rather than making night driving safer, brighter headlights encourage drivers to drive even faster! In California, the maximum speed limit is considered by many to be the minimum.

B.118 May 4, 2017 — Spring Hill, FL

They r blinding

B.119 May 4, 2017 — Torrance, CA

It's dangerous to blind on-coming cars

B.120 May 4, 2017 — WHITTIER, CA

The new LED headlights are to bright, especially when shining right into a rear-view mirror. I drive a sedan and always have to adjust my mirror when an SUV is behind me with the LED lights because the brightness is overwhelming. It also seems as is the brights are on when a car in on-coming traffic is driving towards me with LED lights. They need to figure out a way to make warm colored LEDs for car and not the bright white, bluish color.

B.121 May 4, 2017 — Whittier, CA

its to hard to see pedestrians so lets save lives!

B.122 May 5, 2017 — Chino, CA

These headlights make it so difficult to drive at night! They are blinding and dangerous. I do not feel safe with these lights on the road.

B.123 May 5, 2017 — Dunsmuir, CA

THE LIGHTS ARE BLINDING and a safety hazard!

B.124 May 5, 2017 — Fernley, NV

It is a dangerous trend.

B.125 May 5, 2017 — Kenilworth, ENG, United Kingdom

In the UK we have exactly the same problem. You have said it all above. I do ask the question what sort of driver, deliberately driver thinks it is safer to drive with lights on reducing visibility.

B.126 May 5, 2017 — Ketchum, ID

Bright headlights are very unsafe for other drivers. Especially where I live, it makes it hard to see other road hazards like wildlife.

B.127 May 5, 2017 — La Mesa, CA

The bright lights force me to turn my eyes away from an oncoming car or, if the car is behind me, I must turn my rear or side mirror away from the lights. Dangerous.

B.128 May 5, 2017 — Las Vegas, NV

Yes, these new LED headlights are a hazard; Especially the ones that have the blue/white toned ones.

B.129 May 5, 2017 — Los Angeles, CA

Yes! These after market headlamps are becoming brighter. There have been times where I'm unable to turn left because the previous oncoming car was so blinding it left spots in my eyes. When it rains the ground becomes a shiny mess, to the point the lines are nearly invisible. And the height standards for the headlamps need to also be accounted for, because if they point straight ahead like an arrow, even the cab of the car ahead is filled with blinding, distracting brightness, making the exterior and the crosswalks hard to view. I don't need to wear glasses, my vision is fine so even wearing glare resistant lenses are not an option.

B.130 May 5, 2017 — Los Angeles, CA
I'm signing because driving while temporarily blinded is dangerous.

B.131 May 5, 2017 — Malvern, PA
These headlights make it difficult to see but almost impossible when it is raining!!!

B.132 May 5, 2017 — Moreno Valley, CA
I commute 65-75 miles one way. I see a lot of cars with blinding headlights and I agree it's dangerous. It's hard to keep eyes on the road when there is so much glare.

B.133 May 5, 2017 — Moreno Valley, CA
I hate the led lights. They make night driving very unsafe.

B.134 May 5, 2017 — Pasadena, CA
As a migraine sufferer this is a HUGE issue for me.

B.135 May 5, 2017 — Rancho Palos Verdes, CA
Very dangerous lighting and causes accidents

B.136 May 5, 2017 — Sun Valley, CA
they are blinding!!

B.137 May 5, 2017 — Trowbridge, ENG, United Kingdom
Too bright and blinding. Also turn indicators set so close to day running lights you cant see them even though they should automatically dim.

B.138 May 5, 2017 — Vallejo, CA
FOOTCANDLES are the measurement of light that comes out of a headlight. Low beam/high beam intensity was established when the modern yellow light headlight was first invented. All new headlights outside these long-established standards are by definition: illegal. What part of "illegal" don't headlight manufacturers understand today? This petition is really unnecessary. Just ENFORCE THE LAW already.

B.139 May 5, 2017 — West Covina, CA
The headlights are too bright and can cause accidents. People use them to bully cars in traffic, also.

B.140 May 6, 2017 — Azusa, CA
It make sense. Typically it takes 30 minutes for eyes to be re-adjusted after being expose to bright light [simple test, how long does it take your eyes to be readjusted after walking into your house from a bright sunny day WITHOUT WEARING SUNGLASSES. There is still no standard for how strong those headlights can be (# of lumins). Although CA vehicle code requires the distance these lights can illuminate, but who's enforcing that? Pull a roller tape out from the police officers back pocket?

B.141 May 6, 2017 — Hendersonville, NC
They are like looking straight at the sun!!

B.142 May 6, 2017 — Murrieta, CA
Those lights blind me!!

B.143 May 6, 2017 — New York, NY
These lights are horrible, and they due cause accidents because drivers and pedestrians are blinded by them.

B.144 May 6, 2017 — Oakland, CA
Can't see in those headlamps! Blinding.

B.145 May 6, 2017 — Pasadena, CA
I've been complaining about this very issue for well over a decade.

B.146 May 6, 2017 — Quail Valley, CA

I can't see when people are driving towards me with those headlights. Then I'm blind for a good 10 seconds after they pass

B.147 May 6, 2017 — Upland, CA

THOSE LIGHTS ARE BLINDING!!! ALMOST GOT INTO SEVERAL ACCIDENTS BECAUSE I WAS BLINDED BY THOSE LED LIGHTS. I HAVE TO WEAR SUNGLASSES AT NIGHT NOW WHEN I DRIVE.

B.148 May 7, 2017 — East Elmhurst, NY

I don't drive but as a passenger, especially a front seat passenger, I find these lights to be blinding, almost hurting my eyes. I can't imagine what it's like to be driving into that glare!

B.149 May 7, 2017 — Evanston, IL

It's dangerous

B.150 May 7, 2017 — Oracle, AZ

These lights are dangerous to other drivers and a source of light pollution.

B.151 May 8, 2017 — Altadena, CA

i AM BOTHERED BY THOSE PAINFULLY BRIGHT ON-COMING HEAD LIGHTS. tHEY ARE A ROAD HAZARD. WHY HAVE THEY BEEN ALLOWED TO BE MANUFACTURED?

B.152 May 8, 2017 — Chino Hills, CA

These lights are dangerous, blinding and irritating.

B.153 May 8, 2017 — Delano, CA

I hope the government listens

B.154 May 8, 2017 — Long Beach, CA

I am tired of being blinded by these dangerously bright headlights.

B.155 May 8, 2017 — Long Beach, CA

The blinding headlights are nothing but a hazard... No way, they need to be that bright.

B.156 May 8, 2017 — Los Angeles, CA

I have a hard time seeing,on,the,road at dark with over bright headlights.

B.157 May 8, 2017 — Los Angeles, CA

The trend of drivers converting their headlights to HID & even just installing 5500K & higher Bulbs to Halogen type headlight housing can be very dangerous to other drivers. The Halogen housing has no filters and the light is spread out too widely over the entire lens causing road glare. Many of the newer cars have projector type housing which limits road glare & auto adjustments as long as it's under 5500K.

B.158 May 8, 2017 — Manhattan Beach, CA

To outlaw high intensity headlights

B.159 May 8, 2017 — Rancho Cucamonga, CA

These lights are too bright and are a hazard they are blinding with oncoming traffic, as well as traffic behind me

B.160 May 8, 2017 — Rancho Palos Verdes, CA

Those bright night lights are blinding and can cause a moment of blinding sight and could result in an accident

B.161 May 8, 2017 — St Augustine, FL

Blinding headlights at night are annoying and dangerous. Too much blue light is also dangerous. Check Harvard Medical School blue light...

B.162 May 8, 2017 — los angeles, CA

Jose Guzman

B.163 May 9, 2017 — Mission Viejo, CA

I'm signing because the HID & LED headlamps are dangerous and annoying. Studies say light above 3000k is bad for your eyes. High intensity headlamps USED to be illegal in California- What happened?

B.164 May 9, 2017 — Redondo beach, CA

I have been a victim of those blinding lights

B.165 May 10, 2017 — Stroudsburg, PA

My eyes are strained by looking into car lights at night.

B.166 May 21, 2017 — Pittsburgh, PA

I feel like my safety is being compromised when people use the extremely bright headlights, and I also living in Pennsylvania, where they have strict window tinting laws on passenger vehicles only, and those laws are unconstitutionally oppressing my safety as a passenger vehicle owner.

B.167 May 22, 2017 — Wethersfield, CT

I'd like to enjoy driving at night again. If I look away from the blinding headlights, I'm distracted. If I look at them, I'm blinded.

B.168 May 23, 2017 — Kendal, United Kingdom

They're dangerous - they are blindingly bright and destroy normal night vision for seconds after passing.

B.169 May 26, 2017 — Enumclaw, WA

I hate these. You cannot see anything with these behind you.

B.170 May 26, 2017 — Huntington Beach, CA

These headlights need to go. Headlights originally were shining forth a beam, now it has flood light appearance which blinds the heck out of you when oncoming

B.171 May 27, 2017 — Burbank, CA

I have been against these absolutely stupid lights since they first came out. I get black spots in my eyes from them as if a flashbulb went off. Not good for driving at all! Who was stupid enough to approve these?!

B.172 May 28, 2017 — Everett, WA

As a person who is hypersensitive to lights and knowing many others as well also affected, these are very dangerous and can cause side effects that last hours if not more, even to those who are not hypersensitive.

B.173 May 28, 2017 — Saint Robert, MO

I am blinded on the road by these types of headlights.

B.174 May 28, 2017 — West Sayville, NY

I cannot see when these super bright lights are approaching me! They should be illegal because at the very least it is distracting and forces me to look away. At that point I've lost track of oncoming traffic or a road hazard.

B.175 May 29, 2017 — Hollis, NY

Even for non-drivers the lights are visually painful as well as obscuring. I have problems in my eyes as it is and I do not need to have another issue with my eyes because of these lights that sometimes I think are high beams. Whoever thought these were 'SAFE' on the roads seriously had no clue. Get rid of them or tone them down. Thank you.

June 2017

B.176 June 4, 2017 — Crystal Lake, IL

I have been temporarily blinded by the led headlights

B.177 June 4, 2017 — market harborough, leicestershire., ENG, United Kingdom

I want to drive in safety like I used to be able to, particularly at night-time. I've had to give driving after dark!

B.178 June 6, 2017 — Coral Springs, FL

Thank you for starting this petition! These headlights annoy this sh*t out of me!..Everytime someone gets behind me driving with these bright LED lights, I feel like having a extremely bright light in back of my car to shine in their eyes so they know what they're submitting drivers to! Thank you for starting this..I hope we can get the DOT to look into this.

B.179 June 13, 2017 — Canberra, Australia

Same for me. It's like a catch 22. I am forced to view traffic situations indirectly, which is potentially dangerous. Never had a problem in 30 years of driving, and then almost suddenly this crazy escalation in glare virtually every on the road.

B.180 June 14, 2017 — Australia

Lights on vehicles, and elsewhere, have, generally speaking, become WAY too bright in recent years, as regards both comfort and safety. This is a worldwide phenomenon which is largely out of control and urgently needs to be addressed.

B.181 June 14, 2017 — Oakland, CA

Bright lights are an obvious safety issue with a simple solution. I rarely drive at night in places where there is moderate to heavy traffic because the lights make it difficult to see.

B.182 June 15, 2017 — Harrison, AR

As someone who has some severe migraines, I almost desperately want these high intensity lights off the roads. They make the roads more dangerous, not safer.

B.183 June 16, 2017 — Long Ashton, ENG, United Kingdom

I DRIVE AND TOTALLY AGREE WITH THIS PETITION.GOOD LUCK.

B.184 June 18, 2017 — Mount Pocono, PA

In addition, all LED emergency lights on law enforcement and first responder vehicles need to banned, especially roof mounted emergency lights. They blind motorist, pedestrians, cyclists, and emergency responders, including law enforcement officers. Federal and State laws require motorists to move over while approaching an emergency zone or traffic stop, but it cannot be safely performed if being blinded by LED emergency lights. Even first responders and law complain of being blinded by their own vehicle's LED emergency lights.

B.185 June 19, 2017 — Clear Lake, WI

Todays' halogen headlights are bright enough. LEDs and those blue Xexons should be BANNED! Along with foglights and all headlight type Daytime Running Lights (except motorcycles). Only the "Amber" DRLs should be allowed on cars, trucks, and buses, not headlights.

B.186 June 28, 2017 — Devon, ENG, United Kingdom

When driving towards cars with HID lights it is like driving towards a vehicle with main beam on. With these lights I have to look to the side of the road. DAMNED DANGEROUS!!! and uncalled for. If you need lights that bright to see further ahead, you are driving too fast, (I'm no slouch).

July 2017

B.187 July 2, 2017 — Flint, MI

These lights are bothersome when i drive at night. Some what blinding at times.

B.188 July 4, 2017 — Dunedin, New Zealand
Safer lighting is needed.

B.189 July 4, 2017 — Dunedin, New Zealand
Hazardous, harmful and unacceptable, especially when there are safer alternatives.

B.190 July 5, 2017 — Dunedin, New Zealand
It's just to hard to see when there's oncoming traffic abs then for your eye's to adjust after

B.191 July 5, 2017 — Italy
cause I do not like blinding headlights, it is dangerous and cause discomfort especially LED lighting

B.192 July 8, 2017 — Fairport, NY
My friends and I do not drive at night if it can be avoided. Ages. 35 to 55

B.193 July 10, 2017 — Fredericksburg, VA
No one should be blinded by someone else's headlights at night while trying to drive. When I go out anymore at night I have to wear tinted clipons over my glasses in order for me to be able to see properly. When it snows it rains it makes it much worse! We all need to be more safety conscience!

B.194 July 17, 2017 — Ilsan, South Korea
Ban Blinding Headlights and Save Lives!

B.195 July 18, 2017 — Shawnee, MO
I was in an accident where the blue headlights on one vehicle caused another driver to cross the median, sides wiping my car

B.196 July 19, 2017 — Los Angeles, CA
LED headlights are incredibly bright and can be blinding, including in sideview mirrors. LED taillights can also be hazardous.

B.197 July 20, 2017 — Somerdale, NJ
Yes, please ban these lights. Much too bright at night. Also they really are an irritant during the day. A bright light coming towards you when it is already sunny is quite the distraction and we don't need move distractions while driving. It is dangerous enough. That split second of distraction can cause an accident. Also a problem with cars behind you as well. Turn off the lights during the day, please.

B.198 July 26, 2017 — Horseheads, NY
It's not safe for us it necessary to have these blinding lights on cars....the roads are unsafe as it is.....stop the lights

B.199 July 26, 2017 — Rochester, NH
I can't drive at night anymore. The blinding lights in front of and behind distract and make it impossible to navigate my vehicle. My eyes are overwhelmed even if I try to look away.

B.200 July 26, 2017 — Stamford, NY
These abusive auto lights must be banned asap while we still have some peace of mind on our public highways. Please spread the word on these and donate to our just cause! Thanks again Donald.

B.201 July 30, 2017 — Beddau, WLS, United Kingdom
I suffer chronic migraines and bi polar which is severely affected by these lights.

August 2017

B.202 August 1, 2017 — Olathe, MO
I am so blinded and feel roadrage toward oncoming cars with bright lights behind or in front of me.

B.203 August 3, 2017 — San Angelo, TX
Hurts my eyes!

B.204 August 8, 2017 — Alamogordo, NM

The new daytime headlights are way too bright!!!! Correct beaming of headlights would make a big difference!

B.205 August 8, 2017 — Brooklyn, NY

Many times I've narrowly avoided going off the road or driving into oncoming traffic because I was blinded by blinding LED headlights. These lights are endangering everyone on the road and should be banned.

B.206 August 10, 2017 — Albany, NY

It dangerous to drive blinded. I turn all mirrors down/away when driving at night, and look away when passing.

B.207 August 10, 2017 — Albany, NY

Audi and Volkswagon headlights are especially nazi.

B.208 August 16, 2017 — Orderville, UT

The blue lights not only cause an instant headache but also induce vomiting and the bright leds cause temporary blindness.

B.209 August 17, 2017 — Ottawa, ON, Canada

It's true and very distracting. Needs to be regulated

B.210 August 18, 2017 — Corona, CA

Blinding tail lights on most new vehicles and big rigs can impair your vision even at a distance and are brighter than stop lights. News media should be involved in the subject. Auto manufacturers and departments responsible for driver safety do not seem to be driving and noticing the problem. Some service stations have blinding LED price sign that you cannot distinguish the numbers

B.211 August 19, 2017 — Danielsville, GA

I'm tired of being blinded on major highways and/or interstates.

B.212 August 20, 2017 — Australia

I'm hoping this will bring change across the world, because they too have arrived in Australia! First I thought it was high beams, but the sheer amount of cars with these glare emitting lights have increased significantly. It's completely unsafe, as a frequent driver at night, oncoming vehicles with these lights blind me, like a camera flash ... I have to squint and slow down my driving. If it's a car behind me, I fear changing lanes because my side view mirrors are completely useless as all I see is glaring white light and I can't see the other lanes. So unsafe! Also, the light emitting from them hurt my eyes. If my body is hurting from this, when previous halogen lights did not, then I know this is not right and not OK!

B.213 August 23, 2017 — Fairfax, WA

I am literally blinded by the light! Turn down those high beams. Seriously. If your eyesight is that bad, you shouldn't be driving at night!

B.214 August 25, 2017 — Virginia Beach, VA

I have autism, and am already extremely sensitive, especially to lights (some can give me migraines-bright LED xmas ones are a hazard if I get carried away with Christmas spirit and can't help but look). When someone has their brights on, even during the day, my eyes are still reeling for minutes after. With the new LED blue, purple, etc lights, I can't even look sideways without still being affected. I thought I was alone in how much this sensory overload hampers my good driving. I'm glad to not suffer in silence anymore about lights that took a serious problem for me and made it astronomical.

B.215 August 28, 2017 — Hempstead, NY

I can not say just how dangerous this is, especially for the pedestrian who wears glasses!!!

September 2017

B.216 September 6, 2017 — Bloomfield, NJ

I'm tired of being blinded on the road at night.

B.217 September 6, 2017 — Scottsdale, AZ

i believe in preservation of vision. the laser/tazer from the driverless cars have also blinded me. so did the strobes from the redflex defective photo radar cameras. flashblinding, glare or distraction of a driver or pilot, atlease from laser in arizona, is a class 5 felony.

B.218 September 6, 2017 — Scottsdale, AZ

the led's and rf bulbs are designed to blind, the smartmeters also have sonic and tazer capabilities, the driverless cars invading arizona run on lidar- laser and radar- designed to cause reflected eye injury and blindness.

B.219 September 21, 2017 — Sonoma, CA

I've had to put up a curtain behind my front seats to drive at night because these damn LED lights light up the inside of my car from behind like it's friggin' day light!!!! They need to be BANNED now!

B.220 September 25, 2017 — Dunedin, New Zealand

blue light is classified as a class 2a carcinogen in night shift workers. WHO. White LEDs are rich (30% or more) in blue light, shown to inhibit melatonin and disrupt circadian rhythms. Moonlight affects circadian rhythms in humans how much then will LED streetlights disrupt our biological clock?

B.221 September 26, 2017 — Miami Beach, FL

Very dangerous

B.222 September 26, 2017 — Morganton, NC

I'm absolutely tired of not being able to see the road as these types of lights pass, not to mention, tailgating issues. It causes headaches and spots in my vision, along with anyone else I have conversed with on the subject. We've seen fine for years with old halogens, and I say that's all we need! It's enough to deal with halogen high beams!

B.223 September 27, 2017 — Ludington, MI

This is problematic for me as well.

B.224 September 27, 2017 — New Hudson, MI

Stop the accidents!!!!

October 2017

B.225 October 3, 2017 — United States

I am regularly blinded while driving home at night, especially when I am on my motorcycle. The effect of multiple high intensity headlights from several oncoming cars behind one another is so painful that I have to look off the road to the right, which is almost as bad as driving with my eyes closed. I hope there is a remedy for this problem soon. Thanks

B.226 October 7, 2017 — Birkenhead, ENG, United Kingdom

I really struggle with the brightness of car headlights in the UK, they really make my eyes hurt to look at them. At the age of 37 I am not the only one of my age I know that find them ridiculously bright

B.227 October 18, 2017 — Palo Alto, CA

It is important for this campaign to ban not only the blue/white (LED) headlights but also the white ones with too much luminosity, and also the two lights below headlights that are white and almost as bright as headlights. There are also wreaths of lights around headlights and other candlepower embellishments that apparently appeal to people's egos. They (ego trippers and corporations seeking to indulge them) will fight back with other distracting lighting, including excessive tail lights.

The overall issue of cars being lit up in many distracting ways should be addressed from the beginning.

B.228 October 26, 2017 — Citrus Heights, CA

I have been in too many blinding situations that could have resulted in an accident or worse as of late. Seems allot more cars this year have them then before. I get anxiety close to the end of work knowing I will soon be in traffic. Nowadays it seems every other car has their high-beams on and pointed right in my face. I run a computer repair shop and i am looking at screens all day, so going into what feels like a police search light right in my face is beyond scary and just plain dangerous and disrespectful in too many ways. All HID lighting should be banned on cars in my opinion. If you have to literally put a lighting ballast to amplify power into your headlights then you are purposely trying to blind drivers is my belief. End rant :)

B.229 October 29, 2017 — New York, NY

Coming at you , behind you , if the police knew haw many tickets they can issue for this offense they would be right on it .....!!!!!!

B.230 October 29, 2017 — New York, NY

Is there anyway to go after the manufactures or stores hawking these....

November 2017

B.231 November 11, 2017 — Travelers Rest, SC

HID and LED lights, especially of the blue-ish colour temperature and a public safety hazard. They should be banned. Vehicles that are equipped with them should be required to have them removed, even if they are installed by the factory. why is there not already a standard in-place that restricts the brightness of these lights? HIS lights create a hazard by blinding drivers. They also can be a health hazard by causing damage to the eyes other drivers. Additionally, these lights promote aggressive behaviour and are often used as a weapon against other drivers.

B.232 November 13, 2017 — Grants Pass, OR

I find these lights blinding.

B.233 November 13, 2017 — Poplar Grove, IL

Extraneous lighting, especially in wavelengths shorter than 610 nanometers, has nothing but harmful effects, particularly biological and astronomical.

B.234 November 13, 2017 — Shingletown, CA

They blind me too.

B.235 November 14, 2017 — Soquel, CA

I can't see the road when these things are blaring in my mirrors !

B.236 November 16, 2017 — Columbus, OH

Hate them

B.237 November 16, 2017 — Galloway, OH

I work 50-60 hours a week driving on the road half of those hours are after the sun goes down and then my evening/night is constant blinding, headache, road rage sometimes, frustration and seeing dots for many seconds! It's getting ridiculous this should never ever be ok or legal to us regular citizens! Police I can understand more but when lately all I see is bright bright blinding headlights in front of me and behind me blinding from both directions at same time and also cora buses, fire trucks these are huge trucks 10 times bigger than my small short Toyota Camry! Please stop the use of these for regular civilians please! It's so irritating and so so so very very dangerous every single day after dark hits everyday! Please stop the use of led lights please I'm begging! I'm so scared I will wreck because I'm being blinded by almost every or every other vehicle in front and behind me all the time! This should be immediately taken out of regular vehicles seriously. I know they r nice and cool also last a lot longer yeah that's awesome but is this going to be awesome when it starts to impair drivers

on the road and start dying because they lost control not because drinking or drugs but because the person in front or behind lights are so bright they couldn't see the small dog running out in front of them or the child that ball just rolled out and they run out to get but because your blinding lights are in my eyes I can't see the kid in front of me or the rain combined with led lights make this dangerous situation 100 times worse! It's very dangerous please please stop this please I'm begging

B.238 November 17, 2017 — big flats, NY

LED lights hurt my eyes while driving and should be banned before they cause more accidents. They also cause migraines and should be banned from all lighting. I am personally affected by these lights.

B.239 November 21, 2017 — Tonbridge, ENG, United Kingdom

I hate these dazzling lights with their blue tinge. They may help those driving cars fitted with them to see better what is in front, but they blind the rest of us whether the lights are shining in our faces or into our rear-view mirrors.

B.240 November 22, 2017 — Brooklyn, NY

Driving without seeing is dangerous to me and you!

B.241 November 22, 2017 — Sydney Mines, Canada

These new headlights are blinding in the night time while driving.

B.242 November 23, 2017 — Beaverton, OR

LED street lights and headlights cause dangerous glare and brightness that make driving after dark dangerous. Additionally, individuals with migraine disorders find it difficult to impossible to drive safely at night.

B.243 November 24, 2017 — Bloomfield, NJ

I am TIRED of being BLINDEDby oncoming LED car headlights. It is difficult to see the road in front of me!

B.244 November 24, 2017 — Eau Claire, WI

Sorry to hear ... I signed, hopefully more will too

B.245 November 24, 2017 — Grand Rapids, MI

I agree they are unnecessarily too bright

B.246 November 27, 2017 — Tampa, FL

When I drive at night, I encounter many vehicles that have hid/blue-white headlights that are too bright and cause pain and temporary blindness. I have to hold up my hand to block some of the light. STOP THE PRODUCTION AND INSTALLATION OF THESE TYPES OF LIGHTS

B.247 November 29, 2017 — Vancouver, Canada

I totally agree !! I also started a Petition myself in Canada. I thoroughly read your posting Donald Berry. Thank you for doing this !! We need to keep supporting this and sharing it so that manufacturers stop making these headlights, it causes accidents , casualties and damages peoples eyes. We need this to spread North America wide. If you could please support mine, I in huge support of yours. Blessings to you for doing this !!

December 2017

B.248 December 3, 2017 — Kodak, TN

Night driving continues to get worse. People with fog lights and the brighter LED lights are ruining my eyes. I have friends who also complain. It is so hard to see with those lights coming right at you. I drove 3206 miles in Oct. and over the week had to do night driving. By the end of the trip which was a very long night drive of 8 hours home, my vision was so messed up. It′s been a couple months and driving at night is no fun. The reason for the original yellow cast on the lights was to avoid all of this eye damage we are experiencing. I am sick of it and really hope that something can be done. When I see a car approaching with 4 or 6 lights on the front of their vehicle and there is no fog, it makes me

want to put my headlights on bright so they can endure a little of what I am going through. I hope something will be done soon. Maybe the media needs to get involved to spread the word.

B.249 December 4, 2017 — AZ, United States

They trigger migraines.

B.250 December 4, 2017 — Baldwin, GA

I suffer from chronic daily migraines and I've all but stopped driving at night because of these headlights.

B.251 December 4, 2017 — Booneville, AR

These are blinding and dangerous and are a trigger people with migraine disease!

B.252 December 4, 2017 — Chester, SC

Blue lights causes me to have migranes, and that can be dangerous driving at night.

B.253 December 4, 2017 — Crossville, TN

LED lights are blinding and cause migraines for me and many wrecks! Fog lights are just as bad!

B.254 December 4, 2017 — DeKalb, IL

I get severe migraines and am very sensitive to light.

B.255 December 4, 2017 — Great Falls, MT

I have severe migraine disease and these lights trigger a flare up of my symptoms. It is difficult/dangerous to drive once the symptoms start.

B.256 December 4, 2017 — Hooks, TX

There are many times the brightness and glare blinds me, either being at a single lane two way traffic lanes or easily and most common method from behind. I've flashed the upcoming vehicle from opposite direction assuming their headlights were on "high beam" so they can turn down their headlights. However, I've been flashed back to let me know it is not their "high beam" lights, rather their normal "low beam" lights. I have taught myself to move positions in the seat while driving to avoid headlights from behind to strike me through the rear view mirror, even after have clicked on the rearview mirror's night glare adjustment button below the mirror. Furthermore, many times these LED headlights in vehicles, except older year vehicles (1970, 1980, 1990) have initiative the start of migraine headaches, which is the main reason I avoid or very seldom drive at night time.

B.257 December 4, 2017 — Joanna, SC

I understand that headlights are important for drivers to be able to see at night, and in the rain. However, extra bright lights make it harder for other drivers to be able to see, making the roads more dangerous for everyone. They can also be a trigger for migraines in some people. When a migraine is triggered, it often affects vision and reaction tome, and is frequently excruciating. Extra bright lights can cause accidents, which can result in serious injuries, or even death. Regular headlights should be sufficient for all drivers.

B.258 December 4, 2017 — Las Vegas, NV

I suffer from migraines and these lights give me an instant migraine.

B.259 December 4, 2017 — Lockbourne, OH

These lights are a hazard to others on the road.

B.260 December 4, 2017 — Los Angeles, CA

I suffer from photophobia and it triggers debilitating migraines that last for days! I also have to drive at night as a courier since my migraines prevent me from having a full-time job doing my regular work. In confronted with these blinding lights each night and have to wear special glasses in order to survive them! But even with the glasses on, the lights are still too bright. It's awful. Please do something about this problem. Thank you.

B.261 December 4, 2017 — Maynardville, TN

Because I have Multiple Sclerosis and since losing my sight then regaining that ability after the passing of an exacerbation years ago I have had a very difficult time driving at nighttime as well as at “twilight”. The lights used now are horrific and do cause me instant migraine if in face of them! Please call for discontinue use of these types of ultra bright lights even at lowest setting!

B.262 December 4, 2017 — Monaca, PA

I have migraines and blue light is a major trigger for them.

B.263 December 4, 2017 — pittston, PA

I suffer from migraines and driving home from work is difficult even eith night driving glasses.

B.264 December 5, 2017 — Coventry, RI

For the longest time, I thought it was just me. This problem affects all age groups. Sometimes I turn my eyes to the right to avoid oncoming 'spotlights.' When the bright lights are behind me, if I turn the side mirrors to just the right angle, the reflected light goes back to the person behind me and they back off. In slow-moving, bright traffic I use my left hand to shield my eyes. None of this should be necessary. Last evening, I flashed my hi-beams at a truck, and he turned on the light-bar rack that was on the roof of the cab. Is this a Mine-are-brighter-than-yours contest? There needs to be a limit to how many lights can be on a vehicle, and how bright those lights can be.

B.265 December 5, 2017 — Galena, KS

I get migraines easily and these headlights do not help.

B.266 December 5, 2017 — Ironton, OH

I want to help save more lives

B.267 December 5, 2017 — Patriot, OH

I would love to see them ban these new lights had some idiots run me off the road cause they seem to want to ride my bumper with these lights in my eyes and I couldn’t see my turn for them being so blinding!! I think the real reasons for them to have these lights they are also using them in poaching cases !!! ☒

B.268 December 5, 2017 — Portland, OR

These lights give me a migraine near immediately and blind drivers on the road. It's known blue light has negative effects for parts of the population.

B.269 December 6, 2017 — Buffalo, NY

You got to be kidding me!!It will most had 10 accidents because of this!!!!

B.270 December 6, 2017 — Garforth, ENG, United Kingdom

I find these high intensity lights dangerous and annoying. I believe they are on a par with main beam headlights of old. There is no need for them. On poorly lit roads there is main beam to use. I did a test on a lit motorway with no other traffic around and turned my lights OFF, I couldn't tell i'd turned them off. So in other words on lit roads there's no need for these eye ball melting headlights. These high intensity lights on today's cars are a marketing gimmick and a dangerous one at that. I believe people are driving around now, who don't have these high intensity lights fitted in their cars, with main beam on because they think it's ok to do so. Standards are dropping all the time, in fact, they've gone.

B.271 December 6, 2017 — Klamath Falls, OR

They have always caused issues for me and my husband

B.272 December 7, 2017 — Federal Way, WA

I tried everything i even put my high beems on them and its bad living in kent washington and federalway area. These drivers dont have respect at all i think it the older people who be driving at night in their 60s and above thinking they are young. They should have a age cut off limit on elderly

peopleover the age 50 and above shouldnt have a licsense period and people who uses their high beems should get a ticket no matter what and have their lic taken on the spot.

B.273 December 7, 2017 — University Place, WA

This is important because... https://m.facebook.com/Ban-LED-and-other-blinding-headlights-1246601765483383/?ref_component=mbasic_bookmark&ref_page=XMenuController&ref=opera_speed_dial

B.274 December 8, 2017 — United States

Recently I've had many cars flashing their brights at me in my bicycle. MY BICYCLE LIGHT IS DISTRACTING DRIVERS. Hilarious and unfortunate.

B.275 December 8, 2017 — des plaines, IL

Yes get rid of them

B.276 December 11, 2017 — Lake Station, IN

Its super annoying and is worsened if you wear glasses.

B.277 December 11, 2017 — Valparaiso, IN

This is important because many accidents could and have happened with blinding headlights. very annoying and very bright.

B.278 December 11, 2017 — Valparaiso, IN

this is very important to me because this is a dangerous to be driving with peoples car who have very bright lights. they are very annoying and and to bright and a detraction to all drivers. the should not be loud on the road. they need to change them to a normal light that's not detracting.

B.279 December 12, 2017 — Novi, MI

Have seen accident happen because of bright flashing lites on police car.

B.280 December 14, 2017 — Baglan, NPT, WLS, United Kingdom

These new LED headlights are horrendous for drivers with any kind of light sensitivity, and probably not great for anyone. I literally put my hand in front of my eyes when a car with these lights approach. Instinctive reflex to protect my eyes, highly dangerous when driving!

B.281 December 14, 2017 — Lexington, SC

These LED headlights on new vehicles and the aftermarket head lights also the LED strobes on emergency vehicles and utility vehicles are way to bright and blinding they do more harm than good. All mentioned above are a distraction to on coming drivers.

B.282 December 16, 2017 — Kalkaska, MI

I have personally had issue with blinding headlights from oncoming vehicles.

B.283 December 17, 2017 — Huntington, NY

It's an issue of safety. If it will save lives or simply make driving at night easier for people, then let's make that change.

B.284 December 17, 2017 — Los Angeles, CA

It is dangerous and really disturbs my eyes trying to drive.

B.285 December 17, 2017 — Madison, WI

i am carolyn justice and i am from boiling s.c. may GOD BLESS YA .from MEMAW. NOTsure of what i am looking at

B.286 December 19, 2017 — Romford, ENG, United Kingdom

I almost had an accident because of these headlights , they are blinding and you cannot see in front of you when a car is oncoming , please ban them

B.287 December 21, 2017 — Biggin Hill, Kent. England, British Indian Ocean Territory

Good luck, keep up the good work. https://www.causes.com/causes/793537-ban-drl-s-all-automatic-car-lights

B.288 December 22, 2017 — Chicago, IL

Thanks Auto Industry...you have ruined being outside at all. I despise your blinding headlights. Join our group to raise awareness and to ban these horrible LED lights. https://www.facebook.com/groups/155084901640186/

B.289 December 22, 2017 — Minneapolis, MN

I get migraines from these horrible lights. They make driving unsafe due to temporary blindness!

B.290 December 22, 2017 — N14 4XR, ENG, United Kingdom

There are more and more of these lights and I find them unbearable. I don't have a problem with the lights on older cars. The daytime lights become quite horrible if the driver omits to turn on the headlights when it gets dark and these tiny glaring lights become more intense. Something should be done to regulate car (and street) lights, which are now also being changed to LEDs and which cause bright spots on one's peripheral vision and provide light which does not spread causing dark areas. Something must be done about this. I know someone who had an accident caused by being dazzled by a car coming over a humped crossing towards her.

B.291 December 22, 2017 — Tacoma, WA

I've almost had accidents because of these intensely blinding headlights. They should be banned and removed from the market.

B.292 December 23, 2017 — Burnley, ENG, United Kingdom

I am dazzled by these blinding lights on a daily basis. I totally agree with Donald. There is also a new trend amongst cyclists to have similar blinding LED lamps that flash or strobe. These too are a source of distraction and increase the already dazzling amount light being aimed at drivers too regularly.

B.293 December 23, 2017 — Dorchester, ENG, United Kingdom

This needs to happen in Europe as well.

B.294 December 23, 2017 — Lansing, MI

These lights are insane! For glasses bearing people it’s creates an undeniable glare!

B.295 December 24, 2017 — Brent, United Kingdom

I have experienced being nearly blinded by these lights and realise they are a hazard

B.296 December 29, 2017 — Yangu, South Korea

What is the purpose of lighting ? If you think that lighting is for energy saving, it's better to turn off.

B.297 December 30, 2017 — Queens, NY

These lights are ridicoulusly dangerous. Great job consumer safety for the automobile industry. Great job. lol smh

B.298 December 31, 2017 — OH, United States

HID and other high intensity headlights need some serious regulating (such as Australia's Design Rules). Many auto mfgs now have HIDS stock in their new vehicles. They cause annoyance from vehicles behind you, which is not only dangerous, it is also a severe annoyance which can be dangerously distracting and lead to even more dangerous road rage. In addition to this they often appear brighter than "Hi-Beams" and are a very severe safety concern.

Comments left in 2018

January 2018

B.299 January 1, 2018 — Bowdon, ENG, United Kingdom

This is an example of light pollution which is a major threat to the environment.

B.300 January 1, 2018 — Seattle, WA

Being blinded by headlights is dangerous.

B.301 January 2, 2018 — Bklyn, NY

They are blinding to everyone sitting up front in a car. I don't want to die from something that can be prevented.

B.302 January 2, 2018 — Lawrence Township, NJ

These light hurt my eyes

B.303 January 2, 2018 — Longmont, CO

I am definitely having issues driving at night. The lights of many oncoming cars are so blinding i am actually taking strange and possible dangerous steps to be able to drive. Sometimes i put my left hand up or look mostly to the right. This really prevents me from seeing anything to the left. I also have to slow down because i cannot there see the lines on the road or if there are any issues ahead whete i might need to take preventive measures. Please ban these extremely bright lights.

B.304 January 2, 2018 — Washington, NJ

These lights cause accidents from their blinding glare.

B.305 January 2, 2018 — Westhaven-Moonstone, CA

These need to be outlawed

B.306 January 2, 2018 — langhorne, PA

Signing because headlight glare is becoming more of an issue with the addition of high intensity headlights.

B.307 January 3, 2018 — Liverpool, ENG, United Kingdom

i love astronomy and light pollution spoils it

B.308 January 3, 2018 — Malvern, PA

Can't tell the difference between oncoming brights and hi-intensity headlights anymore. They are definitely problematic.

B.309 January 4, 2018 — Cambridge, MN

Wayy to bright

B.310 January 6, 2018 — DOBBS FERRY, NY

I'm a total gearhead and love all things "car", and I have never understood why these lights are legal. They're totally blinding and potentially dangerous for everybody on the road except the person using them. Since when are halogen lights NOT good enough?

B.311 January 11, 2018 — United States

I have personally been blinded by these overly bright lights and I think that they should be discontinued.

B.312 January 12, 2018 — Smithfield, PA

I am blinded every morning on my way to work to a stop. I can see the vehicle coming 2 minutes before I can actually see the vehicle... who needs lights this bright??

B.313 January 15, 2018 — Hawthorne, NJ

I have been forced from my job by LED lighting and now struggle just to drive. I can see just fine with my halogen headlights, incandescent flashlight and incandescent lighting in my home but the LEDs give me an instant headache, brain fog and eye strain. Even Apple acknowledged the problem with LED lighting by giving a "Night Shift" mode to the iOS devices that tints the display to a warmer yellow tone. We have laws against distracted driving due to cell phones but they allow LED / HID / Focused Beam headlights, LED taillights, LED brakelights (especially the ones that pulse on emergency vehicles), LED light bars (sold for off-road use but still used on-road) and LED emergency vehicle lights that are even more blinding than the headlights! I used to enjoy driving at night and didn't mind working the night shift; then LED lighting ruined my life. Put SAFETY FIRST! Completely ban and outlaw LED lighting on vehicles and anywhere where drivers on roadways will be affected by them.

B.314 January 15, 2018 — Sunland, CA

These lights are extremely dangerous, especially when driving through tall hills

B.315 January 16, 2018 — Dededo, Guam

Also blinding when they're tail gating you

B.316 January 17, 2018 — Des Moines, WA

They sure impact my eyes badly. I have to put my hand up to block them when driving at night. Not good!

B.317 January 17, 2018 — Woodland Hills, CA

This must happen. Some models low beams (eg. Cadillac Escalade) are brighter than the high beams on most cars.

B.318 January 23, 2018 — AL, United States

They are extremely unsafe especially when tractor trailers have them. Most people that have them that I know laugh and think it's funny. It's dangerous.

B.319 January 23, 2018 — gaithersburg, MD

PLEASE BAN THESE BLINDING LIGHTS ON CARS! They are lethal!

B.320 January 23, 2018 — germantown, MD

It is extremely difficult to see at night while being bombarded with these headlights. The lighting used by crews doing road repairs is also blinding.

B.321 January 25, 2018 — Bloomfield, NJ

The situation is intolerable. Driving was once my expression of freedom but with the blinding headlights coming at me and if not coming at me, bouncing into my rear view mirror. I have to shift my eyes from the glare which makes me unable to see pedestrians. Street driving after dusk is more anxiety producing than highway and highway is terrible. It feels like people have thier brights on all the time at night.

B.322 January 25, 2018 — Chicago, IL

I find them difficult on the eyes, they are blinding and hurt sensitive eyes. Obnoxious!

B.323 January 28, 2018 — Falfurrias, TX

This has to be fixed-new car low beams are brighter than my high beams. Another great example of stupidity beating out logical safety.

B.324 January 28, 2018 — Portland, OR

I am so tired of putting up with having to decide if whatever I need to do after dark is worth a 2 day headache or puking! Especially since the city of portland Oregon in its infinite stupidity put up led streetlights. It's REALLY scary trying to drive here! You can't see pedestrians, the blinding effect of the headlights odds much worse, and to top it all off... The police cars and buses are the most

blinding... I've had to stop in the middle of the street because I can't see too even pull off to the side! How many young people have to start turning up with cataracts before something is done?!

B.325 January 30, 2018 — Gray Creek, Canada

LED and Zion lights were designed by technology to be brighter, BUT OUR EYE BALLS ARE STILL THE SAME.

February 2018

B.326 February 4, 2018 — Albany, MO

I've created a Facebook group called LED's:The Sun of Hell, because of this blinding, hellish light. I have done extensive research, the AMA recommends streetlights be shielded and below 3,000 Kelvins. Headlights cannot be shielded, and they are often twice the AMA recommendation regarding Kelvins. We are being subjected to criminally dangerous ignorance by city officials, building managers, and the automobile industry regarding these lights. The reason for them, energy savings, is also being negated by increasing the number of fixtures, even rural outbuilding are festooned with them, mounted horizontally to blind passing drivers.

B.327 February 5, 2018 — Bournemouth, ENG, United Kingdom

Headlights are too bright. They are becoming a safety hazard.

B.328 February 9, 2018 — Atlanta, GA

There seem to be more and more cars with these headlights on the road, so much so, that my eyes can't seem to get a break in between the glare of oncoming traffic. Even looking away doesn't seem to help so I have to put my hand up to shield my eyes or I will have spots in my field of vision for a few seconds. I am driving a car mind you and those few seconds could mean the world of difference. I choose not to text or talk on the phone while I am driving because I don't want to be distracted but these HID and LED headlights are creating just as much a distraction. Maybe the headlights pass the intensity (Lumens) test however there don't seem to be any regulations regarding wavelength of the headlamps. Maybe that is what needs to be updated? In the meantime, the HID and LED lamps need to be banned for the safety of all those on the road!!

B.329 February 15, 2018 — Fountaintown, IN

These lights are blinding me every time I drive at night. For anyone who have a difficult time driving at night, these only amplify the problem. These need to be banned immediately!!

B.330 February 19, 2018 — Makawao, HI

hideous blinding lights, last thing we need to have blarring in our eyes while driving!!!

B.331 February 21, 2018 — Onsted, MI

These lights are blinding, especially at night. I have to turn my mirrors down and have to shield my eyes to oncoming traffic. It is dangerous.

B.332 February 21, 2018 — swansea, MA

Worst LED lights ever ,like they need it ? My biggest fear is the road construction on those police cars (holy god) !!! I was totally blinded on the highway! Yikes I was pissed because it took me eyes FOREVER to be back to the normal sighting visions! Not a good move whoever created LED on vehicles! PLEASE BAN THEM !!!

B.333 February 25, 2018 — Glenolden, PA

I drive a school bus and these lights have blinded me where I have had to stop the bus for a couple seconds...AND THERE ARE CHILDREN ON THE BUS! Ban these lights. They are NOT needed. Very dangerous!

B.334 February 26, 2018 — Horseheads, NY

It wasn't stupid enough to allow the auto industry to place a turn signal next to a BLINDING headlight. Now there allowed to make those lights so bright you can't see in front of you when one of those vehicles is behind you. I kind of got used to the spots in front of my eyes for 30 seconds when

looking for a turn signal, but now with this intense brightness, the turn signal is a much smaller problem. If it's night and someone with these lights is behind you, it's best to pull over and let them go so you have the ability to see. I had someone with these lights behind me and I could not make out where my driveway was to make the turn! Is this what our society has come to? Like everything else in this country, to someone it's all about money! Don't we have safety organizations in place to stop dangerous situations?

March 2018

B.335 March 1, 2018 — Miami, FL

I want to see laws implemented that makes it Illegal for automobile manufacturers to put in auto lighting that blinds other drivers. It's completely unnecessary to have such bright headlights. I also would like to see legislation passed that makes it Illegal for individuals to install aftermarket headlights that are blinding, distracting and light up the inside of your car like several high powered spotlights. They are a safety issue for motorists and pedestrians alike.

B.336 March 2, 2018 — Pittsfield, MA

It's absolutely debilitating to so after these light hit your eyes! They are finding out more and more how harmful these lights are. Yet have not got to the long term effects yet. They need to be removed before it's too late for some.

B.337 March 2, 2018 — Pittsfield, MA

These headlights are a danger.

B.338 March 2, 2018 — Rhododendron, OR

too bright is dangerous and painfully glaring to oncoming traffic. ask yourself if my lights are bright enough to see the next county over are they too bright?

B.339 March 4, 2018 — Bellevue, MI

Unbelievably dangerous. I would like to see lumen limits place on all exterior lighting personally. It is one of the many ways we are wrecking our environment, creating personal health and safety issues, and behaving irresponsibly. I am shocked this isn't talked about more. Being blinded by glare is an undeniable traffic hazard that desperately needs to be addressed.

B.340 March 6, 2018 — Houston, TX

The auto industry says that half of all new car headlights have a poor rating. They include the effect on the oncoming driver. If these are not stopped, driving at night will be next to impossible if every car has them.

B.341 March 6, 2018 — Rising Sun, MD

I have noticed this problem has gotten worse over the past several years.

B.342 March 7, 2018 — Glasgow, SCT, United Kingdom

I am now blinded on a daily basis by these things particularly at roundabouts and have had "near things". German marques are the worst. I have contacted my MP and the issue is with the UN for some bizarre reason. Donald, have you considered raising an e-petition on the Government website?

B.343 March 7, 2018 — Glasgow, SCT, United Kingdom

I am now blinded on a daily basis on these things and have suffered some "near things", German marques are the worst. Apparently, the issue is with the UN for some bizarre reason.

B.344 March 10, 2018 — Forest Park, GA

I am sick and tired of being temporary blinded by oncoming traffic, and light glare from my rear-view and side mirrors. Driving at night has become an absolute nightmare because. It's extremely frustrating uncomfortable and hurts my eyes.

B.345 March 14, 2018 — Bloomfiled, NJ

I agree!

B.346 March 16, 2018 — Waikoloa, HI

I can no longer drive at night, these lights cause me to lose my ability to see the whole field of vision.

B.347 March 17, 2018 — Franklin, GA

They are blinding to people. They actually make my eyes hurt!

B.348 March 17, 2018 — San Diego, CA

Aside from night blindings, I regularly get blinded during the *daytime* in my home's parking garage.

B.349 March 18, 2018 — Greenfield, IN

These are blinding to other drivers. They cause oncoming drivers to lose full field of vision especially on dark country roads. It's looks like they are coming at you with brights on. If they are behind you, there is a very bright glare in side and review mirrors. These lights need to recalled. There is no way these have not caused accidents.

B.350 March 24, 2018 — Ardentinny, SCT, United Kingdom

I've had times when oncoming headlights have completely dazzled me and they are not on full beam as its inner city.It is especially bad on duel carriageways and puts you off driving at night .l hope something is done.Many people arent even aware that you can lower your dipped headlights a bit.Manufacturers must do something snd so must government legislation.

B.351 March 24, 2018 — Clay, NY

I find that I need to squint my eyes and turn away from on coming traffic. Basically, I'm taking my eyes off the road. After the vehicle passes, my vision isn't clear. This is very dangerous.

B.352 March 24, 2018 — London, UK, ENG, United Kingdom

In the UK there's a trend to using fog lamps all the time. This is actually illegal here, except when visibility is bad, but many drivers think it's cool to have them on. Or something.

B.353 March 24, 2018 — Santa Cruz, CA

LED headlights send out flickering radiating rays of light that expand outward from the headlights of oncoming vehicles and make it nearly impossible for me to see the road and the edges of the road or even the markings on the road or anything that might be in the road in front of me. These LED headlights are extremely hazardous.

B.354 March 25, 2018 — Brantwood, WI

The lights are blinding

B.355 March 25, 2018 — Mayville, WI

These are a hazzard.

B.356 March 26, 2018 — Carthage, MO

It takes a second to dim your headlamps. Be kind and dim your brights for an oncoming vehicle.

B.357 March 26, 2018 — Carthage, MO

This is a pet peeve of mine. It's dangerous and unkind to not dim your brights to an oncoming vehicle!!

B.358 March 28, 2018 — Austin, TX

I have been driving more at night recently and have been blinded by oncoming headlamps to the point where I've had to pull over and wait for the spots blocking my vision to fade.

April 2018

B.359 April 4, 2018 — La Grange, IL

These headlights are blinding!

B.360 April 6, 2018 — United States

New Toyota Corolla S model was so bright in my rear view mirror I pulled over to let him pass. Oncoming traffic flashed this car, wow align your headlights to point at the road, not at the horizon.

B.361 April 7, 2018 — Darien, IL

Hurts my eyes

B.362 April 16, 2018 — Deltona, FL

I'm really having an issues with Toyota vehicles and also even as far as new Silverado trucks. These headlights are blinding when behind you. In front isn't as bad because they will pass eventually. But behind if they are matching you speed you're better off just slowing down to let them pass because of the headache they cause.

B.363 April 16, 2018 — Deltona, FL

Yes it's like a swirling array of blue and orange colors being emitted from those headlights. RIP my eyes to toyota corollas. Just had a 2018 Camry yesterday do the same.

B.364 April 18, 2018 — North Haven, CT

This is one of my biggest pet peeves. These LED lights are just bad. On cars or houses or streetlights doesn't matter. They are brutal. I drive home from work sometimes later and they blind me. Our world is becoming way too bright, loud and dirty. Do something.

B.365 April 18, 2018 — West Jordan, UT

The glare bothers me too And I drive a lot in the night

B.366 April 25, 2018 — Fond du Lac, WI

I drive to work everyday at night. I am disgusted at the amount of people putting these LED aftermarket bulbs in their halogen housings. They're made for a little halogen filament, not a bank of LEDS. Ridiculous glare and light splash. DOT compliant OEM ones are fine. These are ridiculous.

B.367 April 26, 2018 — Alpharetta, GA

During the day I have to adjust my rear view mirror to night position due to so many bright daytime headlights which makes any car without them essentially invisible. They are so bright, I frequently see drivers forgetting to turn on their normal head lights at night. Daytime lights should NEVER be bright enough to be used for night driving. Having to block my side view mirror with my hand until a car with these ultra blinding lights passes is also very dangerous.

B.368 April 26, 2018 — Elgin, IL

The trend towards high intensity headlights and other high intensity LED light sources is dangerous to the health and well-being of human and other animal races. Our next generation may well be partially blind if something is not done soon. Blinding of our current and next generation will be detrimental of our economic and creative potential. These high intensity lights make our environment highly prone to accidents, they affect wild life that is struggling to cohabit with us and share our planet. It's becoming hard to drive at night and even during day times. We must bind together to stop this craziness from polluting our visual environment. In the last few recent years, headlights, tail lights, street lights, lights on police/emergency cruisers, tow trucks, public buses have all in my opinion intensified to the tune of 3 to 10x. Head lamps emit white light/beam direct to eyes vs. the old method of reflection and natural light bulbs that used to disperse beams better. I have personally reduced my night/evening driving only to bare necessity and also walking out with kids at night. Do sign this petition if you can sense the danger, want our elected officials to create and enforce polices against this disaster and are concerned about our rights and our general well-being.

May 2018

B.369 May 6, 2018 — United States

#savelives

B.370 May 13, 2018 — Smyrna, TN

People are being Rude and Obnoxious and are Absolutely Absurd.Its is Being Used as a Tool to be Overly Aggressive to Other Law Abiding Citizens that are Following State Laws.Re:Posted Speed Signs On Interstates and Residential areas. People are using the BRIGHT LIGHTS without a necessary cause or REASON , NO ITS NOT THE HEADLIGHTS,ITS THE PEOPLE THAT ARE GOING OUT OF THIER WAY TO PROVE WHAT AN ASS THEY CAN MAKE OF THEMSELVES TO WITH NO REPERCUSSION OR PUNISHMENT. DAREING ANYONE TO STOP THEM. THEY ACTUALLY ARE TAKING THE GREATEST PLEASURE IN OFFENDING EVERYONE POSSIBLE TO GET THIER JOLLYS.YES ITS MOST AMAZING.ARROGANCE AND IGNORANCE AT ITS PEAK.ITS A NORMAL WAY OF LIFE FOR FOOLISH ASSHOLES..IRRITATE AND AGGRAVATE.

B.371 May 14, 2018 — Bemidji, MN

I have a vehicle where I am constantly being flashed by oncoming traffic. The headlights were adjusted, there was nothing in the back to make the headlights point up towards the sky, so I decided to get out and in front of the car to see why this has been happening. It wasn′t so much the actual light beam, but rather the "stylish" LED crap that overtakes the headlamp assembly. There is no way to turn these things off. I flipped the switch to parking lamps and attempted to drive down my driveway with only the LED accent lighting and parking lamps on. The LED accent lights did absolutely nothing as far as illuminating the roadway in front of me. They are just a nuisance to oncoming traffic. I have been doing my own silent protest by keeping my high beams on when approaching vehicles with LED light strips. I covered my LED light strips so they are no longer visible. I am at the point of frustration now where I want to be a vigilante and hit all the LED light strips with bright orange or green plastidip or duct tape. These lights have got to go!

B.372 May 18, 2018 — Hayward, CA

Some LED and HID lights are more intense than high beams and they should be used accordingly on deserted highways. In towns, with lively traffic they shouldn′t be used.

B.373 May 22, 2018 — Mercer Island, WA

Thank you...

B.374 May 28, 2018 — Tacoma, WA

Write a reply...people are so rude! bright blinding lights were invented by assholes

B.375 May 28, 2018 — Tacoma, WA

Toyota, BMW, and many other cars should be recalled to smash the fuckin LED out of them!

June 2018

B.376 June 1, 2018 — Appleton, WI

Because these lights are terrible

B.377 June 1, 2018 — Atlanta, GA

These LED lights are literally ruining my life. The combination of LED streetlights and car headlights is literally unbearable to me. I can only go out at night if someone else drives and I wear an eye mask. I am so freaked out by these lights I don′t know how I will live the rest of my life if these don′t go away. These lights cannot possibly be healthy for humans or animals. PLEASE MAKE THEM ILLEGAL!

B.378 June 9, 2018 — Nashville, IL

Led lighting should only be for off road use.

B.379 June 13, 2018 — Gore, VA

I′m tired of becoming ″blind″

B.380 June 19, 2018 — Australia

Bright low beam headlights are dangerous

B.381 June 19, 2018 — Huntsville, AL

It's no coincidence blue light is harmful to us during the night and the gov't and dot has allowed the steady increase of these blinding blue lights on trucks and cars. I'm pretty sure even car manufacturers are installing them on their new models and now at least 1/4 of all cars and trucks have them. But it's not only headlights it's street lights store lights lights for your house I read somewhere it's a weapon! The blue light during the night does major damage to our circadian rhythm. I drive a truck, 75% of the time during the night, and it's causing problems with my sleep, my mood, and gives me bad headaches...

B.382 June 25, 2018 — Seattle, WA

Some of these lights are color temperature of 10,000K. If you care about #lightpollution please follow @IDA international Dark Sky association. If your in #Seattle please follow @darkskiesseattle to help raise awareness and collaborate for changes.

B.383 June 27, 2018 — Athens, GA

If only Donald Trump was annoyed by these lights too.

September 2018

B.384 September 18, 2018 — Patchway, ENG, United Kingdom

I've seen the effects on sufferers.

B.385 September 18, 2018 — Taunton, ENG, United Kingdom

I find the modern lights very distracting and the very small indicator strips are very hard to see

B.386 September 18, 2018 — United States

i hate these damn things

B.387 September 20, 2018 — Bath, ENG, United Kingdom

I'm pissed off being blinded by some person who has not got a clue about road manners. Cyclists have these now front and red to the rear aldo blinding worse when they are the flashing type.

B.388 September 21, 2018 — Rochester, NY

I can't drive at night with these crazy bright lights!

B.389 September 22, 2018 — Peabody, MA

These headlights are not only blinding and dangerous to drivers but are also hell for those of us with extreme light sensitivity.

B.390 September 29, 2018 — United States

The blinding headlights are not only an issue for oncoming vehicles, but also for the cars driving immediately in front of said vehicles. While many rear-view mirrors have anti-glare capabilities, side mirrors do not.

October 2018

B.391 October 1, 2018 — Clarkston, MI

I am signing this petition because the number of bright headlights on cars in my area is increasing rapidly. I have a serious medical condition that makes my eyes sensitive to bright lights and as a result I am prone to visual disturbances, auras. These lights are not just in at night but all day long. They strike from my side mirrors and cause me to see spots. On time I ran a red light because I had bright headlights coming at me and from behind me. I couldn't see for seconds. It was scary.

B.392 October 1, 2018 — La Crosse, WI

As a newspaper delivery person, I find myself constantly blinded by oncoming lights. In my job, it's important for me to see the road to assess hazards, and not be blinded.

B.393 October 9, 2018 — Schenectady, NY

These lights have blinded me nearly causing an accident several times They should be banned!

B.394 October 25, 2018 — Teaneck, NJ

I have noticed this as a true problem for myself and believe it is extremely dangerous.

B.395 October 28, 2018 — Hattiesburg, MS

I'm tired of being blinded while driving!

B.396 October 28, 2018 — Petal, MS

Brenda Wilkerson

B.397 October 31, 2018 — West Sacramento, CA

These light cause actual pain and eye damage.

November 2018

B.398 November 3, 2018 — Mebane, NC

I too have been blinded by these lights

B.399 November 5, 2018 — San Jose, CA

LED sucks. Xenon is much better if you want the look.

B.400 November 6, 2018 — DELTONA, FL

I have night blindeness and these completely block my vision

B.401 November 6, 2018 — Germantown, MD

I hurts my eyes!

B.402 November 7, 2018 — Clear Lake, WI

Xexon and LEDs headlights should be banned. Today's halogen headlights are bright enough. The AMBER daytime running lights should be the only DRLs allowed.

B.403 November 7, 2018 — Portland, OR

everything in our environment is becoming ugly. why does this have to be the new normal. headlights are intimidating, cruel, mean, blinding, ugly.

B.404 November 8, 2018 — Fredericksburg, VA

While I'm all for a person customizing their vehicles with aftermarket parts, I don't see the need for these overly bright lights as regular driving headlights. Especially as factory headlights. I have almost been in a handful of accidents because of these lights. In these instances, my children were often in the car with me.

B.405 November 8, 2018 — Kamloops, Canada

I'm signing this petition because I am FED UP CONSTANTLY BEING BLINDED by these blue-white LED HEADLIGHTS!!! They HURT my EYES, NEGATIVELY AFFECT MY DRIVING since I can't 'see' the road at night (and day) after having the horribly blinding 'camera flash' of an oncoming vehicle (esp. trucks, vans & buses) with unacceptably bright LED HEADLIGHTS!!!

B.406 November 9, 2018 — MT, United States

Bloody bright lights cause accidents .

B.407 November 9, 2018 — Santa Maria, CA

Saftey While Driving

B.408 November 9, 2018 — shirley, NY

THEY ARE SOOOOOOOOOO BLINDING, MAKE ME SICK AND ARE DANGEROUS AND DEADLY. IT IS HONESTLY HORRIBLE THEY ARE ALLOWING THESE ON CARS!!!! IMMORAL

B.409 November 10, 2018 — Ashland City, TN

I very nearly hit a pedestrian who was walking on the side of the road wearing black clothing, I didn't see him until the last second because of some jerk's brights blinding me!

B.410 November 10, 2018 — Bellevue, WA

I'm 68 years old and when driving at night, bright headlights cause me difficulty.

B.411 November 11, 2018 — Afghanistan

I can't stand these HID headlights. I've almost went off the road cause they glare so much. Both my cars have normal halogen lights so now every time someone with HIDs is coming up on me I blast them with my high beams since they're low beams are blinding me.

B.412 November 11, 2018 — Spring Hill, TN

The LED lights can be blinding and can make driving difficult.

B.413 November 13, 2018 — Philadelphia, PA

Three lights are blinding, especially in single lane roads. They're dangerous and unnecessary. Common sense laws need to be passed regarding these lights, sooner than later.

B.414 November 14, 2018 — Crossville, TN

I hate those lights. I have almost wrecked many times over bcuz of them.

B.415 November 16, 2018 — Baytown, TX

I drive every night on a narrow two lane road to get home from work. I know the common rule is to look down at the road lines whenever an incoming car is in sight with lights, but there's no point when the car has bright LED lights that completely white out my vision. There have been several instances where I, and several of my friends and family, have nearly driven off the road because we couldn't see anything other than the blinding light of LED headlights. What's worse is that they aren't using fog lights or anything, it's just the normal headlights. That needs to be banned immediately.

B.416 November 16, 2018 — El Paso, TX

I am only 20 years old but I seem to have a light sensitivity issue with bright LED lights popping out of nowhere in the dark. The bright lights hurt my head and when I walk at night I need to cover my face or direction of where the bright light is coming. I noticed it’s abnormal because it bothers me much more than other people my age. I have to wait until March to tell my eye doctor about this problem. Even wearing sunglasses have not helped me.

B.417 November 16, 2018 — San Antonio, TX

They should be for emergency vehicles only IMO. Too many nuisance drivers, with no regard for public safety, blinding other motorists. Enough is enough.

B.418 November 17, 2018 — Milwaukee, WI

It's hard to avoid objects and people or cars in front of me when I can't see because of someone's blinding bright headlights.

B.419 November 17, 2018 — Woodburn, OR

I signed for all of the same reasons as others. These LED headlights are dangerous! I don't believe the problem is the LED technology itself, but how it is constructed (i.e. color, lenses, etc). More safety checks are necessary before dumping such things into the marketplace. In some cases, I have been blinded by these headlights even at a location ~30 degrees to the side! How can this possibly be considered safe? I am disheartened as I see this petition drive was launched around a year ago. I would have expected at least several hundred-thousand signatures by now :(

B.420 November 22, 2018 — Niederwald, TX

I've nearly ran bbn off the road or into several cars due to these blinding lights!!!!

B.421 November 25, 2018 — Overland Park, KS

I'm being blinded by headlight glare in my side view mirrors from newer, whiter headlights. We need to limit the color temperature!

B.422 November 25, 2018 — Waltham, MA

I'm signing this petition because I find the glare from headlights of oncoming cars blinding and dangerous. I hate driving at night now and am concerned that I will get into an accident due to the brightness of the headlights. It feels like the lights are piercing my eyes and it looks like all cars have their high beams on.

B.423 November 26, 2018 — Richardson, TX

They are too bright; everyone knows that!

B.424 November 28, 2018 — Manchester, NH

I had a pick-up truck on my back bumper the other night. The truck had 3 lights on each side. It lit up the interior of my car so bright I could have read small print on any contract. These lights are a menace and need to be banned.

B.425 November 28, 2018 — McLean, VA

I wear screenvision/blue light reducing glasses when I drive at night, but I shouldn't have to do that. The lights are the problem, not my eyes.

B.426 November 28, 2018 — Morris plains, NJ

I am blinded at night by these glaring lights

B.427 November 29, 2018 — Burlington, United States

Even when people get behind you these things blind you, I'm not saying they should ban them for off-road use but on the road it shouldn't be allowed, what was wrong with the old headlights? They're so bright and every vehicle turning the glare changes direction and hits spots causing a glare to where drivers can't see, anyone can easily get blinded with the sun as it is and run off the road, into other vehicles and then who's fault is it if they couldn't see cause they were blinded? Still theirs.. After losing my grandfather in a vehicle accident many years ago, I feel people shouldn't lose their lives and the vehicle they worked so hard for over a silly blinding lightbulb.

B.428 November 30, 2018 — Whitehouse Station, NJ

Every state needs to reaim headlights during the annual vehicle inspection, if they don't have inspection institute one! Also the truck drivers with the 36" wide light bars on the front need to go. If you are the only one on the road light it up, when others are just in front of you shut em down.....at this point emissions take a back seat to being blinded.

December 2018

B.429 December 2, 2018 — Saratoga Springs, NY

Sick of these LED lights blinding me at night on the road. It doesn't matter if the vehicle is oncoming or behind you. Lights that bright are ridiculous and can cause accidents. Get rid of them.

B.430 December 3, 2018 — Green Bay, WI

How is paying $10 going to get this seen to 150 more people? I think this petition is a scam to make money!!! I have over 13,000 followers, on one of my google accounts - it does NOT cost $10, nor $5 or even $3 to "help" get this petition seen by more people! Besides, the issue is already illegal, just write to the secretary of the DOT! See my LONGER VERSION of my 'comment' bellow!

B.431 December 3, 2018 — Green Bay, WI

I have a few things to say about this *BLINDING HEADLIGHT* "petition"... 1) there are a number of different issues here. Not only are the BRIGHT lights SO WRONG, they are ALREADY

suppose to be under so many candle power set from the factory. THEY ARE ILLEGAL ALREADY! We do not need to "petition"!!! If the DOT did their job, they would have been changed already. 2) Lights that move, are illegal! They were banned back in the 50′s! Lights that move up or down are STUPID and the people who have them looks like they are flashing their brights at me/us when they 'float' up and down!!! Even the COPS have these on the Ford suvs! THEY ARE ILLEGAL! If the DOT did their job, they would have been changed already. YOU PEOPLE NEED TO WRITE TO THE DOT!!! Not start a petition! 3) There is another issue here that is not being covered; the use of MORE THAN TWO SETS of lights are ILLEGAL in the State of Wisconsin, and I think many other states, if not all of them!!! Look it up! The DOT standards are on the internet! LAW STATES, NO MORE THAN 4 FORWARD WHITES AT ANY GIVEN TIME can be used!!! These auto companies know this! But the foreign companies started making these stupid "eye brow" lights around the other head lights, and they make it even brighter! These are technically ROPE LIGHTS, that are also ILLEGAL!!! They sometimes have 15 LEDs in them! plus with the other 4 white lights make make 34 or more forward white lights!!!! When no one is allowed more than 4 at any given time on the road!!! 34 or 4? hmmm. WHITE TO THE DOT PEOPLE!!! Also,,, why the hell are the police not enforcing the laws we ALREADY HAVE IN PLACE??? Addition non-sense: REVERSE LIGHTS! Reverse lights on a motor vehicle are ONLY to be illuminated when the vehicle is IN REVERSE, AND ABOUT TO BACK UP!!! Not on for ANY amount of time when no one is in the car!!! WHY THE HELL ARE BACK UP LIGHTS ON WHEN PEOPLE ARE WALKING AWAY FROM THEIR CARS??? THIS IS STUPID AND CRAZY! How long has the average person sat waiting in parking lots, waiting for a car or truck to back out??? WRITE TO THE DOT! DO NOT MAKE PETITIONS! If you make a petition, the assholes (or ignorant dumb-asses) doing the wrong will think they are in the right to begin with, when in fact, THEY ARE IN THE WRONG, AND THESE AUTO MAKERS NEED TO BE FINED, AND MADE TO RE-CALL ALL OF THESE new cars and trucks that run with more than 4 lights (they use to program/design switches to make the 'fog' or other lights on the bottom go OFF when the brights were activated! That was because they KNEW only FOUR FORWARD WHITE LIGHTS were allowed at ANY given time! The "brights" are another set of illuminating elements or (LED) and thus making it 4 lights on the front of vehicle - to comply with DOT standards and federal LAW! But why are they ignoring the law??? THE LAWS DID NOT CHANGE! SO ANYONE DRIVING AROUND WITH 6 LIGHTS ON, OR MORE, ARE VIOLATING THE LAW! This petition is BS! I signed it at first because I thought more people need to know there is a problem and like me, THEY BLIND ME!!! I CAN NOT SEE PAST THEM STUPID CARS OR TRUCKS! But when i started getting e-mails asking me for money??? NO! $10 to get this out to 150 more people??? NO! THAT IS NOT RIGHT! NOT $5 EITHER! AND NOT $3!!! WAKE UP PEOPLE! JUST WRITE TO THE LADY IN THE DOT OFFICE; SHE IS THE ONES ALLOWING IT! LOOK IT UP!

B.432 December 3, 2018 — Green Bay, WI

It′s actually against the law to have more than 4 (four) lights on at any time while driving.

B.433 December 3, 2018 — Green Bay, WI

It′s actually against the law to have more then FOUR (4) forward white lights one at ANY given on the road. They need to be reported then. EVEN MULTI-BEAM LIGHTS are ILLEGAL! And these multi-bean LED lights are NO exception and are ILLEGAL to use. Write to the DOT, tell them to enforce the LAW.

B.434 December 3, 2018 — Green Bay, WI

It′s actually against the law to have more then FOUR (4) forward white lights one at ANY given on the road. They need to be reported then. EVEN MULTI-BEAM LIGHTS are ILLEGAL! And these multi-bean LED lights are NO exception and are ILLEGAL to use. Write to the DOT, tell them to enforce the LAW.

B.435 December 3, 2018 — Green Bay, WI

same here

B.436 December 3, 2018 — Green Bay, WI

same thoughts exactly!!!

B.437 December 3, 2018 — Green Bay, WI

For whatever reason my comment was not posted, so entering it again: 1) there are a number of different issues here. Not only are the BRIGHT lights SO WRONG, they are ALREADY suppose to be under so many candle power set from the factory. THEY ARE ILLEGAL ALREADY! We do not need to "petition"!!! If the DOT did their job, they would have been changed already. 2) Lights that move, are illegal! They were banned back in the 50′s! Lights that move up or down are STUPID and the people who have them looks like they are flashing their brights at me/us when they 'float' up and down!!! Even the COPS have these on the Ford suvs! THEY ARE ILLEGAL! If the DOT did their job, they would have been changed already. YOU PEOPLE NEED TO WRITE TO THE DOT!!! Not start a petition! 3) There is another issue here that is not being covered; the use of MORE THAN TWO SETS of lights is ILLEGAL in the State of Wisconsin, and I think most every states, if not all of them!!! B.438 December 6, 2018 — Desborough, ENG, United Kingdom

It's really bad now

B.439 December 6, 2018 — Houston, TX

We used red lights in the Army for night operations. They don't over stimulate your eyes and allow quicker recovery when going back to darkness. This has been known for a very long time. I dont understand why our government ever allowed these super bright lights to become such a menace...

B.440 December 6, 2018 — Mascouche, Québec, Canada, Canada

Les lumières des voitures me donne beaucoup de migraines , depuis que j'ai cesser de conduire lorsqu'il fait noir je n'ai plus de migraines. C'est très aveuglant et donc très dangereux de conduire en étant aveugler, car les voitures en sens inverse nous aveugle , il est impossible de voir une bêtes ou un piéton qui serait sur la voie.

B.441 December 7, 2018 — San Jose, CA

LED headlights and taillights are a catastrophe. It's unbelievable that our government is allowing this. How are we supposed to even drive anymore?

B.442 December 8, 2018 — Emporia, KS

I live in a fairly rural area where many of the roads are narrow, lack white lines and have little to no shoulder. Wildlife in the road is also a big concern. These lights make it impossible for oncoming drivers to see the edge of the road or hazzards on the shoulders.

B.443 December 8, 2018 — West Mifflin, PA

Because I am blinded to the point of getting in an accident at least 4 times every morning and every night. I don't want to die!

B.444 December 8, 2018 — elkton, MD

Some jerk tailgating me for over ten minutes caused nightblindness in my one eye that couldn't avoid the glare. And I legit cannot properly see the road or its markers when passing other cars with this, and they seem to only be growing in population...

B.445 December 9, 2018 — Ellwood City, PA

Lights are to bright and cause others to be blinded

B.446 December 9, 2018 — Gray, ME

A police officer had a car pulled over on the side of the road with blue led lights signaling. I slowed down to go around but thought the officer was in the vehicle. I was HORRIFIED as I drove past to suddenly be able to see that the officer was actually outside his vehicle and that I was unable to see him until I had come alongside him. The blue leds did not illuminate the area. They bathed the area in blue color. This distorted what I was able to see. I worry for everyone's safety with the use of led.

B.447 December 9, 2018 — Lomita, CA

I am a car and motorcycle enthusiast I fitted off road Halogen lights to my vehicles for decades I remember getting tickets for using my lamps on a highway Never blinding others Late night Dark conditions Still the officers hidding behind a tree will find the excuse to issue a citation Well Today we get 500% more glaring and blinding lamps on the road and those are used as regular headlamps Those blind and glare to extreme lévels Needless to say a corrupted DOT has allowed those lamps to be used on cars putting safety on the side I do not see policemen ticketing drivers BMI ding others with their Zenón and LED lamps because the DOT has allowed them to be used on highways and the police follows this corrupted decision by the DOT We need impeach the officials from the DOT and send them to jail for having put aside safety in the place for money given to them by car manufacturers We need action Impeach the DOT

B.448 December 9, 2018 — North Haven, CT

It's so hard to drive at night with these glaring lights. Unnecessary evil.

B.449 December 9, 2018 — Six Lakes, United States

Those headlights are blinding to oncoming traffic!

B.450 December 9, 2018 — Tampa, FL

They are too bright and dangerous

B.451 December 9, 2018 — bastrop, TX

When I come upon headlamps and police cars that have blinking lights, these days those colored lights blind me for several seconds .. seriously impairing my ability to safely navigate for a ways down the road. It's frightening. There is serious enough risk in recovery time That it might as well have been distracted driving cell phone use. The eyes are rendered useless in these events. Why are the safety patrols using blinding lights⁉⁉

B.452 December 10, 2018 — Hudson, MA

These headlights are extremely dangerous and uncessary. I can see the road just fine at night with mt regular lights.

B.453 December 10, 2018 — MA, United States

because my eyesight and anxiety are bad enough already, and i don't need your jackassery to fuck the road up for me

B.454 December 11, 2018 — Edgerton, KS

It's dangerouse to be blinded while driving

B.455 December 11, 2018 — Fairfax, VA

I sometimes literally end up seeing spots after a car on the other side of the highway blinds me.

B.456 December 11, 2018 — Las Vegas, NV

These headlights are causing me to be blinded so often it's a wonder I haven't gotten in An accident yet. It's a matter of time. . This is ridiculous they are a danger to everyone on the street except the people who have them.

B.457 December 12, 2018 — Austin, TX

I've never had problems with oncoming lights until recently. To me these new headlights are more of a problem than the older lights on high beam. Please ban these lights and create standards that work for the driver and their fellow drivers.

B.458 December 12, 2018 — Circleville, OH

Cataracts make night driving difficult. Bright lights cause halos and are distracting.

B.459 December 12, 2018 — Los Angeles, CA

I'm terrified to drive in the evening because of this!!!

B.460 December 12, 2018 — Newfane, NY

General Motors, pickups are blinding, GM is the worst must be cheaper headlight setup as gm will blind u to save .50¢

B.461 December 12, 2018 — Seattle, WA

Bright LED headlights actually make it harder to see at night because of the glare. Please take measures to lower the intensity of these headlights!

B.462 December 12, 2018 — Trout Lake, WA

I live out in a rural area. At night, when an oncoming vehicle has HID/LED headlamps, about 90% of the time, I'm blinded to the point of barely being able to see the white line. Much less a deer, raccoon, or rare pedestrian.

B.463 December 12, 2018 — United States

As everything else concerning safety is regulated on a vehicle , it is baffling why headlights are not! Some of these lights are more blinding to on coming traffic Than high beams.

B.464 December 12, 2018 — Wytheville, VA

I hate those headlights

B.465 December 13, 2018 — Bellevue, OH

Those lights are blinding and dangerous at night! I have eye problems and because of those lights, I can't drive at night. Please ban them!

B.466 December 14, 2018 — Des Moines, WA

People don't see the bigger picture here. They think if they have brighter headlights it makes everyone safer. That couldn't be further from the truth. When you blind oncoming traffic with your blinding headlights it makes it harder for them to see pedestrians crossing, makes it harder to see potholes in the road, makes it harder to see curbs. Many things! And what ever happened to properly aimed headlights? Is it even possible to aim LED's? Most of the time they look like they are aimed both high and low. This is very dangerous!

B.467 December 14, 2018 — Des Moines, WA

That is exactly the point I try to make to people.

B.468 December 14, 2018 — Des Moines, WA

I was trying to turn into a business parking lot recently and ran over a curb because i got blinded by laser headlights. I was so pissed!

B.469 December 14, 2018 — Des Moines, WA

I'd like to follow them to where they park their vehicle, and then spray black paint over their shitty lights! But I don't want to go to jail because of them being assholes!

B.470 December 14, 2018 — Des Moines, WA

I got "attacked" a couple nights ago by a Jeep coming toward me with 6 headlights, and they were all blinding LED's. They had the 2 blinding headlights, plus 2 blinding foglights, PLUS a light on each side of the windshield that hung out above their rear view mirrors, and those ones were seriously blinding because of their high mount, and total disregard for proper aim! I bet those are illegal for street use anyway. Why don't cops pull those shitheads over and cite them? and those rectangular all-LED light bars, aren't they only for off road use? I keep getting blinded by those, too!

B.471 December 16, 2018 — Rockville, VA

This truly is a serious threat to our society. While new types of lighting help in certain situations, the end result is causing more harm than good. We need a more gentle spectrum that accomplishes safer driving for all. Go NHTSA and save us. Please fulfill your mission for all of us esp. Our new drivers, our children.

B.472 December 16, 2018 — bauxite, AR

Hate the bright lights

B.473 December 17, 2018 — Azusa, CA

I find it unbelievable that we allow these horrific blinding headlights to create a peril to drivers. Please ban them.

B.474 December 17, 2018 — Doncaster, ENG, United Kingdom

It's completely true. Everyone is saying it.

B.475 December 18, 2018 — Greenville, PA

I have complex migraines that are triggered by light. Driving at night has been made unbearable due to these headlights. During a 7 hour road trip recently I was so afraid I would wreck. There were hundreds of times on that journey that I simply couldn't see.

B.476 December 18, 2018 — Manchester, NH

I had the same thing happen to me a few weeks ago. At first I thought I had at least two vehicles behind me. The 6 headlights (3 on each side) also had the smaller bulbs surrounding them. The smaller bulbs alone put out more candlelight power than my high beams. In all, I would not be surprised it I had 6 large bulbs and at least a dozen smaller bulbs in my rear view and side view mirrors. I was totally blinded and had to pull off to the side to let the idiot pass me.

B.477 December 18, 2018 — Manchester, NH

I think it is funny that not too long ago you could get a ticket for having your high beams on when approaching oncoming traffic. Now, one of those bulbs is 10X brighter than the old high beams. And they have a lot of those bulbs on some of the trucks.

B.478 December 18, 2018 — Manchester, NH

Makes you wonder how the auto industry got these okay'd? How much did they have to pay someone off to get these made legal?

B.479 December 18, 2018 — Troy, NY

I'm signing because if nothing happens and the only choice left is to be forced into having the bright lights, we all lose.

B.480 December 18, 2018 — londonderry, NH

these lights are way too bright.

B.481 December 19, 2018 — Houston, TX

I'm tired of being blinded and almost wrecking every night from work. I can't take it anymore.

B.482 December 19, 2018 — mansfield, OH

they are dangerous. My car sits pretty low and when trucks or jeeps are coming toward me I can not see.

B.483 December 20, 2018 — Belchertown, MA

I'm signing because I'm tired of having pick up trucks behind me in my car blind me with their LED headlights. They are also blinding when coming at you on the opposite side of the road.

B.484 December 20, 2018 — Hamilton, Canada

These lights are irritating honestly arent high beams enough when you need bright lights to see the road. I have to wear sunglasses at times to be able to make it through my drive home from work. I've had spots in my vision and had to pull over. Seriously these lights gotta go I'm done with them they should never even became a thing.

B.485 December 20, 2018 — Milton Keynes, ENG, United Kingdom

On multiple occasions I have been close to either going off the road, or even hitting head on with another vehicles due to the ridiculous brightness of LED/HID headlights. For the safety of all road users they should be either banned or at least regulated.

B.486 December 20, 2018 — Portland, OR

Those lights are blinding

B.487 December 20, 2018 — Provo, UT

I hate the ultra bright headlights so much! They might help the driver possessing them to see better but the rest of us are blinded and at risk of injuring ourselves or others as a result.

B.488 December 20, 2018 — Scotch Plains, NJ

I am signing this petition because with car sales down and SUV sales up, these exorbitantly bright lights are increasingly difficult to avoid. I don't see how they make driving safer when approaching cars are blinded.

B.489 December 20, 2018 — Tacoma, WA

I'm sick of being Blinded by headlights. Blinded by a douche who's driving with his high beam lights!

B.490 December 20, 2018 — coos bay, OR

I prefer to be able to see when driving at night.

B.491 December 21, 2018 — Louisville, KY

I get blinded at night with these lights . i have sensitive eyes to bright lights and cannot drive at night because of these headlights

B.492 December 21, 2018 — Minnetonka, MN

Whether it's a vehicle coming towards you (blinding direct lights) or a large vehicle behind you (blinding through the rearview mirrors), these HID/LED/blueish lights pose a huge safety risk to other drivers. A few seconds without being able to see your surroundings on the road are enough to cause a major accident.

B.493 December 21, 2018 — Mission, TX

My epileptic partner can't even be in the passenger seat without getting a seizure cause of these stupid lights.

B.494 December 21, 2018 — Riverhead, NY

I wear glasses with an anti glare protection. They do not work with the new blinding headlights. The glare is blinding, the range of luminescence / beam is to far outward blinding oncoming traffic. Dangerous and disturbing during and after the lights hit my eyes.

B.495 December 22, 2018 — Ctr Barnstead, NH

We need these banned

B.496 December 22, 2018 — Millbury, MA

It's very difficult to see driving at night. I have children. Those lights should be banned!

B.497 December 22, 2018 — Port St. Lucie, FL

trump Is dumber than a head light, and even he had taken lives. that's all.

B.498 December 22, 2018 — United States

greg bond,it's to much light and distracting on the road!

B.499 December 22, 2018 — columbia, SC

I'm a driver

B.500 December 23, 2018 — HONDO, TX

I drive a winding hilly country road frequented by caravans of tire testers. If they have LED lights it is punishing and dangerous.

B.501 December 23, 2018 — Hudson, NH

They should not even be legal

B.502 December 23, 2018 — Memphis, TN

I have chronic migraines & driving at night has become impossible. Because these headlights trigger them instantly.

B.503 December 23, 2018 — Toronto, Canada

It's simply blinding.

B.504 December 25, 2018 — Rochester, MN

They're too damn bright!!!

B.505 December 26, 2018 — Chevy Chase, MD

I'm tired of being blinded in traffic. It's dangerous.

B.506 December 26, 2018 — Feasterville-Trevose, PA

Those lights should be banned.

B.507 December 26, 2018 — South Chatham, MA

I do not have any sensitivity to light, lack of vision, etc. and these lights are still extremely blinding. Who is to blame when these lights cause a fatal accident? This needs to stop.

B.508 December 26, 2018 — Woodbridge, VA

I'm being blinded at critical driving decision moments by cars with these lights. The blinding effect lasts after the car has passed putting us all in danger.

B.509 December 27, 2018 — Sebastian, FL

These headlights are hazardous! There should be light levels limits on vehicles.

B.510 December 28, 2018 — Cork, Ireland

This is an international epidemic affecting road users as a result of very poor design decisions by car manufacturers. Their drive towards making a car seemingly safer for a driver in fact is making those very cars a lethal danger to other road users, including other car drivers. Glare is lethal. Blinding, blue-white headlights are lethal. The trend towards ever brighter lights, front and rear, is lethal. Just because car manufacturers can make their car lights brighter doesn't mean they should. They are creating conditions that will kill increasing numbers of people in years to come.

B.511 December 28, 2018 — pittsburgh, PA

These lights blind me, not to mention Science shows us that blue spectrum light contributes to macular degeneration.

B.512 December 29, 2018 — Goirle, Netherlands

Yep! Always a problem, here too!

B.513 December 29, 2018 — Midland Park, NJ

It makes it very difficult for me to see! I can't wear sunglasses at night and it's truly hard to keep my eyes open with some cars.

B.514 December 29, 2018 — Woodland Hills, CA

Imagine you are driving along a winding canyon road, in the dark, no lights except the stars and the moon. You have very good vision, but you have the normal visual reactions of a person 65 years old. You have an excellent driving record. However, a car comes around a curve from the opposite direction, with headlights that send a blinding, searing light to your retinas, and completely wash out your visual field for 5 seconds or more. You know the curve up ahead, you are familiar with the road, and so you gently come to a stop (an abrupt stop could cause the car behind you to either swerve or push you over the side), and briefly wait to recover your vision. But maybe next time, or some other unsuspecting driver won't react so well, or won't have time, or just won't know the road well enough. These lights are murderers.

B.515 December 29, 2018 — s Fallsburg, NY

They are very bothersome.

B.516 December 30, 2018 — De Pinte, VOV, Belgium

because I trust Martin Cohen

B.517 December 30, 2018 — Oak Lawn, IL

Preserving vision and saving lives is important

B.518 December 30, 2018 — Plano, TX

I live in the country and drive on dark winding roads. Oncoming blinding LED headlights make it dangerously impossible to see anything for several seconds!

B.519 December 31, 2018 — East Greenbush, NY

I am often blinded by these lights and it seems to be getting worse. There seem to be more and more vehicles on the road like this. I consider it a road hazard.

B.520 December 31, 2018 — Winston, GA

The new headlights on cars and trucks are absolutely blinding to me when I'm trying to drive at night. I cannot believe these are even legal! I have seen trucks with additional LEDs added as a third front light that are SO BLINDING that have to shield my eyes from them, almost running off the road. When I was learning to drive many years ago, it was STANDARD practice as well as common courtesy to dim one's lights when approaching an oncoming car or when following behind another car. Now it seems the more obnoxiously bright one can be with their lights, the better?! This is NOT OK.

Comments left in 2019

January 2019

B.521 January 1, 2019 — Eureka, MT

These things are like staring into and aircraft landing light.

B.522 January 1, 2019 — Long Beach, NY

It hurts the eyes, it takes longer to adjust the eyes after looking at it through rear view mirror.

B.523 January 2, 2019 — Roxbury, MA

When a car with those bright bluish lights is heading straight towards me on a winding country road, everything else becomes completely invisible. I no longer will drive those roads at night, until those lights are outlawed.

B.524 January 3, 2019 — Dearborn, MI

I'm getting tired of getting blinded by these headlights. They may work for the drivers of these vehicles but are dangerous to oncoming cars. They need to be banned!

B.525 January 3, 2019 — Indianapolis, IN

Those damn bright lights are gonna kill someone one day

B.526 January 4, 2019 — Indianapolis, IN

just signed it they are so damn dangerous last week I was on a 2 lane road about 9 pm and some asswipe coming from the other way blinded me so bad i had to stop the car and wait for him to pass i flashed my high beams at him from over 100 feet away because they looked like they were on then he flashed his and omg thats when i damn near went in to a ditch it took about 30 seconds after he passed for my eyes to go back to normal

B.527 January 5, 2019 — Eau Claire, WI

Those lights blind me !!

B.528 January 5, 2019 — West Hurley, NY

I'm signing because I have a similar problem being blinded by headlights!

B.529 January 6, 2019 — Adena, OH

I have nearly been in accidents because of being blinded to the point where I can't see the road!

B.530 January 8, 2019 — Harrisonburg, VA

I am unable to see when they are coming. I have gone off the road because I have lost the road in the light. They also cause pain

B.531 January 10, 2019 — Portland, OR

These are a danger to public safety.

B.532 January 10, 2019 — San Jose, CA

More cities are switching to LED street lights to increase energy efficiency. There is absolutely NO REASON—other than pointless vanity—why people in our cities need LED or HID headlights on their vehicles. It doesn't help that auto manufacturers are abetting this unnecessary and dangerous trend by fitting their vehicles with HID headlights that are too bright, even when meeting current code. And though blue-white headlights are illegal in my state of California, after-market conversion kits are available on the internet. These lights are a menace and a safety hazard, and are not needed in brightly-lit cities.

B.533 January 11, 2019 — madisonville, TN

I have been complaining for a couple years about these lights. I can't believe they are legal. I literally have to shut my eyes when passing a car with HID/LED lights. I have almost ended up in the ditch from being blinded. They are straining to the eyes. I have perfect vision, I'm 27, and in good health. Tired of people with them saying we shouldn't be driving at night if we can't handle it.

B.534 January 13, 2019 — Honoraville, AL

I suffer chronic migraines and they definitely trigger them, but they also cause eye pain and difficulty seeing at night.

B.535 January 14, 2019 — Asheville, NC

For the record, it is not a senior's problem with a brightness of these halogen headlights!... It is a common sense problem! I'm in my forties and I've had terrible frustration at these headlights for years now. I am a former professional truck driver of many years and I have to say, the worst are tractor trailers with these headlights as they set up higher than regular cars and are terribly blinding when they drive behind you, let alone the problems oncoming. Note to the National Highway Traffic Safety Administration, it doesn't take a study to realize that the lights are blinding, just common sense! .... stop your studying and start saving drivers by Banning these VERY DANGEROUS headlights!

B.536 January 15, 2019 — Ann Arbor, MI

The increase in the brightness of headlights produces frequent situations in which even the "low beams" from many cars are dangerously bright and distracting, often making lane-marking marks and pavement boundaries harder to discern.

B.537 January 15, 2019 — Columbus, IN

I'm glad you can see into the future and all, but I'd like to see where I'm going too.

B.538 January 16, 2019 — MESA, AZ

I have almost run into cars several times when trying to change lanes, due to being blinded by LED lights on vehicles behind me!! If windows tinted too dark is illegal, this should be a no-brainer!!!!!!

B.539 January 18, 2019 — College Station, TX

Countless near misses from LEDs and hids in the wrong housings on these jacked up trucks.

B.540 January 19, 2019 — Pinckney, MI

I drive a long way to work and I am encountering more and more vehicles with these types of lights. I cannot believe they are allowed. It appears engineers only considered one side if this equation! I have recently seen pick-up trucks with basically two headlights on each side of the vehicle! Enough already!

B.541 January 20, 2019 — Cutchogue, NY

Every night i drive and have to divert my eyes from the blinding effects of these lights on the road ahead or reflected in my mirrors from behind. I can see the shadow of my own car infront of me from the illumination of these bright lights. It is very unsafe. It affects my ability to see clearly. These lights need to be outlawed and replaced with safer lights.

B.542 January 20, 2019 — United States

I have a hard time driving at night because of all the glare and feel like everyone has their brights on. My husband feels the same.

B.543 January 20, 2019 — Wasilla, AK

These are blinding and very dangerous. I drive a school bus and these lights produce intense glare to the point of no one being able to see children at bus stops. It's just a matter of time until tragedy occurs.

B.544 January 21, 2019 — Ashland, KY

I've been a truck driver for almost 37 years people driving today don't know what a dimmer switch is or how to adjust there lites or if the car come with driving / fog lights in the bumper they run them constantly to out of adjustment

B.545 January 21, 2019 — Austin, TX

Let's Make Blinding Lights Against The Law & punishable by PISTOL WHIPPING AND ARREST!!! This problem has become a "cancer" because as young generations begin driving, they think these

blinding lights are "normal" because this is all they know. New generations of drivers don't know any different. My Opthamologist STOPPED driving at night because it was damaging to her eyes!!! The above article is Spot-On when it says, " ... A visual field so polluted by distracting glare that the brain has a hard time keeping focused on the important subjects like pedestrians in a crosswalk." Brighter is NOT SAFER. The time to Act is NOW.

B.546 January 21, 2019 — Edina, MN

I have been blinded many times by LED headlights especially at night. Very dangerous!

B.547 January 21, 2019 — Hanover, NJ

Patrice Barry

B.548 January 21, 2019 — Pine, CO

The blue-rich glare from these high kelvin lights are a safety hazard. We must change this dangerous trend!

B.549 January 21, 2019 — Seattle, WA

What we really see in a city like seattle with pedestrians and people on bikes is other drivers can’t see them because they are in the glare-zone-of these awful unsafe high-lumen-High-Kelvin lights. #VisionZero

B.550 January 21, 2019 — United States

These lights are as bright as high-beams used to be and catching one in the face as a driver crests a hill can be totally disorienting!

B.551 January 21, 2019 — W. Hempstead, NY

PLEASE THIS IS INSANE VVITH THESE LIGHTS!!

B.552 January 21, 2019 — Waretown, NJ

I’m afraid to drive at night because of these lights

B.553 January 22, 2019 — Burnley, ENG, United Kingdom

It is vertually impossible to see when blinded by these headlights

B.554 January 22, 2019 — Cypress, TX

Me too!

B.555 January 22, 2019 — Northville, MI

I CANNOT SEE

B.556 January 22, 2019 — Pāhoa, HI

I signed it because I’m not a selfish idiot and neither are you ! BAN THEM!!

B.557 January 22, 2019 — St. Petersburg, FL

It's dangerous and I'm tired of being blinded at night.

B.558 January 22, 2019 — Stretford, ENG, United Kingdom

They do blind you as they approach and you lose your night vision for a moment.

B.559 January 22, 2019 — United States

I agree

B.560 January 22, 2019 — United States

I'm blinded every night by oncoming drivers of newer vehicles with LED headlamps. So Bright that i signal the oncoming driver to turn off his high beamsonly to have the driver toggle his high beams and absolutely blind me. To the point that i have to pull off the road way because i can't see. It scares me. Even on low beam LED headlights are disruptive to other drivers ability to see. In fact Even when a driver behind you has LED lamps it reflects off of rearview and side mirrors to the degree that its

blinding. As the driver of a compact and miss size car is like to add that the problem of blinding headlights seems worse too me when the oncoming vehicle with LED lights are larger trucks.

B.561 January 23, 2019 — DALLAS, TX

I thought I was the only person that notice this.

B.562 January 23, 2019 — Levittown, NY

I feel the headlights are very blinding and dangerous to everyone on the roads

B.563 January 23, 2019 — Pahoa, HI

People need to have good vision at night, and intense light is not a good way to do that.

B.564 January 23, 2019 — San Juan, PR

I am signing this petition because I am tired of being blinded by the lights of oncoming vehicles while I drive at night. I can't use the visors to shield my eyes since they won't go lower. I thought car designers were placing high beams higher up on SUVs and 4x4s. Please make changes so driving at night is safer for those who are blinded by these lights. If these lights also harm the environment then please ban these lights.

B.565 January 24, 2019 — Binghamton, NY

It's very dangerous. The blinding glare from oncoming vehicles with these new headlights are a concern to me and many other drivers I've talked with. Thanks.

B.566 January 24, 2019 — Chicago, IL

These lights are blinding and dangerous. I can't imagine driving at night when every car has them. Let's use some common sense and put people first.

B.567 January 24, 2019 — Macclesfield, ENG, United Kingdom

It stops me driving at night

B.568 January 24, 2019 — Nutley, NJ

These headlights are blinding when driving at night and it’s unsafe for drivers either in front of you or opposite side traffic

B.569 January 24, 2019 — University Place, WA

#banblindingheadlights #banledheadlights #banhidheadlights #banlaserheadlights #recallcarswithblindingheadlights #banledlightbars

B.570 January 24, 2019 — Yonkers, NY

These lights are worse than someone having their bright lights on. Make these lights illegal and take them off the road now.

B.571 January 25, 2019 — Buchanan, TN

I suffer from night blindness and have to pull over so my eyes can readjust.

B.572 January 25, 2019 — Seymour, TN

I'm tired of being blinded with bright lights also!

B.573 January 26, 2019 — Bowling Green, MO

DRLs were never intended to be a safety device.

B.574 January 26, 2019 — Chesapeake, VA

Those bright white LED lights in new cars are so blinding that it makes it hard to see the lines of the road. It has nothing to do with drivers with bad vision. I have 20/13 vision, and have a really hard time seeing what’s in front of me when someone’s regular headlight beam are brighter than most high beam.

B.575 January 26, 2019 — Portland, OR

I have to reposition my rear view and side view mirrors when one of these cars with blinding headlight lamps is behind me. I have perfect vision and light sensitivity and this is a very dangerous and irresponsible design of these vehicles. It is as dangerous to other drivers as cars with poor braking systems. I demand these headlight lamps be recalled, fixed, and banned from future use in any country.

B.576 January 26, 2019 — Tacoma, WA

Ban the fuck out of the blinding muthafuckas!

B.577 January 26, 2019 — Tuckahoe, NY

I almost swerve off the road each day from people shining their not-high-beams at me. I am sick and tired of putting the lives of that many people at risk for something so trivial.

B.578 January 26, 2019 — United States

I have experienced temporary blindness several times due to excessively bright headlights...

B.579 January 27, 2019 — Orléans, Canada

These lights will also create accidents

B.580 January 27, 2019 — Tacoma, WA

I'm signing because those lights OBVIOUSLY should be illegal, they are TOO bright and it is difficult to drive at night when someone is behind you or passing you with these lights.

B.581 January 28, 2019 — CINNCINATI, OH

Sonja Darling you get blinded by the bright led lights it makes you not be able to see at night

B.582 January 28, 2019 — Cincinnati, OH

I have been blinded to the point I run off the road more times than I can count. They are dangerous, and honestly dont understand how lights so distracting made it to production. They should have been axed long before that.

B.583 January 28, 2019 — Galax, VA

People such as myself that have what is known as night blindness is a struggle in itself trying to drive at nighttime, add rain in that mix it's twice as hard to see your side of the road. So when you meet the blinding lights of oncoming traffic (even on dim) some of the later model vehicles with LED headlights, I personally have to concentrate to the right side of the road or I totally lose vision. I have a 2017 Ford vehicle and upon meeting oncoming traffic they constantly blink their lights at me thinking my lights are on bright when in fact they're on dim, I know if I flash them I'll blind them so I try not to do it unless they continue to do so at me.

B.584 January 28, 2019 — Saint Peters, United States

Debra Schnyder

B.585 January 28, 2019 — San Antonio, TX

LED lights are blinding! I swear people were driving around with their brights on. These lights can't possibly be good for eye sight.

B.586 January 28, 2019 — Tacoma, WA

https://m.facebook.com/groups/304594800386308?view=info&refid=18&ref=bookmarks

B.587 January 28, 2019 — Warerville, OH

Twice in the past week I was almost involved in accidents due to these lights. One because a car behind me had them and their glare off my side mirrors made it difficult to see the road in front of me. Another time another driver drove off the road and I almost hit him. When I stopped to help he told me the headlights of a Lincoln caused him to crash.

B.588 January 29, 2019 — Hawk Point, MO

When these cars are coming at you it is almost impossible to see through the lights and you are temporarily driving blind

B.589 January 29, 2019 — TX, United States

I was almost in an accident when making a left hand turn because the car across from me at the stop light had such BLINDING lights (not adjusted, not facing the road, but straight ahead so as to be dangerous) that I temporarily couldn't see the road. When the lights are on oncoming traffic, they are horribly dangerous. I am not alone in my complaint with this. The drivers with the ultra-bright lights can see fine, but it is inconsiderate and downright dangerous to other drivers who have to share the road. These lights are worse than a car having their "high beams" on.

B.590 January 29, 2019 — amelia, OH

I want to see at night not to be blinded by the light

B.591 January 30, 2019 — Phoenixville, PA

The new trend of blindingly bright headlights over the last few years is making it harder for other drivers to see at night.

B.592 January 30, 2019 — Rush, NY

These lights are blinding creating very dangerous situations! After being blinded by the light, it's hard to see the road, deer about to cross, etc.

B.593 January 31, 2019 — Riverside, CA

We recently traveled and drove during the night, the blinding lights made it very dangerous, it was very difficult to see the upcoming traffic and the lines on the road

February 2019

B.594 February 1, 2019 — Houston, TX

My eyes are being damaged by these uneccesary blinding headlights

B.595 February 1, 2019 — Lancaster, TX

I'd like to get home safely without being blinded by overly bright headlights as I'm sure others would too.

B.596 February 1, 2019 — Philadelphia, PA

It is blinding! I have been thinking that people are just insensitive lately and must all the sudden be driving with their high beams then thinking something must be wrong with my eyesight since all of the sudden everything appears to be so blinding only to find out that it's not me that people are now driving with these high powered lights which are blindingly dangerous. The blue lights are the worst offenders. Please ban use of the blue lights and even the high powered yellow lights (I am not talking abought high beams) or find some way to make them safe for the public as this is becoming a real danger to society especially on highway driving at night. Furthermore the law should be targeted at the manufacturers of these, auto shops, and mechanics so that they will know not to sell or install these lights for the average person thereby reducing the chance someone will use them knowingly or unknowingly. Please address immediately!

B.597 February 1, 2019 — blauvelt, NY

The lights are blinding my vision

B.598 February 2, 2019 — London N89HN, ENG, United Kingdom

These bright headlights (and even tail lights too) make night driving a nightmare.

B.599 February 3, 2019 — Birmingham, AL

I have very light blue eyes and these headlights cause actual pain when they shine on my face at night. It makes driving at night dangerous.

B.600 February 3, 2019 — Broadstairs, ENG, United Kingdom

Led lights are too bright and a health and safety hazard

B.601 February 3, 2019 — Pescadero, CA

These headlights cause glare disability and temporarily blind drivers in oncoming traffic. Eliminate the blue-rich white headlights and use warmer temperature colors such as amber.

B.602 February 3, 2019 — Providence, RI

This really is a big safety issue, and these lights don't belong on the roads.

B.603 February 3, 2019 — Tacoma, WA

#banblindingheadlights

B.604 February 3, 2019 — West Babylon, NY

I drive from Suffolk County to Queens and back again every day to and from work, most of the time in the dark. The newer headlights are downright blinding in the rearview and side mirrors. To make matters worse, the city and counties have begun switching the amber streetlights to bright white blinding lights that hurt my eyes and make actually seeing the lines in the roadways (or lack thereof, especially on Queens Blvd and Union Turnpike) virtually impossible. Please reconsider a better alternative, as these bright white lights are blinding drivers and I'm just waiting for the accidents to happen. I really do not want to be one of them.

B.605 February 3, 2019 — selkirk, NY

I'm going to get in an accident if they don't ban these high intensity lights!

B.606 February 4, 2019 — cambridge, MA

The new headlights are endangering oncoming traffic. They are simply blinding.

B.607 February 4, 2019 — villas, NJ

These lights are blinding

B.608 February 5, 2019 — Michigan City, IN

I'm signing because these lights are terrible for drivers and the environment. We had to fight to get these lights turned away from our house when a new government building went up next door. Thankfully, we had a community rep that took action for us.

B.609 February 5, 2019 — Tijeras, NM

I literally cannot see when LED headlights coming toward me on a dark rural road.

B.610 February 6, 2019 — Lindenhurst, IL

These lights trigger my migraines making it dangerous for me to drive!

B.611 February 6, 2019 — Minneapolis, MN

I, too, often have trouble seeing at night with these very bright lights. I have thought people are driving with their him beams on

B.612 February 7, 2019 — Cross Roads, TX

It's damaging eyes and we can't see while we're driving there is nothing good about led hid headlights. We had it right for so many years. Why do they change it for no reason. We need to start a Class Action lawsuit against the Government, dot, and the automobile makers. We need to hire some good lawyers. That is the only way to get change. These terrible lights are not even close either. They are like 300 times to bright and I think the rays are too sharp too. So the entire style of the light is just Criminal. Sometimes I feel like getting a green laser and shining it right back at the on coming violator to teach them a lesson. I will never buy one of these new junky poorly designed cars. I drive a 2004 GMC Sierra and its just fine and the Lights are normal.

B.613 February 7, 2019 — Cross Roads, TX

We need to All Start a Big Class Action lawsuit. This is rediculous that this has happened. Some idiot that have no sense or cooth is the one that put these on all the cars. Actually it was obama. I

remember a speech of his saying he wanted all cars to go to LED's in the future. He is such an idiot. led technology and it's waves and rays are say to intense and sharp. It's criminal. It's assault.

B.614 February 7, 2019 — Cross Roads, TX

We need to All Start a Big Class Action lawsuit. This is rediculous that this has happened. Some idiot that have no sense or cooth is the one that put these on all the cars. Actually it was obama. I remember a speech of his saying he wanted all cars to go to LED's in the future. He is such an idiot. led technology and it's waves and rays are say to intense and sharp. It's criminal. It's assault.

B.615 February 7, 2019 — Cross Roads, TX

We need to All Start a Big Class Action lawsuit. This is rediculous that this has happened. Some idiot that have no sense or cooth is the one that put these on all the cars. Actually it was obama. I remember a speech of his saying he wanted all cars to go to LED's in the future. He is such an idiot. led technology and it's waves and rays are say to intense and sharp. It's criminal. It's assault.

B.616 February 7, 2019 — Cross Roads, TX

We need to All Start a Big Class Action lawsuit. This is rediculous that this has happened. Some idiot that have no sense or cooth is the one that put these on all the cars. Actually it was obama. I remember a speech of his saying he wanted all cars to go to LED's in the future. He is such an idiot. led technology and it's waves and rays are say to intense and sharp. It's criminal. It's assault.

B.617 February 7, 2019 — Cross Roads, TX

I have blue Eyes too and the rays are sharp and intense. I can actually feel them hit me. I think it pretty much equally affects people with green and brown eyes too. We need to protest at Capitol hill also we all need to start a Class Action Lawsuit.

B.618 February 7, 2019 — Cross Roads, TX

yes even the tail lights and blinkers are WAY too BRIGHT. It's the type of ray it used. the LED's are just bad and probably invented by Satan or obama.

B.619 February 7, 2019 — Cross Roads, TX

It's Criminal. These lights are not even close. It's like someone was going out of their way to make everything LED HID. That is a bad technology all together and a dangerous one. It's assault.

B.620 February 7, 2019 — Cross Roads, TX

Me too. It's insane. I think it's so rediculous that some one did it on purpose to hurt people. I do remember obama in a speech about 6 years ago saying that he wanted all cars to go to LED HID lights. He's such an idiot.

B.621 February 7, 2019 — Cross Roads, TX

Thank Obama for it. He preached and ordered all car makers and truck makers to have LED HID lights. LEDs are the same tech used to make those green lazer pens that are illegal to shine. Except they just make it White, Yellow or Bluish White and they aim it in a cone instead of one line. Its' the exact same thing though. This is Illegal what the government is doing to the People.

B.622 February 7, 2019 — Cross Roads, TX

They can even cause permanent or more serious damage which we don't really like talking about. This is probably the worst problem that has ever happened in USA history probably worse than slavery because that really only affected like 5 % of the population.

B.623 February 7, 2019 — Cross Roads, TX

It actually hurts. The Trucks have lights that are like 1000 lasers. It hurts my eyes and is affecting them. Can we forward this to Donald Trump to make an Executive order and fix this rediculous obama crime he's done on everyone.

B.624 February 7, 2019 — Cross Roads, TX

democrats did this and they have no common sense and they hate people. Litterally this is an obama policy.

B.625 February 7, 2019 — Cross Roads, TX

I used to love driving at night. Now it's just rediculous and there is nothing that can be done other than the government needs to step up big time and fix this terrible problem that obama and his minions caused. This is criminal and they did it on purpose. everyone already knew that led sucks even on flash lights. Those whitish blue flash lights that they were pushing at cheap stores (I never bought one Cause I have good taste and can tell when something is junk but others bought them and would take them camping) Everyone knew those flashlights were garbage.

B.626 February 7, 2019 — Cross Roads, TX

LEDs HIDs are GARBAGE!!!!!

B.627 February 7, 2019 — Cross Roads, TX

They are WAY WORSE. They use laser technology. Oh no I said the magic word to a millennial "technology" now all the millennials wil coming running saying how awesome and hip they are. That is the problem. millennials don't complain about the things that matter. They love and accept any kind of new electronic even if it's garbage.

B.628 February 7, 2019 — Philadelphia, PA

Led headlights screams "I'm a douchebag"

B.629 February 7, 2019 — San Jose, CA

headlights are bad

B.630 February 8, 2019 — Tacoma, WA

We are getting closer and closer to that magic number 5000 signatures! I wonder what happens when it hits 5000.

B.631 February 9, 2019 — East Troy, WI

As a chronic sufferer in general, I couldn't tell you how many times I've been given migraines after being blinded by LED headlights.

B.632 February 9, 2019 — Fairbanks, AK

These blinding lights killed and will kill thousands and hundred thousands of people. We need to stop this madness.

B.633 February 9, 2019 — United States

They, re annoying and dangerous

B.634 February 9, 2019 — Vancouver, WA

I have personally experienced dangerous blinding, inability to safely stay on my side of the road, and even turned off of road too quickly and ended up in a culvert due to the intensity of the overly bright LED and/or HID headlights.

B.635 February 11, 2019 — Fall River, MA

I'm signing this petition because blinding headlights cause epileptic seizures. And rather the car is fully equipped, or motified by owner. They are causing serious harm to those who have epilepsy.

B.636 February 11, 2019 — San Francisco, CA

I've literally had to come to a complete stop because light from oncoming cars was so bright I couldn't see the road. They're a menace!

B.637 February 11, 2019 — San Francisco, CA

As a bicyclist, I agree that LED lights should only be so bright as traffic signals on automobiles so not to blind other drivers and others on the road. However, I rely on LED lights on my bicycle to be seen. I do not believe my bicycle lights go beyond the brightness of traffic signals.

B.638 February 13, 2019 — Saint Louis, MO

I'm sick of the blinding lights. No reason for them!!

B.639 February 14, 2019 — Tacoma, WA
We are getting so close to 5000 signatures I can taste it! Come on, people, sign that petition! Share that petition! Ban Blinding Headlights!

B.640 February 15, 2019 — Mansfield, OH
Lights are blinding

B.641 February 15, 2019 — Tacoma, WA
https://m.facebook.com/groups/304594800386308?ref=bookmarks

B.642 February 15, 2019 — Vineyard Haven, MA
It's obvious. These lights are blinding.

B.643 February 16, 2019 — Carrog, WLS, United Kingdom
These lights are a danger on our roads, please ban them.

B.644 February 16, 2019 — erith, ENG, United Kingdom
I don't want to go to jail because of somebody else's bad design.

B.645 February 19, 2019 — Durant, OK
I hate these lights - they make driving dangerous.

B.646 February 19, 2019 — Tacoma, WA
#banblindingheadlights

B.647 February 19, 2019 — cleveland, TN
I suffer from migraines and these lights st night are a serious trigger when I am driving!

B.648 February 20, 2019 — Hensley, AR
It's an absolute FACT, the intensity from these headlights not only temporarily blind for some drivers but also migraines with visual aura. The light feels like a laser. As for the street lights, I describe the most common ones as glare bombs, no matter what "color" they are. They are excessively too bright, with a glare the most offensive attribute. I am a lighting professional that is confident with my justified reasons for signing this petition. The healthcare professionals - neurologists, optometrists along with the lighting manufacturers, designers need to have a conversation with the actual people who are affected.

B.649 February 20, 2019 — Hensley, AR
Thank you for signing!

B.650 February 20, 2019 — Hensley, AR
Thank you for signing!

B.651 February 20, 2019 — Hensley, AR
Thank you for signing!

B.652 February 20, 2019 — Hensley, AR
Thank you for signing!

B.653 February 20, 2019 — Hensley, AR
Thank you for signing Al

B.654 February 20, 2019 — Picayune, MS
Same problem can't drive at night anymore because of this.

B.655 February 20, 2019 — Pittsburgh, PA
Blinding headlights are a dangerous.

B.656 February 20, 2019 — Saint Louis, MO

I'm a migraine sufferer.

B.657 February 20, 2019 — Tacoma, WA

#banblindingheadlights

B.658 February 20, 2019 — Tacoma, WA

https://m.facebook.com/groups/304594800386308?ref=bookmarks

B.659 February 20, 2019 — Tacoma, WA

Thank you, Melissa

B.660 February 20, 2019 — Tacoma, WA

Ban the fuck out of them!

B.661 February 21, 2019 — Butler, PA

Blinded by the light of the headlights and the roadside signs that are being put up.

B.662 February 21, 2019 — Myrtle Beach, SC

And people with these headlights will say just look at the line on the road. Nah duh. I can't see the line when you have the sun on the front of your car

B.663 February 21, 2019 — Paia, HI

I have to turn my bright lights on when those cars approach me, so it's dangerous for those drivers as well. at times I cant see anything so I just follow the speeding traffic in front of me and somehow manage not to crash into anything. true story I'm not joking. I'm also driving less in the evenings because of it.

B.664 February 22, 2019 — BRONX, NY

save a life

B.665 February 22, 2019 — Charles Town, WV

The issues that are even larger than simply having OEM installed xenon or LED headlights is the positioning of the lights themselves. There is no federal standard for maximum headlight height, large vehicles should have a maximum height off the ground headlights are allowed to be designed into the vehicle. Additionally, the inexpensive aftermarket pieces that people are adding to their vehicle are absolutely ridiculous and the biggest part of this nationwide issue! For $50 someone can go on eBay or Amazon and buy a xenon light kit and install it into their non-factory equipped xenon headlight housings (which is 100%" illegal to do). This creates very bad scatter, glare and poor illumination, even for the driver. also, where I live, people drive around with off road light bars and spotlights turned on, even on city streets or one the highway, that is just uncalled for and ignorant.

B.666 February 22, 2019 — Fond du Lac, WI

I, too, get blinded by these lights. It actually HURTS my eyes. Perhaps these drivers can now see for miles ahead of them. However, everyone coming TOWARDS you can see nothing at all. Think about that.

B.667 February 22, 2019 — Orlando, FL

I'm tired of being blinded by headlights as I drive

B.668 February 22, 2019 — St Louis, SC

LED headlights are painful and dangerous!

B.669 February 22, 2019 — St. Cloud, FL

I can't drive at night now because it's I can't see with these bright headlights. It's not necessary.

B.670 February 24, 2019 — Davis, CA

I agree that these blinding lights are not necessary and are even dangerous! What happened to the times when people were considerate of others by dimming their "bright lights" when ANY oncoming

vehicle was visible? I also agree that the angle of truck lights are even more blinding especially if one is in a car that sits a bit lower. I plan to keep looking for options to make our opinions heard by car manufacturers, legislators and law enforcement!

B.671 February 25, 2019 — Australia

I've noticed that it's much more difficult driving at night than it used to be, and more dangerous. Modern headlights are too bright.

B.672 February 25, 2019 — Dayton, OH

I now have to turn my mirrors down so I'm not blinded by the cars behind me let alone the cars in front of me!

B.673 February 25, 2019 — Tacoma, WA

LED and HID headlights are hazardous!

B.674 February 27, 2019 — Algonac, MI

They are a big safety hazzard.

B.675 February 27, 2019 — Alice, TX

I believe these lights are unsafe and should be banned.

B.676 February 27, 2019 — Chicago, IL

I have an astigmatism & I suffer from migraines. The excessively bright headlights are painful & potentially dangerous for me.

B.677 February 27, 2019 — Romeoville, IL

They hide behind the apron strings of some loophole, but their 'right' to them ENDS when the safety of the public (let alone my family and myself) is involved.

B.678 February 27, 2019 — San Francisco, CA

Clearly I am not the only one who has experienced this distraction.

B.679 February 27, 2019 — santa fe, NM

it's a matter of saving lives

B.680 February 28, 2019 — Chicago, IL

Bright blue-white blinding lights in headlamps or streetlights is dangerous. This needs to end.

B.681 February 28, 2019 — Kenosha, WI

I'm on the roads at night a lot. Nine out of ten refuse to dim bright headlamps.

March 2019

B.682 March 1, 2019 — Rivalta di Torino, Italy

Alcuni dei nuovi fari a LED provocano abbagliamento e sono pericolosi

B.683 March 1, 2019 — Sarzana, Italy

Le luci led freddissimo sulle autovetture e autocarri abbagliano molto nel buio della notte causando una parziale impossibilità di guidare in sicurezza per qualche tempo.

B.684 March 1, 2019 — Tacoma, WA

people are even blinding me during daylight hours with Daytime running lamps that are laser bright! WTF? SERIOUSLY

B.685 March 3, 2019 — Oakville, WA

I'm tired of coming home from work and these new extra bright headlights completely blinding me and I have to slow down and even sometimes pull over to avoid wrecking.

B.686 March 4, 2019 — Medford, OR

The new lights are just too bright and should be banned for safety reason!

B.687 March 4, 2019 — United States

headlights now are blinding and causing dangerous driving

B.688 March 5, 2019 — Clarkston, MI

These lights are horrible and make it extremely difficult to see when driving.

B.689 March 5, 2019 — Clarkston, MI

I am signing because I have been temporarily blinded by these headlights both from oncoming traffic and from the glare caused in my rear-view mirror from a vehicle behind me.

B.690 March 5, 2019 — Wilmington, United States

These headlights are way too bright. They are blinding either behind you or especially coming toward you.....they are dangerous and a safety hazard. There should be a li.it on how bright they can be.....hey!! Like they used to be and we all could see just fine!!

B.691 March 6, 2019 — New Rochelle, NY

Totally agree 100% with this petition. I am literally BLINDED now at night - both as a pedestrian and a driver. I now HATE driving, and even walking around at night. The daytime running equivelants are also just as bad, ruining the “peace” and aesthetic of walking about in the day while not bringing any safety improvements. These ridicuolously bright blinding lights need to be reigned in - and quickly...

B.692 March 6, 2019 — New Rochelle, NY

“it was obama”.. LOL. amazing what you brainwashed republican trolls will do to inject your divisive hate speech everywhere. This is happening EVERYWHERE! pushed by the auto manufacturers and most countries outdated legal standards that only define light intensity as “wattage” and not “lumens”. Go look it up and take your divisive trolling elsewhere...

B.693 March 6, 2019 — San Diego, CA

These headlights are distracting, blinding, and painful!!!

B.694 March 6, 2019 — Sylacauga, AL

I have astigmatism and they blind my vision.

B.695 March 7, 2019 — La Grange, IL

This is crazy! Beam the lights properly on the road, not into outer space!

B.696 March 7, 2019 — Melbourne, FL

Feels like eternity when one is blinded by LED headlights, as ones car continues to move forward but the driver can’t see anything. The recovery time from the glare is too long. Even looking to the very edge of the white line away from the lights does not work. It’s scary. I just returned from a short drive home and was blinded by 4 SUVs that sit higher than my own SUV. I was so enraged, I figured I can’t be the only one who has trouble with LED light, that a quick google search revealed I am not alone. Please support banning LEDs that are brighter than traffic signal. Please also push to enforce proper height adjustments to headlights.

B.697 March 7, 2019 — Melbourne, FL

It’s a scary feeling when your car is moving forward at whatever speed but you, the driver, can’t see a thing because you have been blinded by LEDs of oncoming traffic, especially those of SUVs and other lifted trucks. Seconds feel like eternity when you are blinded.

B.698 March 7, 2019 — Thorpe Market, ENG, United Kingdom

Stop this dangerous practice

B.699 March 10, 2019 — Tacoma, WA

We're almost to 4900! We need 5000!

B.700 March 11, 2019 — Chillicothe, OH

I am signing this because 1. They are blinding and I would venture to say most people are driving with their highbeams on so they can see the road in front of them vs looking down at the ground, because the radius of the beam is so small on low-beam. 2. You might as well be driving with 2 flashlights on the front bumper for as useless as these lights are at night, other than people being blinded by them! Why would anyone need lights this bright while driving???? It's crazy!

B.701 March 11, 2019 — Enfield, ENG, United Kingdom

I'm badly affected by the effects of l.e.d lights when I drive at night not only on main roads but particularly when I have to drive through wooded areas where large cars use they're beams and redirect them too late.

B.702 March 11, 2019 — Maple Heights, OH

The new headlights are dangerous. It always appears as highness are on. The lights are blinding.

B.703 March 11, 2019 — Milwaukee, WI

These oncoming lights are TOO BRIGHT making it dangerous to drive at night.

B.704 March 11, 2019 — Oklahoma City, OK

Jennifer Sloan

B.705 March 11, 2019 — Worthing, ENG, United Kingdom

Literally just got blinded on my way home this evening by several cars on a dark Road. I had to pause driving because I genuinely couldn't see the road in front of me for the brightness. Made me so cross!! This has to stop!

B.706 March 12, 2019 — CAMPBELL HALL, NY

LED Light bars coming at a driver are way too much to overcome when driving. Also, emergency lighting on cop cars is way over the top and creates a hazard when approaching and potentially obscure the scene.

B.707 March 12, 2019 — Neenah, WI

I had a truck with what seemed like the whole front end was "lighted" so bright that I was totally blinded. Don't know if aftermarket lights were added, but I DO know his high beams were NOT on...at first, because he flashed them back at me (in a tiny Geo Metro!) when I flashed my brights at him. Somehow we both survived, but it was a polarizing moment. Since, other vehicle extremely bright lights in other settings have reinforced my belief that these bright lights are dangerous and in spite of "claims" they are carefully engineered and fall within the established standards, I can't believe they can. I have a Outback and a Silverado, both are newer and have pretty bright lights, but I have no complaint about those, and I HAVE experienced both approaching me at night - without being blinded. Car manufactures are claiming their new led lights illuminate a significant percentage better than the older ones, but they also want you to believe "brighter" doesn't blind oncoming drivers. Which I call "b.s." I'm done with my rant for now.

B.708 March 12, 2019 — Tacoma, WA

90 sigs to go!

B.709 March 13, 2019 — concord, NC

I have to wear special blue light blocking tinted glasses at night and I'm still getting blinded from front and back by drivers every night. I have had to completely stop my vehicle, because the driver coming at me wouldn't dim there bright HID lights or maybe they couldn't be dimmed. It's much worse for older people, I understand.

B.710 March 15, 2019 — Chicago, IL

I signed because I have a special love for my retinas and would like for them to last the rest of my life.

B.711 March 15, 2019 — Middletown, CT

I'm a teenage driver who drives a low car (Toyota Camry '05) and I cannot see when any car driving by has LED headlights. They are especially blinding on bigger cars since my head is right at the level of their headlights. I've taken to playing a game guessing whether it's a person with high beams on or LED lights since they're so similar. This blinding effect lasts long after the car has passed and is a danger to everyone. If I look at the edge of my line I cannot see if anything jumps out in front of my car, and it does little to help me see.

B.712 March 15, 2019 — Middletown, CT

* edge of my lane

B.713 March 17, 2019 — Los Angeles, CA

As a doctor of optometry, I fully endorse this petition.

B.714 March 18, 2019 — Soquel, CA

the lights are just too bright, like looking at a blue sun ray.

B.715 March 18, 2019 — Tacoma, WA

4997! Only need 3 more to hit 5000! When that happens, what happens? Will they be banned? Or will people still be allowed to drive around blinding everybody?

B.716 March 19, 2019 — Orlando, FL

I'm only in my 30's and these lights literally blind you in the road especially at night. I also see people turn them on in the day I have no clue why. Something should be done about this. God feels like a UFO when someone has those beem lights behind you.

B.717 March 19, 2019 — Secaucus, OH

It's so annoying seeing these sorts of headlights, it honestly terrifies me

B.718 March 19, 2019 — Tacoma, WA

OK, What was the point of telling us we need 5000 signatures if now the number is being raised to 7500? I'm guessing at 7500 they will say we need 10,000. Then it will say we need 15,000! What is the actual number we need to BAN BLINDING HEADLIGHTS? 100,000? 500,000? 1,000,000?

B.719 March 19, 2019 — Tacoma, WA

looks like change.org is ignoring our 5000. they raised the bar to 7500, which then will probably go higher and higher! Try this other petition! #banblindingheadlights https://petitions.moveon.org/p/l_azY_5L9e

B.720 March 19, 2019 — Tacoma, WA

#banblindingheadlights

B.721 March 20, 2019 — Mt. Morris, IL

I don't like those! They blind you at night

B.722 March 21, 2019 — Hampshire, IL

It is the best time for us to watch the news and we liked the anchors & weather person.

B.723 March 21, 2019 — Tacoma, WA

Lets get 25 million signatures! Then we will only need 75 million to reach the next goal!

B.724 March 23, 2019 — Anishinaabe Aki, MI

Holy shit get rid of these lights! They are dangerous.

B.725 March 23, 2019 — Anishinaabe Aki, MI

Light pollution. Obviuosly something created to harm the natural state of things. Not good for humans, our 4 legged friends, or any other species. I refuse to drive at night because of these toxic lights.

B.726 March 23, 2019 — Commerce charter Township, MI

Enough is Enough! Stop ˜the blinding headlights!!! Let's save some lives, especially when driving at night!!!!

B.727 March 23, 2019 — Macomb, MI

Driving at night is a nightmare with these lights. How many deaths will it take before they are banned?!

B.728 March 24, 2019 — McMinnville, TN

If it is illegal for us to drive with our bright headlights on and LED′s are brighter, why is it legal for LED′s? It′s just common sense folks.

B.729 March 25, 2019 — Bayville, United States

Because blinding headlight can danger

B.730 March 26, 2019 — Barrow upon Soar, ENG, United Kingdom

These high intensity headlights are dangerous, meaning oncoming drivers can be totally and painfully blinded for several seconds. Nighttime pedestrian injuries are increasing because of driverss being blinded.

B.731 March 26, 2019 — Forestville, NY

These lights are too bright. On coming traffic is blinded by such bright lights. Not necessary, and very dangerous.

B.732 March 26, 2019 — rochester hills, MI

Its hard to see the road when you have flood lights in your face.

B.733 March 27, 2019 — Australia

Night driving has become much more unpleasant and dangerous than it needs to be. I try to avoid it more than I used to, which makes me reluctant to go to events in down.

B.734 March 27, 2019 — Snover, United States

These lights signicantly decrease my ability to drive safely at night!

B.735 March 27, 2019 — Utica, MI

These lights are a hazard.

B.736 March 27, 2019 — Utica, MI

Luanne M. Easton

B.737 March 28, 2019 — United States

I have experience the distraction of this light. It is annoying and very distractful .

B.738 March 28, 2019 — Wallington, NJ

I have been blinded from as far away as 3 blocks so many times its not even funny. there are times where they are behind or in front of me and I cant see the road as im driving. inside my vehicle is like broad daylight very often. they are too bright. jeeps seem to all have these lights.

B.739 March 29, 2019 — New York, NY

They are extremely dangerous to on coming traffic

B.740 March 30, 2019 — Anderson, IN

Bright headlights can trigger seizures in people with photosensitive epilepsy.

B.741 March 30, 2019 — Murchison, TX

I have photosensitive with my generalized inactable epilepsy. Bright lights at night sends me into a grandmal seizure

April 2019

B.742 April 1, 2019 — Opp, AL

I had to have brain surgery due to photosenitive epilepsy. Bright headlights would cause me to have seizure. YES! Ban the bright headlights!!

B.743 April 4, 2019 — Tacoma, WA

Listen to BLINDED BY HEADLIGHTS by Jeff Alan Fowler #np on #SoundCloud https://soundcloud.com/jeff-alan-fowler/blinded-by-headlights

B.744 April 5, 2019 — Detroit, MI

I urge continued support for this petition to succeed.

B.745 April 6, 2019 — Davis, United States

I want all glary LED lights banned completely. There needs to be class action law suits against the manufacturers for making dangerous products - street lights, car lights, porch lights, motion detecting seizure/migraine inducing etc etc. The global roll out of these horrible lights without regard to sensitive receptors like migraine and epilepsy patients is one of the biggest scams of the century. Ban them now!!

B.746 April 8, 2019 — Beaverton, OR

Dramatically impacted with sudden loss of vision whether seen in oncoming traffic or the rear view, I am adding my signature to thousands of others who have experienced the dangerously blinding glare of the HID headlights. We are asking that all blue light technology be banned on behalf of the lives of citizens across the country. The AMA stated that blue-rich light causes pain and damage to the human eye and suppresses melatonin at five times the rate of other wavelengths. They have urged people to move lighting toward the more natural and warm red-end of the spectrum. We are asking Congress, the Department of Transportation and NHTSA to take this matter seriously and ban all blue-light technologies on vehicles and to keep tail-lights, brake-lights and turn signals to a maximum brightness no greater than that allowed for traffic signals. Kathryn Thomas, B.S.N, M.A.E.T. Nursing Professor and Adjunct Linfield-Good Samaritan School of Nursing Potrland, Oregon

B.747 April 9, 2019 — Lake City, TX

I'm signing because the new ford truck is running four headlights on the low beam button. If you flash them you can't tell the difference when they flash back with their high beam. I cannot believe that this has been accepted through the safety council.

B.748 April 12, 2019 — Munster, IN

Makes it hard to see anything other then those damn headlights.

B.749 April 14, 2019 — Floyds Knobs, IN

The use of binding headlights are a danger to the public and on the public highways across America. These lights will cause more wrecks on the highways and be a detriment to everyone.

B.750 April 19, 2019 — Omaha, NE

Every night on my 15 minute drive home from work, I have to slow down, (sometimes stop completely), look toward the right curb, and hold my hand in front of my face to not be blinded at LEAST 10-15 times. I don't understand why, but the problem seems to be getting worse. Being blinded while driving is not only SO dangerous, it has caused people to drive off the road, but is also enraging, causing blinded drivers to then retaliate by turning on their high beams, increasing the danger of the situation. Why is it legal for these companies to make and sell aftermarket HID kits? There are actually studies proving that they do not improve the driver's visibility, but actually decrease distance of visibility and cause the driver's pupils to dilate, limiting their peripheral vision. (http://www.danielsternlighting.com/tech/bulbs/Hid/conversions/conversions.html.) These companies should be forced to stop creating and benefiting from this

incredibly inconsiderate safety hazard, and law enforcement should enforce the safety of the public by citing these aftermarket-HID-installing-drivers.

B.751 April 19, 2019 — Omaha, NE
Yes! They are actually physically painful to my eyes too!

B.752 April 19, 2019 — Omaha, NE
I do feel instant physical pain behind my eyes when being blinded by these types of headlights, even when holding my arm up to block the light from my eyes, and it is enraging.

B.753 April 19, 2019 — Omaha, NE
The aftermarket ones that people put on their cars are not legal at all.

B.754 April 19, 2019 — Savannah, MO
It is dangerous and impossible to see. When these bright lights come into view I have to squint or sometimes entirely close my eyes.

B.755 April 21, 2019 — Mandeville, LA
I've almost wrecked multiple times because of LED headlights on other cars

B.756 April 24, 2019 — Tacoma, WA
We still need signatures! 500,000 to get to the next level!

B.757 April 29, 2019 — MA, United States
You can't tell if the driver passing by you put them on low beam.

May 2019

B.758 May 2, 2019 — Newcastle upon Tyne, ENG, United Kingdom
The blue-white colour temperature of modern headlights is a serious problem for blinding oncoming drivers, pedestrians, and for light pollution. Let's find a sensible level.

B.759 May 7, 2019 — Middletown, CT
I get migraines so my eyes are very sensitive to these.

B.760 May 8, 2019 — Nacogdoches, TX
Lifetime Migrainer!! These lights blind me and give me migraines!!

B.761 May 13, 2019 — West Orange, NJ
They are blinding head on andx in mirrors, I don't see any benefit, really do not see any better then you did with the older style lights, they do not improve road vision

B.762 May 17, 2019 — Bountiful, UT
It is breaking the law, and my eyes.

B.763 May 17, 2019 — Spanish Fork, UT
Brooke Brailsford

B.764 May 17, 2019 — West Valley City, UT
Headlights are much brighter now, as well as some brake lights.

B.765 May 18, 2019 — Battletown, KY
I'm signing this because my mom has seizures everytime she sees these led lights, so therefore she can't drive at night.

B.766 May 18, 2019 — Birmingham, AL
There is no need to be able to see into space. If I am blinded by your headlights and you're more than 50 feet away... unnecessary.

B.767 May 18, 2019 — Boynton Beach, FL
They hurt your eyes and serve no real purpose in normal driving conditions!

B.768 May 18, 2019 — Dothan, AL
Because it's dangerous

B.769 May 18, 2019 — Endicott, NY
These lights are blinding duh!!!!

B.770 May 18, 2019 — GULF BREEZE, FL
I drive to work in the dark and have had to pull over and let someone pass because they were blinding me. My husband hit a deer because someone going the other direction blinded him and he didn't see the deer.

B.771 May 18, 2019 — Gulf Breeze, FL
I have a problem seeing

B.772 May 18, 2019 — Las Vegas, NV
Headlights are too bright, people have them on low beam and looks like they are on HIGH. It's glaring and it hurts your eyes.

B.773 May 18, 2019 — Marseille, France
These lights are a hazard.

B.774 May 18, 2019 — Milton, FL
LED lights are dangerous when coming at me on the highway.

B.775 May 18, 2019 — Milton, United States
Blinding LED headlights have no place on our highways or city streets; no wonder so many pedestrians are accidentally hit! What are auto manufacturers thinking??

B.776 May 18, 2019 — Milton, United States
Unfortunately, those yellow glasses are useless for many people—I've tried 2 kinds, both useless…

B.777 May 18, 2019 — Murfreesboro, United States
LED lights are so dangerous, esp. on the two lane back roads with no guard rails. They blind oncoming traffic to the point of not being able to see where center line or outer edge of road is located. Too many Have already lost their lives because of these LED lights. They, in my opinion, need to be banned. I used to have 20/20 vision, but not anymore

B.778 May 18, 2019 — Navarre, FL
Drivers safety is first

B.779 May 18, 2019 — New Castle, PA
These lights are extremely bright making visibility nearly impossible when a coming at you

B.780 May 18, 2019 — Northport, AL
I am so afraid to drive at night because of the terrible glare that comes with these bright lights. When I do, I have to put on my brakes because I can't see the road and then I'm afraid someone is going to hit me from behind.

B.781 May 18, 2019 — Pensacola, FL
I got eye problems yo

B.782 May 18, 2019 — Pensacola, FL
I have almost been driven off the roads numerous time because of the lights being so bright it's much harder to see.

B.783 May 18, 2019 — Puyallup, WA

I hate driving at night. The glare from headlights is very distracting. I hate trucks that have them. Up higher, right in your rearview mirror or eyes!

B.784 May 18, 2019 — Rochester, NY

I have been blinded and almost got hit head on because of those lights. My son was driving and was blinded by those lights and almost ran a stop sign which would have ultimately ended up in an accident since there was a car coming that had no stop sign.

B.785 May 18, 2019 — Rochester, NY

When these lights are coming toward you, especially at night, they are very distracting & make it difficult to see.

B.786 May 18, 2019 — Rochester, NY

Bright LED headlights make the street lines barely visible. It is dangerous and absolutely rediculous.

B.787 May 18, 2019 — Spartanburg, SC

Because I'm tired of being blinded while I'm driving.

B.788 May 18, 2019 — United States

The lights are blinding! They make it worse for drivers to be able to see.

B.789 May 18, 2019 — gillett, PA

rick bartlow

B.790 May 18, 2019 — milton, FL

These lights are way to bright and cause people to not be able to see

B.791 May 18, 2019 — rogue river, OR

I have to wear yellow glasses in order to drive at night because of these blue headlights.

B.792 May 19, 2019 — AL, United States

I have had several near misses due to the blinding led/hid lights

B.793 May 19, 2019 — Anthon, IA

I have migraines and these lights are excruciatingly painful to see coming toward me and impossible for me to keep my eyes on the road.

B.794 May 19, 2019 — Berry, AL

I have been blinded by them to the point where I've run off the road. Thank goodness for the treads on side of line that alerted me by the noise, bumping. If i had been on my motorcycle I'm sure i would have wreaked.

B.795 May 19, 2019 — Branchville, NJ

HID and LED lights are terrible! Sure they may make it easier for the person driving the vehicle to see, but when I approach that vehicle I can't see anything! These lights are not safe for other drivers!

B.796 May 19, 2019 — Carson, WA

I hate these led lights they have on cars these days. Yes the driver can see better but the other person can't see shit. You might as well tell everyone they can ride around with there brights on. I can't see anything except a tiny part of the white line when I pass a car with led lights. They look badass but I believe it causes a lot of wrecks. I know I've almost wrecked a few times passing a car with led headlights. All I could do is pray I make it past them cause I couldn't see shit. It's just not fair for the other drivers on The road to be blinded by these led headlights when it's dark and hard to see anyway. It's not Safe!

B.797 May 19, 2019 — Cashiers, NC

I can't safety drive at night anymore due to the fact that these headlights trigger a migraine. I literally have to pull over and get my boyfriend to drive or if no one is with me I have to stop and hope it passes quickly.

B.798 May 19, 2019 — Columbus, OH

The lights are so blinding it makes it unsafe to drive.

B.799 May 19, 2019 — Defuniak Springs, FL

I can't drive at night anymore cause these blind me and give me a blinding headache.

B.800 May 19, 2019 — Delphi Falls, NY

im signing cause they are to bright should be that way can cause a accident or the other driver might not see someone walking along the road or a deer coming out

B.801 May 19, 2019 — East Wenatchee, WA

They hurt my eyes and make me look away from the road or have to adjust my mirrors

B.802 May 19, 2019 — Elma, WA

They are dangerous. They are blinding.

B.803 May 19, 2019 — Emmett, ID

They are dangerous

B.804 May 19, 2019 — Eugene, OR

I am tired of being blinded by tall vehicles behind me and in front of me. It's hard on the eyes especially at night.

B.805 May 19, 2019 — Eugene, OR

I agree that these bright, newer headlights should be banned in every state. They are a major safety issue! Especially when a car is coming towards you in another lane. Also, when someone with those headlights is behind you it reflects on your rear-view mirror and when they are beside you and back a little ways it reflects on your side view mirrors and is blinding.. I've had times where I've had to pull over on the side of the road until that car has passed because the headlights were so bright. Something needs to be done about this.

B.806 May 19, 2019 — Grand Blanc, MI

Theses lights are dangerous!

B.807 May 19, 2019 — Kent, WA

Most of them are not at the right calibrated either and being too high. What blinds oncoming traffic!

B.808 May 19, 2019 — La Pine, OR

Yes, please because it's blinding especially when a person has light sensitivity. Almost had accidents a few times.

B.809 May 19, 2019 — Lacey, WA

I can't see crap when someone has these. I have had multiple almost wrecks because of them blinding me. So unsafe!

B.810 May 19, 2019 — Lakeville, NY

Hate them!

B.811 May 19, 2019 — Madison, AL

I have a real problem seeing to drive after I pass cars that have these blinding LED headlights.

B.812 May 19, 2019 — Manlius, NY

I dont like beening blinded by those coming towards me

B.813 May 19, 2019 — Maple park, IL

I drive home 5 nights a week, these lights blind me, sometimes making me see black dots like when you look at the sun they′re a danger

B.814 May 19, 2019 — Millinocket, ME

The LED lights are very blinding, especially to those of us that already have sight issues driving at night.

B.815 May 19, 2019 — Milwaukee, WI

These things are going to be the biggest safety concern next to impaired drivers this country has ever seen!

B.816 May 19, 2019 — Mount Bethel, PA

Hate Night Driving Because Of These Blinding lights!!!! These Will Cause Accidents!!! Outlaw Them!! !!

B.817 May 19, 2019 — Myrtle Point, OR

I deal alot with this situation. Even on low beam these headlamps are blinding. I believe they are a serious hazard to oncoming traffic. Myself and many others agree they should be banned!

B.818 May 19, 2019 — Myrtle point, OR

They are way to bright and are blinding!

B.819 May 19, 2019 — NC, United States

Christi Barrett

B.820 May 19, 2019 — North Syracuse, NY

They hurt my eyes and they are very distracting when coming at me.

B.821 May 19, 2019 — Orlando, FL

This is way too dangerous. Many times I have a hard time seeing the road

B.822 May 19, 2019 — Orono, ME

I have complained about these lights for years. It′s about time for something to be done about it.

B.823 May 19, 2019 — Pace, FL

Amen. Those bright lights are a danger. I despise them.

B.824 May 19, 2019 — Penfield, NY

I’ve been blinded by these lights! They don’t have to be that bright!

B.825 May 19, 2019 — Portland, OR

please ban these headlights. They are blinding to other drivers and they are dangerous for motorcyclists, pedestrians, and bicyclists because it is so difficult to see them while recovering from the glare.

B.826 May 19, 2019 — Portland, OR

Not only are these bright lights blinding to oncoming traffic, but the ″lifted″ pick up trucks make them even worse.

B.827 May 19, 2019 — Reedsport, OR

The new headlights make it impossible for me to drive safely at night. The glare obscures everything in my field of vision.

B.828 May 19, 2019 — Riverdale, UT

No one needs light that bright!

B.829 May 19, 2019 — Rochester, WA

It's about time someone did something about this! It's not only oncoming headlights that are blinding, but they also blind drivers when they shine in rear view and side mirrors, making it IMPOSSIBLE to see!

B.830 May 19, 2019 — Sandy, OR

When an oncoming car has its new LED lights on, I can't see! I love on a narrow windy road with drop off so that is dangerous! It's also blinding from behind.

B.831 May 19, 2019 — Seattle, WA

I've had issues with drivers running extremely bright headlights on U.S. 2 at night -- I work night shifts so I'm heading home at 3AM. I've had cases where the headlights were so bright that I could barely see the side of the road. It is a very serious safety risk. On top of that, HID light bulbs have a phenomenon that I call "color shift"...it shifts between warm colors and cool colors, and that actually can cause disorientation in drivers. I once had a truck behind me with HID's and they were glaring into my cabin, and I nearly drove off the road because of it. I want a return to Halogen spec lighting.

B.832 May 19, 2019 — Springfield, OR

I've thought for a long time that a lot of headlights were too bright these days.

B.833 May 19, 2019 — Sumter, SC

Headlights on newer cars are blinding. Emergency vehicle lights are even worse, those are the most dangerous for other drivers at night.

B.834 May 19, 2019 — United States

Why are these blinding white and blue lights even legal? It's illegal to drive around with high beams on, and it these should be illegal, too. They are even more blinding than high beams.

B.835 May 19, 2019 — United States

These lights are horrible!

B.836 May 19, 2019 — Waterford, MI

I can barely see the road with the lights so bright. My new teenage driver has same issue. Really scary.

B.837 May 19, 2019 — Zanesville, OH

Those lights are terrible on the eyes and I feel like it's dangerous!

B.838 May 19, 2019 — newark, OH

because those lights are ridiculously blinding to oncoming traffic!!

B.839 May 20, 2019 — Abilene, TX

Bright lights are dangerous for oncoming traffic

B.840 May 20, 2019 — Asheville, NC

It's dangerous all the way around. Some people have migraine triggers from these lights.

B.841 May 20, 2019 — Bishopville, SC

These lights are just to bright i have nearly been hit a few times because of people not being able to see

B.842 May 20, 2019 — Cicero, NY

I have been blinded many times by too-bright headlights and feel it's a very high risk danger

B.843 May 20, 2019 — Coos Bay, OR

I'm signing because the LED headlights are blinding and cause zero visibility at times.

B.844 May 20, 2019 — Eugene, OR

These LED lights are blinding and unsafe.

B.845 May 20, 2019 — Eugene, United States
I can not see the road when blinded by super bright lights at night.

B.846 May 20, 2019 — Fairport, NY
These lights are not helping, time to change them.

B.847 May 20, 2019 — Kent, NY
I can no longer drive at night because of these lights.

B.848 May 20, 2019 — Lennon, MI
I constantly have to stare at the white line on the side of road because many head lights are so bright. Glare, blindness, etc. I have to blink my eyes several times and weirdly I shake my head lol but many are crazy bright.

B.849 May 20, 2019 — Palmer, NE
Those lights kill my eyes so I try not to drive at night.

B.850 May 20, 2019 — Penfield, NY
I'm with you! I can't stand those lights

B.851 May 20, 2019 — Phelps, NY
I'm signing because this is very true. These lights are very bright and are more of a distraction to other drivers.

B.852 May 20, 2019 — Pittsfield, MA
I'm signing because I can't see when the car is coming at me, increasing my risk of an accident.

B.853 May 20, 2019 — Portland, OR
Not a frequent driver, but as a passenger and a pedestrian, the lights does hurt my eyes. As a deaf person, the eyes and the sense of sight is extremely important and i have to take good care of them.

B.854 May 20, 2019 — Poynette, WI
LED headlights are really bright and I cannot see anything when those cars with those headlights are coming at me from the other direction.

B.855 May 20, 2019 — Rochester, NY
I drive for a living and these lights are dangerous!

B.856 May 20, 2019 — Saginaw, MI
I'm signing because these lights are way too bright on the newer vehicles. I pretty much avoid driving at night and early morning hours because I'm tired of being blinded by the headlights.

B.857 May 20, 2019 — San Antonio, United States
These lights really are blinding and you can't see they really need to do away with these lights.

B.858 May 20, 2019 — Slaterville Springs, NY
I can't support and stress this enough. I have almost crashed several times. Not to mention my head kills me after. I shouldn't have to face migraines due to vehicle headlights being so dang bright. There's okay bright and HOLY CRAP! I'm pretty sure it's an easy fix!

B.859 May 20, 2019 — St. charles, MI
These are HORRIBLE. You cannot even see the white lines on the road when a car/truck with these headlights come at you. The can cause so many accidents because the driver of the oncoming car can't see for a few seconds after one of these cars go by. They ARE DANGEROUS....not SAFE.

B.860 May 20, 2019 — Suttons bay, MI
Brite light coming at me are unsafe. They make me want to stop in the middle of the road

B.861 May 20, 2019 — Syracuse, NY

Ban them lights

B.862 May 20, 2019 — Traverse City, MI

I am diabetic and with fluctuating blood glucose levels, vision is also affected. I use anti reflective coating on my lenses for my glasses which helps cut down on the glare, but these headlights are just plain blinding to the point of needing sunglasses just to cut down on the glare of these ultra bright led headlights when they′re coming at you. It burns your retina and hurts to have to see them while driving at night when there's nowhere to temporarily divert your vision to.

B.863 May 20, 2019 — United States

They are blinding and very distracting!!!

B.864 May 20, 2019 — WEST VALLEY CITY, UT

The bright lights prevents me from driving

B.865 May 21, 2019 — Ballinger, TX

I′m also blinded by these lights.

B.866 May 21, 2019 — Berlin, NY

I am signing because i am ONE that has a problem with glare and these lights. So not necessary

B.867 May 21, 2019 — Columbia City, IN

I agree so dangerous blinding.

B.868 May 21, 2019 — Denver, CO

I cannot possibly drive at night safely with my family in the mountains

B.869 May 21, 2019 — Flirida, TX

Save lives, it’s more important than your bright fancy lights.

B.870 May 21, 2019 — Hudson, NY

We should regulate headlamp manufactures to specific lumen/brightness output. That way, no matter what the technology, the brightness would be roughly the same. On top of that, the ″cold″, ″sharp″ looking blue wavelength should be reserved for only emergency vehicles.

B.871 May 21, 2019 — Lapeer, MI

Those lights are blinding. Can’t see anything. They need to go

B.872 May 21, 2019 — North Providence, RI

Totally agree, while I have a 2019 Buick Envision, it′s maddening to me that every fourth or fifth driver flashes his or her beams at me to turn off my high beams when I don′t have them on same thing with my 2017 Buick. The lights are way too bright, I even brought it back to the dealer to see if maybe there was an issue with where they were pointed but they said nothing was wrong.

B.873 May 21, 2019 — Tuscola, United States

The LED’s make it hard to drive at night

B.874 May 22, 2019 — Amsterdam, NY

It’s very scary

B.875 May 22, 2019 — Frankfort, IL

Lyyn gray

B.876 May 22, 2019 — Greenville, NH

I often have to hold my hand up to mitigate the brightness of lights off oncoming traffic because I simply can′t see. Not to mention it actually hurts my eyes. When they are behind me I have to flip my mirrors.

B.877 May 22, 2019 — Salt Lake City, United States

I rarely flash my brights at oncoming traffic anymore these days because often what seems like someone with their high beams on is just someone with LED or HID lights on ″low″. It′s hard to tell for sure anymore. Anyway, glad to see many people speaking up about this. Always thought it was ″just me″.

B.878 May 22, 2019 — United States

Those lights are insane and I have a light case of night blindness, they bother me even with my corrective glasses

B.879 May 23, 2019 — Liverpool, United Kingdom

Ban bright car lights in uk too. Very hard to drive in uk as well at night. They blind me eveytime need banning and normal bulbs should be fitted as this is good on the older cars which is nicer on my eyes. Good luck of getting it banned in america.

B.880 May 23, 2019 — Saratoga Springs, NY

I've been blinded many times by the "blue" headlights and no standards or regulations are in place to protect other drivers.

B.881 May 23, 2019 — Traverse City, MI

Waaaayy too bright. 歷 It's like being a deer caught in headlights!! Whoever decided that, didn't think too long or hard on it. 浪

B.882 May 23, 2019 — Troy, NY

The bright lights make it impossible to see at night especially in the rain

B.883 May 28, 2019 — Bangalore, India

it is very much required for saftey of the people

B.884 May 28, 2019 — India

It very dangerous for opposite side driver as nothing would be visible as it leads to major accidents and may cause death

B.885 May 30, 2019 — Floresville, TX

These lights are dangerous during night time driving. I hope more lawsuits come about until they are completely banned for automobile use!!!

B.886 May 30, 2019 — Rye, CO

Bright headlights cause me to be temporarily blinded by them. Why can′t we go back to the normal headlights like we used to have? I support Banning these new bright ones.

B.887 May 31, 2019 — Baker, United States

I agree; LED headlights blind other drivers when approached from behind or head on, causing inability to focus on the road.

June 2019

B.888 June 1, 2019 — Malaysia

Not only effect on human but also environment and our precious sky indirectly.

B.889 June 1, 2019 — Petaling Jaya, Malaysia

This is important!

B.890 June 4, 2019 — Hartford, OH

I am signing up because it really hurts our eyes and could causing blind us to get back normal on the road.

B.891 June 5, 2019 — Santa Barbara, CA

Tremendously dangerous, frightening when you are driving and cannot see!! Please outlaw these lights!!

B.892 June 8, 2019 — Torrance, CA

At night on the freeway the glare is so bad from the cars behind me that are equipped with the super bright LED and HID headlights that I need to disable the rear and side view mirrors by pointing them in a direction away from the glare so I cannot see any of the traffic behind me. This puts me at a greater risk for having an accident.

B.893 June 9, 2019 — Coos Bay, OR

Blinding headlights should be illegal/banned.

B.894 June 16, 2019 — Reno, NV

These light create a terrible glare and leave a lasting effect on my vision even after they pass.

B.895 June 18, 2019 — Jupiter, FL

I'm signing because im tired of a**holes in lifted trucks that don't care if they blind other people with their headlights

B.896 June 19, 2019 — Carwoola, Australia

I drive on rural roads and cannot believe that some lights are legal, they are as bright as high beams.

B.897 June 25, 2019 — Salem, NH

The headlights hurt my eyes.

B.898 June 25, 2019 — Valrico, FL

I completely agree

July 2019

B.899 July 2, 2019 — Washington, DC

Good morning Vietnam it's about time someone took initiative to do something about this. I thought I was going to have to argue with all the police about not being able to see down the road, having police tell me that I'm too old to drive because I can't see anymore. The people that put those bars across their top or under the fog lights and every light coming out of the vehicle is a HD highbeam in your face burning up your eyes, they're just nuts. I have rednecks around where I live and they're just decorating their vehicles with these bright lights, they just love messing with people doing anything they can do to be offensive pricks...

B.900 July 2, 2019 — Wendell, MA

Ban LED headlights, tail lights, yard lights, bicycle lights. According to this Quora article looking at oncoming LED headlights is several thousand times stronger that looking directly at the sun. They bleach our rods and cones - needed to see colors. They accelerate macular degeneration. http://www.lightmare.org/

B.901 July 4, 2019 — Lexington, KY

I was on the interstate for about an hour tonight and counted 164 pairs of painfully, blindingly bright low beam headlights. My head and eyes still hurt from counting them and I won't do that again. This is getting ridiculous and more and more pop up every day. Even semis use them now. How is this legal?! They are so dangerous and should be banned.

B.902 July 7, 2019 — Menasha, WI

They hurt my eyes and blind me from incoming cars. DANGEROUS.

B.903 July 8, 2019 — Hooksett, United States

Because I get blinded at night, mostly in the rain. This is not ok and it needs to change

B.904 July 9, 2019 — Australia

I'm signing because blindingly bright headlights are unnecessary and dangerous.

B.905 July 13, 2019 — Mills River, NC

These lights are a lot worse on a truck because they are up higher. I see nothing but glare. I don't even see the cars in front of me anymore. I also get a big fricking headache.

B.906 July 14, 2019 — East Amherst, NY

These lights hurt and make driving at night even more dangerous.

B.907 July 17, 2019 — Llanddeiniol, ENG, United Kingdom

Strong LED headlights blind me when at the wheel.

B.908 July 18, 2019 — Miami, FL

I almost drove off the highway in the Mississippi Delta region because of night blindness caused by an oncoming car equipped with these lights. They pose a major risk for any night drivers!

B.909 July 25, 2019 — Paia, HI

yes, that's me. if you have those bright LED lights in your car and you drive by me I'm turning my hi-beams on full blast to burn your eyes out of their sockets and give you a taste of what you're doing to me. Anyone who is ignorant and selfish enough to drive a car with those invasive lights deserves nothing less than that, and no apologies!

B.910 July 27, 2019 — Grand Island, United States

While I am driving I have to shut my eyes against these solar flares and hope I do not have an accident. Even in broad daylight. These diabolical people who put these on the market and continue to do so are CRIMINAL and they just get away with it.

B.911 July 27, 2019 — Oshawa, Canada

They blind me

August 2019

B.912 August 2, 2019 — Dixon, IL

I have had many close calls because of those headlights I think they should be banned

B.913 August 4, 2019 — syracuse, NY

Everyone I've discussed this with has had the same experience of being blinded by oncoming headlights at night.

B.914 August 13, 2019 — Auckland, New Zealand

They are a danger. I am constantly blinded while driving.

B.915 August 13, 2019 — Houston, TX

They are extremely dangerous !! So blinding, when you try to look off so to keep control of your vehicle, YOU almost run off the road. They ARE NOT. necessary

B.916 August 13, 2019 — United Kingdom

LED headlights literally make the road disappear when a car with them drives towards me with them on. It doesn't even have to be pitch dark for me to be blinded either. Car headlights need to be regulated and tested. There's research that proves LED lights damage the retina of the eyes.... When we drive at night, the lights shine directly into our eyes, as we have to look straight ahead at the road ahead, so we cannot avoid them shining into our eyes! This is dangerous and really needs to be looked at!!! Thank you for creating this petition <3

B.917 August 16, 2019 — Jacksonville Beach, FL

Because these super bright lights are out of control & enough is enough already!

B.918 August 19, 2019 — Fort Wayne, IN

I drive at night delivering newspapers for 3 hours a night, I get home and my eyes feel like they're burning. I'm sure it's damaging my retna. If someone was to walk in the street, or a deer,I would never see them because of the blinding light,also have my review mirror facing the right,so behind drivers don't blind me,which makes it useless.Going to the eye doctor soon for a exam to see if it's damaging my eyes.These LED headlights have got to go!!! I can guarantee law suits will start soon.

B.919 August 20, 2019 — Minneapolis, MN

I like to drive without being blinded

B.920 August 25, 2019 — Jenks, OK

The life you save could be your own or a family member or friend!

B.921 August 25, 2019 — Louisville, KY

These type lights are actually too bright!!

B.922 August 30, 2019 — petrolia, CA

I live at the end of a long, narrow, winding country road, where i am often blinded by what i call, if you will excuse the expression, Asshole Lights. I am delighted to promote a ban on these Asshole Lights!

B.923 August 31, 2019 — petrolia, CA

Especially with cataracts.

September 2019

B.924 September 1, 2019 — Pensacola, FL

I've thought these lights were painful from the beginning. I'd love to see them replaced by a softer option that doesn't sear the retina

B.925 September 3, 2019 — ********, PA**

I have night blindness n it's hard enough for me to see without those blinding headlights. Get rid of them! Ban them!

B.926 September 4, 2019 — London, ENG, United Kingdom

LED headlights regularly blind me and make driving dangerous.

B.927 September 10, 2019 — Denver, CO

I'm blind!!!!!

B.928 September 11, 2019 — Arnold, MO

If i cant see behind me to merge safely on the highway because some asshole in a truck tailgating me has illegal headlights, then i shouldnt be held responsible for an accident that happens because of it.

B.929 September 15, 2019 — Boaz, AL

Because I have migraines and these horrible lights are one of my triggers, and they are so bright I can't see the road even if the lines have been recently painted. I'm fine with normal lights, but these HID hazards need to go. I hope this ban extends to gas stations and any lights visible from the road.

B.930 September 16, 2019 — Port Alberni, Canada

These lights give me a migraine. Very dangerous, have to look away. These horrible headlights just caused a horrible accident with 2 young students being killed because the driver had to swerve away from the blinding oncoming headlights. Ban them completely and go back to the normal headlights please!!

B.931 September 17, 2019 — New Rochelle, NY

How are these "safer" if I'm blinded to the extend that I cannot see ANYTHING!! They are ridiculously bright even during daytime. Apart from what should be the obvious blinding danger of these things, their sharp cutoffs, bouncing around in and out of sight increases stress and anxiety. It's

no different to having a laser flashed in your eyes. I now avoid night driving - even walking at night has become an annoying experience. I truly wish those in charge would DO SOMETHING!!

B.932 September 18, 2019 — Port Alberni, Canada

I am signing this because these bright headlights burn my eyes when they are coming towards me. If I have been on a dark road they come around a corner and my eyes don't have time to adjust. They are making our roads less safe.

B.933 September 20, 2019 — New York, NY

Almost got Into an accident today, please ban these bright led lights

B.934 September 21, 2019 — Guildford, ENG, United Kingdom

These new headlights are distracting, dazzling and dangerous. They need to be regulated and permitted brightness needs to be reduced to a safe level.

B.935 September 22, 2019 — Akron, OH

It's effecting my eyes, I have to drive at night with sunglasses because the car lights are piercing

B.936 September 24, 2019 — vancouver, Canada

Fuck those lights

B.937 September 26, 2019 — Derby, ENG, United Kingdom

Simply had enough of being blinded by these ridiculous lights and I feel bad about directing my wing mirrors to reflect straight back at the driver behind even though they should back off or lower their beams.

B.938 September 26, 2019 — Trenton, MI

Fed up with those damn lights blinding me and i am not that old. What is wrong with the cops? Ticket the hell out of those dangerous idiots!

B.939 September 28, 2019 — Pensacola, United States

The headlights are blinding amd dangerous to anyone driving

B.940 September 29, 2019 — Colrain, MA

Personal experience blinded by these lights!!

B.941 September 29, 2019 — Wichita, KS

I can't see

B.942 September 30, 2019 — Melbourne, FL

They make it hard to drive at night

October 2019

B.943 October 1, 2019 — Ipswich, ENG, United Kingdom

After spending 15 months in hospital after a car accident, I do not want to be reliving those months again, if of course I am still living.

B.944 October 2, 2019 — Northampton, MA

Headlights do not need to be as bright as some of them currently are...

B.945 October 3, 2019 — Savannah, GA

YES I HATE THEM SO MUCH

B.946 October 4, 2019 — Bay City, MI

I can't drive at night. I mean I can but I'm blinded. I literally slow down so they can pass.

B.947 October 6, 2019 — Clark, NJ

Anything to reduce the brightness of headlights like this!

B.948 October 6, 2019 — Clark, NJ

Me too! I just pull over so they can get ahead of me. Way too dangerous.

B.949 October 9, 2019 — Plymouth, MA

These retina burners need to go!! The pain and blindness headlights AND tail lights cause is unacceptable!! Since when do we need 6 sets of headlights?

B.950 October 10, 2019 — Aliquippa, PA

Holly Tosadori

B.951 October 10, 2019 — Zephyrhills, United States

My cousin accident

B.952 October 11, 2019 — Frostburg, MD

My vision is becoming negatively impacted! We can see with regular halogen lights!

B.953 October 13, 2019 — Spring Hill, TN

Migraines, nausea, dangerous!

B.954 October 16, 2019 — Pell City, AL

I was blinded by super bright headlights the other night . The road was wet . The other driver was speeding too. I yelled to my son that I could t see and almost went down a embankment into a river . He never once dimmed his lights !!

B.955 October 17, 2019 — Myrtle Creek, OR

I too have been totally distracted by those LED lights front and back, during both daylight and night time driving.. They are absolutely distracting and one would require a pair of special glasses to minimize the glare that these LED lights create.

B.956 October 18, 2019 — Long Beach, CA

Can't see anything with these idiotic lights

B.957 October 18, 2019 — Phoenix, AZ

Such headlights create a dangerous and hostile landscape for other drivers and pedestrians.

B.958 October 19, 2019 — Lakeland, FL

It blinds you when they are either coming towards you or driving behind you.

B.959 October 20, 2019 — Belvidere, IL

Laurie McWilliams I hate them

B.960 October 20, 2019 — Brownsville, TN

I rear ended someone last Sunday, due to two improperly adjusted headlights. I look away and it still didn't help anything. I have been complaining about it for a while and everyone says: "Oh, you'll get used to it". WELL I AM NOW!

B.961 October 21, 2019 — Australia

Absolutely BLINDED from FRONT and REAR...!

B.962 October 21, 2019 — Bel Air, MD

I detest those LED headlights since they do nothing blind everybody especially when it is raining. They should have never been made for vehicles in the first place

B.963 October 22, 2019 — Charlotte, United States

They should either be banned or have an annual inspection of the lights to ensure they are aimed at an angle that wont blind drivers. It's a specially impactful when it's a taller vehicle.

B.964 October 22, 2019 — Epping, ENG, United Kingdom

Led lights are absolutely ridiculous how are the brightness of them legal

B.965 October 22, 2019 — Middle River, MD

I'm absolutely sick of being blinded by head lights, if it's illegal to drive with your high beams on, then why are these lights that to me seem brighter then high beams legal?!?!

B.966 October 22, 2019 — Springfield, OR

I drive a lot at night, and these obnoxious blue headlights are blinding and dangerous. We need to outlaw them and require manufacturers to switch to more yellow spectrum leds that are easier on the eyes and do not scatter light as much.

B.967 October 25, 2019 — Bentonville, United States

They are dangerous

B.968 October 25, 2019 — Cazenovia, NY

Standards for vehicle lighting has not kept up with the lighting technology. Spectral changes in light emission, intensity, and the sharpness or transition between full intensity and no light have all changed dramatically with HID and LED technology and need to be addressed. Drivers are experiencing persisting blindness post encounter with head on traffic that has HID or LED technology.

B.969 October 25, 2019 — Lexington, MA

These blinding headlights make night driving difficult and dangerous.

B.970 October 25, 2019 — Melbourne, FL

The glaring headlights make it harder to see and make my migraines worse.

B.971 October 25, 2019 — Merlin, OR

Yes. It is blinding the oncoming driver.

B.972 October 25, 2019 — Nokesville, VA

A little enforcement of the already-existing laws making it illegal to sell or use LED replacements for incandescent headlight bulbs would be nice.

B.973 October 25, 2019 — Shrewsbury, MA

Im signing because of the bright blinding headlights. Use at night is like bright lights in your eyes.

B.974 October 25, 2019 — Tucson, AZ

Lights that suppress melatonin are a very GOOD idea, but no lights should be too bright. I have been temporarily blinded by headlights in spite of my best efforts. Some lights are simply too bright. When I can't see, I panic.

B.975 October 25, 2019 — United States

Some of these LED and HID lights are too bright

B.976 October 25, 2019 — captain cook, HI

In rural areas where it is totally dark the fully dark adapted eye is especially vulnerable

B.977 October 26, 2019 — Beaumont, CA

This is extremely dangerous especially with raised pickup trucks that have not had there lights readjusted. Even more for me as I am 82 years old.

B.978 October 26, 2019 — Denver, CO

These lights are dangerously bright and need to be limited.

B.979 October 26, 2019 — Gastonia, NC

I'm tired of being blinded by mega bright headlights! I almost went into the opposite lane a few nights ago from lights blasting me in the face! I hate going out in the evening at all anymore!

B.980 October 26, 2019 — Germany

because I am a night protector and know very well about the shortfalls of blinding blue light. This really needs to be banned.

B.981 October 26, 2019 — Kannapolis, NC

These headlights blind me from the opposite direction, especially at night and when they reflect on wet road surfaces. They also blind me from behind too from high profile pick-up trucks. I have to duck below the glare to see out my front windshield. I use my headlights during the daylight, mostly out of habit. What irks me more is idiot drivers that don't use headlights in the rain, snow and fog despite local laws requiring them. Imagine the enormous amount of traffic tickets police could write not using headlights.

B.982 October 26, 2019 — Statesville, NC

Due to the fact that blinding oncoming traffic is more dangerous than driving in the dark ! It's way past time for these so called safety agencies do their jobs and that includes setting a maximum height for headlamps on ALL vehicles which should be no higher from roadway than 17 inches.

B.983 October 27, 2019 — Bristol, United States

I too have been blinded by them

B.984 October 27, 2019 — Cheyenne, WY

I'm signing because halogen headlights are completely blinding. The rest of us should then use our high beams at all times to compete to see the roads at night.

B.985 October 27, 2019 — Tazewell, TN

I hope to see that ALL LED and HID headlights on ALL vehicles - No Exceptions - become banned and illegal. They are blinding and endanger lives.

B.986 October 27, 2019 — West Roxbury, MA

As a roadway lighting professional, glare is the most underrated metric in design. Blue light glare is real but difficult to measure because it's effects are different per person. Older people are far more susceptible to blinding glare because as we age our eyes's corneas become less clear and the blue light scatters passing thru the eye just like it does in rain, or fog. The blue scattering is called "Rayleigh scattering". Car headlights are the worst offenders, but they should also look at warmer street lights (3000K CCT or less). The scattering effect is much more noticeable in inclement conditions (rain fog snow), but unfortunately the visibility studies are typically done in perfect conditions.

B.987 October 27, 2019 — Woodsboro, MD

Because these lights are terrible and are blinding.

B.988 October 28, 2019 — Pikeville, TN

They are blinding!!!

B.989 October 28, 2019 — Seattle, WA

I have nearly gone off the road countless times due to the blazing glare of the new hot white headlights. Particularly in rain they are a terrible hazard. They aren't necessary for seeing the road, and they should be banned.

B.990 October 28, 2019 — new tazewell, TN

Bright white head lights are blinding and dangerous.

B.991 October 29, 2019 — United States

They are a hazard and are a cause for the up swing in deadly wrecks in the last 2 years. They should be banned!

B.992 October 30, 2019 — Bear, DE

Yes!! Please, please, PLEASE, write requests to initiate legislation to your state senators and representatives - I did. Part of my letter - please use this first sentence in your letters to them or

something similar: This morning, a person was behind me and even just a short glance before covering my eyes, I has a bright spot appear in my field of vision that made it very difficult to see the road or anything else. I am only 58 - as I get older it will multiply this problem.

B.993 October 30, 2019 — Clear Lake, WI

LEDs should be banned!! and only the AMBER daytime running lamps should be used on all cars, trucks, and buses (including school buses) during daylight hours.

B.994 October 30, 2019 — Eden Prairie, MN

Too bright vehicle lighting is not only dangerous but also just a general nuisance to other drivers and anyone else near roads, driveways, and parking spaces wherever there are vehicles. The bright lights ruin the outdoor experience. What a shame. Too bright vehicle lighting is part of a general trend of too bright lighting everywhere, from digital signage, to flood lights, to LED interior lights that can be seen a great distance through windows, TVs in windows, places of business, outside, and high intensity LED tower strobe lighting that ruins vistas. We are facing an assault of bright lighting. I hope people join and form strong activist organizations that will fight bright lighting. We are also facing an onslaught of rising noise pollution everywhere. Many technological trends are adding stress to our lifes and reducing the quality of life and outdoor living.

November 2019

B.995 November 1, 2019 — AP, United States

Time to MAKE THESE LIGHTS a thing of the past! They are WAY toooo BRIGHT and impedes the driver heading towards it.

B.996 November 1, 2019 — Conway, SC

You really can't tell if they have their bright lights on or not, and they really do not care that they are blinding drivers.

B.997 November 1, 2019 — Conway, SC

They also negatively affect people just walking on the road. If a driver gets blinded he/she may not be able to see the person walking on the road. It has happened to me several times already.

B.998 November 4, 2019 — Arroyo Grande, CA

I drive with Uber and Lyft in my retirement. Some of the headlights I encounter are outrageously, blindingly and absolutely unnecessarily bright!!

B.999 November 4, 2019 — Bloomfield, NJ

I'm signing because this is incredibly true and sadly so. I had to give up driving at night because of these blinding headlights. When the transition from daylight tonight is coming it's even worse. Several times since the beginning of using these headlights in cars over the last years I have almost hit pedestrians. I now stop in the middle of the road at night when a car is blinding me with its headlights because I would rather have somebody angry behind me then hit somebody. That's a horrible way to live and this has to stop. The AMA gave these guidelines so many years ago and they have been totally ignored. It's unconscionable that so many people are complaining and that no one is doing anything about it. I doctors have told me that the lights are blinding. They feel helpless because nobody is listening. We cannot stand for this. It could be one of your loved ones that gets hit and then what will you do? You won't be able to turn the clock back and you will live with that forever

B.1000 November 4, 2019 — Brooklyn, NY

These blinding lights are just overkill. They are not needed.

B.1001 November 4, 2019 — Cliffside Park, NJ

I like to prevent undo trauma of accidents due to blinding head lights!

B.1002 November 4, 2019 — Monroe, CT

There becoming more an more dangerous , especially to elderly folks

B.1003 November 5, 2019 — Ashburnham, MA

These headlights are hazards! Get them off the road, please.

B.1004 November 5, 2019 — Lisle, IL

This is an unnecessary problem since LED lights can be any wavelength or color temperature based on filters around the source.

B.1005 November 5, 2019 — Port Washington, NY

Bonnie Utzig

B.1006 November 5, 2019 — San Diego, CA

I hate these blinding lights!

B.1007 November 5, 2019 — Wausau, WI

I agree 100%

B.1008 November 5, 2019 — san diego, CA

I'm glad I'm not alone in feeling like these overly bright lights are impairing my vision.

B.1009 November 6, 2019 — Agency, MO

These light are blinding when you come upon them on the road or behind you.

B.1010 November 7, 2019 — Douglasville, GA

I commute to school every morning. I cannot see even in broad daylight with these headlights because of the intense glare. They shouldn't be allowed.

B.1011 November 8, 2019 — Leusden, United Kingdom

Seventh Angel Care Revelation 10:7 / 11:15

B.1012 November 8, 2019 — Pueblo, CO

I work as a delivery boy. Whenever I work dinner shifts and it starts to get dark it becomes near impossible for me to see where I'm going due to LED headlights from on coming traffic blinding me

B.1013 November 8, 2019 — Seattle, United States

I am all for bright headlights and being able to see well in the dark, but being blinded by these lights is ridiculous. There needs to be higher standards for bright lights. For example, cars that have really bright HID or LED headlight systems need to have auto dimming feature installed, dim the lights when ambient light is high enough. We do not need SUPER BRIGHT HEADLIGHTS when driving in the city most of the time, the new LED street lights provide enough light as it is. When driving on dark roads though, all cars should be equipped with auto dimming or auto aiming headlights so they do not blind oncoming traffic.

B.1014 November 9, 2019 — Anchorage, AK

Fuck bright headlights

B.1015 November 9, 2019 — Corpus Christi, TX

I used to be upset with the consumers who are naïve and driving dangerous cars. The problem are the manufacturers. I am now going to start a list of manufacturers and model vehicles that are dangerous for the road: Ford F-150 Platinum 2020

B.1016 November 9, 2019 — Minneapolis, MN

LED headlights are making night time driving less safe.

B.1017 November 9, 2019 — Roanoke, VA

Fuck bright lights

B.1018 November 10, 2019 — Corpus Christi, TX

I believe this impairs other driver's ability to drive safely.

B.1019 November 10, 2019 — Worcester, MA

Led headlights are an absolute menace and should be banned by authorities if they are really interested in public safety.

B.1020 November 11, 2019 — OAKLAND, CA

I had a horrible drive home from Oakland down the 5 to LA. I was getting blinded from all directions (rear view mirror, side view mirrors, even some oncoming (despite there being a large median). I have a pounding headache today and find the general lack of concern about this to be alarming. Responses like "drivers will adjust as this becomes more common" is such capitalist b.s. These lights are terribly dangerous and unnecessarily bright. I don't think we need to go back to a world of solely halogen lamps but I do think we need to adjust the legal allowable lumens. It's like I've been seeing flashbulbs for the last 12 hours.

B.1021 November 11, 2019 — OAKLAND, CA

Also, I'm 34 so this ageism around who is affected is ridiculous. I would hop on a class action about vision impairment due to these lights in a heartbeat.

B.1022 November 11, 2019 — Phoenix, AZ

I agree with a complete and outright ban of LED and other blue-light headlamps and tail lamps on all moving vehicles (cars, trucks, vans, etc.) I also agree with another signer--if a person can't see properly at night with normal headlights, he/she shouldn't be driving! Get off the road!

B.1023 November 11, 2019 — Somerville, MA

I am an optometrist. Patients tell me they are bothered by these lights EVERY DAY! I am so happy someone is doing something about it, I will share will all of my patients and colleagues. These lights are a public safety issue effecting everyone, not just the elderly.

B.1024 November 12, 2019 — Seattle, United States

most new mercedes are awesome and have some of the most non blinding lights I have seen.

B.1025 November 13, 2019 — Rio dell, CA

I don't enjoy driving at night anymore because of all these awful headlights from high-end cars and kids putting ultra-bright LED/HID lights in their cars. It's a distraction and danger to all drivers on the road and I've wondered why DOT has sat on their asses doing nothing about it??

B.1026 November 14, 2019 — Petersburg, United States

When I first started seeing these headlights, I thought, "What the heck??!!!?? I thought that was illegal!!!" I still most emphatically think they should be. I used to hate them because of how horrible they are when someone is approaching you from the other direction. Then I drove a loaner vehicle that had them, and discovered that I couldn't see properly as the driver, either! Why does ANYBODY buy these cars?

B.1027 November 15, 2019 — Cambridge, MA

I've been doing a lot at night driving lately I have to for work since we have our shorter days. And my eyes are really bothering me and it's been difficult driving the hour and 15 minutes three nights a week. There is going to be more car accidents because of it that's for sure. Never mind it harming your eyes I don't want my eyes damaged because I have to drive at night.

B.1028 November 15, 2019 — Klamath Falls, OR

I just drove two nights across the Nevada and Arizona deserts on two lane highways 93 and 95. The glare from headlights of many of the oncoming vehicles, both cats and semi trucks, was nerve wracking. Three times I was temporarily blinded as they passed me. I had a headache when I arrived in Las Vegas that stuck with me to Phoenix.

B.1029 November 15, 2019 — McKinleyville, CA

Those lights are dangerous. Too bright, they actually blind you, when they sign in your face while driving

B.1030 November 16, 2019 — Exeter, NH

I'm signing because I can't see when people forget to turn the high beams off and I'm blind it's not safe.

B.1031 November 16, 2019 — Magnolia, DE

I cant see in the dark very well. And when these headlights come at you I TEALLY cant see

B.1032 November 16, 2019 — cranston, RI

These lights blind you even when they drive behind you. They cause me to see spots when they shine in my rearview mirror and I have to drive with the mirror angled down.

B.1033 November 16, 2019 — cranston, RI

Also,if it is against the law to drive closely to another car with high beams on why are these allowed?

B.1034 November 16, 2019 — cranston, RI

Also,if it is against the law to drive closely to another car with high beams on why are these allowed?

B.1035 November 17, 2019 — Bluff Park - Hoover, AL

I'm signing because I'm SICK of these new lights blinding me while driving at night!!!! They are FAR too bright and the idiot who came up with these lights should've known that they were far too bright to use!

B.1036 November 17, 2019 — Cork, Ireland

Evidence is mounting about the dangers if excessively bright, harsh, glaring artificial lights in our environment, especially after dark. Industry won't act until officials pass legislation to make them do so. Officials must listen not only to the science (which takes time to do properly), but to the experiences of ordinary people who suffer the effects of excessive lighting. Instead of waiting for years or decades for the epidemic to be proven (like with smoking), act now, and save the thousands of lives that are lost needlessly every year.

B.1037 November 17, 2019 — Metairie, LA

Lights are too bright. Dangerous

B.1038 November 18, 2019 — Fountain Valley, CA

Something needs to be done to monitor the brightness of these lights, which are more piercing - especially when surrounded by darkness. It's getting to the point that you can't drive at night because of being blinded by oncoming lights. Brake lights are too bright (combined with too many) also!

B.1039 November 19, 2019 — Dallas, TX

I never had a problem with the old lights. Now the new led lights cause me to have photo sensitive seizures. Thank you for petitioning for change.

B.1040 November 19, 2019 — Medford, OR

My wife gets ocular migraine whenever those blinding LED headlight shines her way. It also blinds me to the point I'm lucky I don't go off the road or hit anyone. Those LED lights are dangerous!

B.1041 November 19, 2019 — Phoenix, AZ

These are unnecessary and dangerp

B.1042 November 19, 2019 — York, PA

These lights are extremely bright for no reason, it isn't necessary. They blind and disorient drivers

B.1043 November 20, 2019 — Fresno, CA

THEY ARE BLINDING! It's entirely unnecessary and thoughtless. A pox on the inventor!

B.1044 November 20, 2019 — Grimsby, ENG, United Kingdom

I struggle driving at night because of led lights.

B.1045 November 20, 2019 — Pittsburgh, PA

The new chilling white headlights need to be removed from the roads please. I'm getting blinded from the front and also from behind me as well. Yes. They look very crisp and very cool. I'm sorry though; some things seem good but just don't work for the application.

B.1046 November 20, 2019 — Scunthorpe, ENG, United Kingdom

I believe they are dangerous to oncoming traffic especially in wet weather

B.1047 November 20, 2019 — Vallejo, CA

These headlights are terribly dangerous and cause great anxiety in drivers.

B.1048 November 21, 2019 — Sandbach, ENG, United Kingdom

The headlights are that bright I cannot see its sometime hard to make out if they are on full bean or not! They are so dangerous both in the opposite direction or when a car is behind you with the headlights on. I believe these need to be banned!

B.1049 November 21, 2019 — Staten Island, United States

My eyes aren't what the use to be. Those lights are blinding and cause headaches

B.1050 November 21, 2019 — Tallahassee, FL

I agree! I hate these blinding blue lights. They should be banned from normal use.

B.1051 November 21, 2019 — colfax, WI

They are very blinding and need to be banned.

B.1052 November 22, 2019 — Drumright, OK

Yes please let's save some lives by saving our vision!!

B.1053 November 22, 2019 — Drumright, OK

This affects me

B.1054 November 22, 2019 — Granbury, TX

Highway driving is not so bad. But on dark country roads its impossible to see when a car comes towards you... if there is someone with bright lights behind you it's even more dangerous, and its getting so much worse.

B.1055 November 22, 2019 — Hagerstown, MD

Have to be at work early in the morning and live in the country . I'm always looking for deer and when an oncoming car has these lights I can't see anything after passing and if there are following me it's so bright I have to move all my mirrors just to be able to see what's in front of me.

B.1056 November 22, 2019 — Hamilton, MT

They are a dangerous product!

B.1057 November 22, 2019 — India

it is required.

B.1058 November 22, 2019 — Indianapolis, IN

These awful things should have never been approved by the National Highway Safety Institute. They are way too dangerous!

B.1059 November 22, 2019 — Miami, FL

Of my friend and myself

B.1060 November 22, 2019 — Sparta Township, NJ

Light sensitive eyes and there are certain headlights that cause lasting difficulty with focus.

B.1061 November 22, 2019 — Staten Island, NY

Its blinding at night and could cause seriuos accidents

B.1062 November 22, 2019 — United States

because it an accident waiting to happen for the other driving in the opposite direction. if it hadn't happen already !

B.1063 November 22, 2019 — United States

I used to enjoy driving at night. Not anymore. The LED headlights are the main issue. HID lights never bothered me at all. There is something about the intensity and the color temperature of LED lights that just kills my night vision and causes so much glare. This is even worse on pick up trucks or some SUV's that sit higher than passenger cars. Have one pull behind you at a stop light and their lights are shining directly into your back window, blinding you by the rear view mirror. The Feds should require that all headlights be at a maximum height no matter how tall the vehicle is to prevent this scenario. More people will die on our roads until this issue is resolved.

B.1064 November 22, 2019 — Woodstock, United States

I'm a migraine sufferer and it's already hard to drive at night, but these horrible things are making me consider giving up night driving entirely. That would have a huge negative impact on my life, including possibly costing me the part time job that allows me to live a better life on disability and makes me feel like a contributing part of society. Adaptive glasses with my special prescription would be very expensive. It's backwards to expect people to spend money they don't have or sink deeper into poverty to adapt to these dangerous lights.

B.1065 November 22, 2019 — rensselaer, NY

They blind you when coming torge you

B.1066 November 23, 2019 — Columbia, MD

I'm signing because I have been noticing the past few months that I'm being blinded by these new fangled headlights. At first I thought these were high beams, but then I realized that they are different and much more bluish. IT makes a significant difference to me because I often drive on 2-lane undivided roads.

B.1067 November 23, 2019 — Durant, OK

With my sunglasses on during the day, the LED lights on cars are still brighter than sunlight reflected off chrome on cars. This is with my sunglasses on. These lights must be damaging to young people's eyes at night when they have no light protection glasses on. I envision a class action lawsuit in the near future.

B.1068 November 23, 2019 — Pittsburgh, PA

Driving at night is already difficult. Blinding lights on two lane roads are a nightmare and extremely dangerous. If it's raining, even more.

B.1069 November 23, 2019 — Tulsa, OK

These lights should be banned! I've had to slow to almost a stop numerous times on two lane roads because of these lights. I hate driving at night now.

B.1070 November 23, 2019 — United States

These lights kill my eyes for night driving that I'm afraid to get into a wreck. These lights blind me to where I can no longer see

B.1071 November 24, 2019 — Maple Plain, MN

I struggle to see every time I have these lights coming at me from the opposite direction.

B.1072 November 24, 2019 — Minneapolis, MN

Might also reduce light pollution so we can see the stars that are also blocked from our vision

B.1073 November 24, 2019 — Prescott, AR

They are so blinding ! That can be dangerous

B.1074 November 25, 2019 — Chicago, United States

The headlights have become so bright, they are now a distraction and hindrance.

B.1075 November 25, 2019 — Philadelphia, United States

They are dangerous

B.1076 November 26, 2019 — Philadelphia, MS

These lights are very dangerous even in daylight! They totally blind the driver in the oncoming car and they are so bright it remains in your eyes like you've looked at the sun too long. Hideous invention.

B.1077 November 26, 2019 — Waianae, HI

I'm signing because I'm happy that they can see better. But can they see me DRIVING OFF THE EDGE OF THE ROAD BECAUSE THEY BLINDED ME?????

B.1078 November 27, 2019 — Lebanon, IN

Because LED headlights are blinding and most drivers who use them also use fig lights which are also LED- making it hard to focus in the rain or darkness- they also tailgate with them in our rearview mirror- they need to be banned-

B.1079 November 27, 2019 — Minneapolis, MN

These lights are blinding and terribly dangerous, not to mention unhealthy for the human eye. They should be banned in all forms

B.1080 November 27, 2019 — Wheatridge, CO

As a pizza guy I drive a lot and these leds gotta go!!

B.1081 November 28, 2019 — Abbotsford, Canada

These things are as much a driving hazard as cell phones

B.1082 November 28, 2019 — Austin, TX

It's getting ridiculous out there. It's also getting dangerous. Something needs to be done or there are going to be a lot more accidents.

B.1083 November 28, 2019 — Bat Yam, Israel

Photosensitive

B.1084 November 28, 2019 — Manchester, NH

These new lights are dangerous. Not too many years ago you would get a ticket for having high beams on when approaching on coming traffic. Today's lights are so much brighter than old high beams, and more lights on the the new vehicles. Who needs four lights on one side of the car? Yes, eight lights in my rear view mirror. These need to be banned.

B.1085 November 28, 2019 — St. Albert, Canada

The led headlights are way too bright and can cause me to have a migraine.

B.1086 November 29, 2019 — Aloha, OR

These lights are horrible and cause you to be blinded at night in both directions and causing people to almost drive off the road in the dark due to people getting blinded! These need too band!

B.1087 November 29, 2019 — Jackson, MS

I don't like the bright lights.

B.1088 November 29, 2019 — Portland, OR

As someone who bikes at night I want to share these are not only blinding to me, the person who has to take care not to hit obstacles that can cause me to fall or end up in the road, but actually painful and sometimes nausea inducing for those of us with sensitive eyes.

B.1089 November 29, 2019 — chicago, IL

Having Epilepsy alone makes this unfair!!! Ad in someone w/ a brain injury, autism, even overstimulation & we cannot function. I don't know how this is ok & legal. Pleaseeeee no more of these lights

B.1090 November 30, 2019 — Springville, NY

They are blinding

December 2019

B.1091 December 1, 2019 — Brandon, FL

The DOT and police depts could make five times as much revenue from ticketing people with these headlights than they could speeders-! Please do something, it's very bad here in Florida.

B.1092 December 1, 2019 — Chicago, IL

It's hard enough to drive at night or when it is raining!!! What's the purpose!?

B.1093 December 1, 2019 — Dalzell, SC

I would love to see something like this become law!

B.1094 December 1, 2019 — Floral Park, NY

Too damn bright! There's no need. And people drive with their high beams on too. Tell them to get a clue! Dangerous!

B.1095 December 1, 2019 — King of Prussia, PA

Common sense says these lights are dangerous but the idiots at NHTSA don't care for passenger safety.

B.1096 December 1, 2019 — New Orleans, LA

These headlights are dangerous. They will kill people.

B.1097 December 1, 2019 — PLANO, TX

The new bright headlights are worse than someone with brights on. I am constantly traveling, and am,blinded at least 3 times every night I'm,on the road. I have have prescription yellow tinted glasses and they only take away a tiny bit of the pain my eyes feel,when confronted. These things are dangerous.

B.1098 December 1, 2019 — Perrysburg, OH

Night time driving is potential dangerous with LED lights on cars!

B.1099 December 1, 2019 — Perrysburg, OH

Night time driving is potential dangerous with LED lights on cars!

B.1100 December 2, 2019 — Castle Rock, CO

Enough with the excessively bright headlights on cars. They are dangerous.

B.1101 December 2, 2019 — Cincinnati, OH

They blind ME!!!!

B.1102 December 3, 2019 — Cheshire, CT

These blinding headlights are dangerous! Please ban them right away!

B.1103 December 3, 2019 — Plymouth, ENG, United Kingdom

Might as well be cornering with my eyes shut

B.1104 December 3, 2019 — Stockholm, Sweden

It is really difficult to see when blinded by HID and LED. There is NO better light for driving than halogen.

B.1105 December 3, 2019 — Warwick, MA

I like my rods and cones.

B.1106 December 3, 2019 — Windsor, MO

The headlights are a danger to any driver regardless of age!

B.1107 December 3, 2019 — turners falls, MA

I personally have find myself squinting at theses coming at me and feel that they are unsafe

B.1108 December 4, 2019 — Dunedin, New Zealand

These lights are dangerous.

B.1109 December 4, 2019 — GA, United States

I drive an older model truck, with the more yellow-white head lights. My truck is a normal height. It is a step up to get in and I am being blinded by small cars. I will flash my brights, so they will dim theirs, only to be flashed back, because they didn't have their brights on. I am in my 20s, this is not an old person thing. And of course then you have the jacked up trucks with these new lights.... They may as well have their brights on all the time! I literally cannot see the lines on the road at night and I work until dark everyday. I know you are suppose to look away or at the white line, but I couldn't see anything! Its so scary....Please help. I don't want to become a statistic...

B.1110 December 4, 2019 — Laurel, MD

Twice recently a large pickup truck was approaching with the blinding led lights on a windy back road I was traveling on. Both times I almost ran off the road due to being completely blinded. These lights are dangerous and worse than any "bright lights " from years passed. The courteous thing was to turn them off when another car was approaching, but now these new LED lights cannot be turned off.

B.1111 December 4, 2019 — Pomona, Australia

I am startled by the glaring LED lights. Car headlights should not be a dangerous distraction

B.1112 December 4, 2019 — Sault Ste. Marie, Canada

These lights induce migraines for me. and during the winter months it is especially scary when I cant see the road ahead of me..

B.1113 December 4, 2019 — Sault ste marie, Canada

It needs to be done

B.1114 December 4, 2019 — South Hadley, MA, NY

Anything that damages our sight should not be allowed.

B.1115 December 4, 2019 — Wanaka, New Zealand

These lights are blinding, and it doesn’t feel safe on the roads

B.1116 December 5, 2019 — Blythewood, SC

They blind me

B.1117 December 5, 2019 — Cedar City, United States

ITS RIDICULOUS HOW BRIGHT PEOPLE’S LIGHTS HAVE GOTTEN. RIDICULOUS

B.1118 December 5, 2019 — Dunedin, New Zealand

I can no longer drive on the open road at night, I find these lights absolutely blinding. As a father I refuse to drive on the open road after dark, in Otago that is before 5pm in fair weather, in peak winter. That sucks. ☒

B.1119 December 5, 2019 — Lewisville, TX

Tired of these headlights blinding me wtf

B.1120 December 5, 2019 — Saint George, UT

I'm sick of being blinded at night by ridiculous bright headlights that you can't even see where the road goes!

B.1121 December 5, 2019 — San Francisco, CA

These lights are not safe nor are they necessary.

B.1122 December 5, 2019 — Southeastern CT, CT

Ban LED brake lights as well. Enough is enough!

B.1123 December 5, 2019 — Toledo, OH

These headlights are so bad! They are blinding and should not be used for cars!

B.1124 December 6, 2019 — Bhubaneswar, India

I sincerely support this campaign

B.1125 December 6, 2019 — Utica, MI

I hate these over bright headlights so much. They cause instant headaches for me. When I am on a two-lane road and vehicles with LED lights are coming at me I am completely blinded I cannot see my lane or anything else, it's like drivers always have their brights on but even more intense.. These are so dangerous and we do not need this technology. Whoever invented this and allowed it to be put in vehicles is an idiot and I find this grossly negligent, because it's so blindingly dangerous for other drivers. Have you ever been in a car and then a high truck is coming at you with these hideous lights? you can't see a thing. It's bad enough when it's just a regular car coming at you with the Hideous lights. The trucks are ten times worse because they're higher and there is no escaping the light beam, and their headlights are generally larger than a car. There was nothing wrong with the old style headlights. Anything on that blue Spectrum should be completely banned. There should also be a petition to the automaker's to stop putting these in cars.

B.1126 December 7, 2019 — Rising Sun, MD

There is no real need for high intensity headlights. They are dangerously blinding on all vehicles, but particularly so on SUVs and pickup trucks. I used to enjoy night driving, but avoid it as much as possible now solely due to these ridiculously strong headlights.

B.1127 December 7, 2019 — Sterling Heights, MI

I'm concerned about safety and I hate these headlights!

B.1128 December 8, 2019 — Peoria, AZ

Except for motorcycles and emergency response vehicles, there is absolutely no need for this kind of blinding presence.

B.1129 December 10, 2019 — Middletown, NY

Please do something, these new lights are painful. I was behind an Escalade and the brake lights made my eyes so uncomfortable I had to look to the side. Seniors who are beginning to get cataracts will have acceleration of the condition. This is a crisis.

B.1130 December 11, 2019 — CHARLESTON, WV

They are way too bright and can not see anything because of them

B.1131 December 11, 2019 — London, United Kingdom

Frustrating how bright some of these flashy car lights are, unfortunately it won't be long before there's more collisions on our roads, due to this issue.

B.1132 December 12, 2019 — Island Pond, VT

The lights are too dang bright!

B.1133 December 12, 2019 — elgin, IL

I've had a run in with the insanely bright headlights.

B.1134 December 13, 2019 — Chelmsford, MA

LED lights are a huge hazard and impair drivers

B.1135 December 13, 2019 — Glendale, NY

It's is getting more difficult to drive at night as more and more cars have these overly bright headlights.

B.1136 December 13, 2019 — Middle Village, NY

I'm tired of being dangerously blinded by these headlights

B.1137 December 13, 2019 — New York, NY

I am afraid to drive at night because of the glaring headlights on the other side of the road. It is extremely dangerous and frightening

B.1138 December 14, 2019 — Ferndale, CA

These lights are very distracting causing me to not even want to look at a vehicle and see which way it is going which is obviously a dangerous reaction... But, I would like to avoid migraines and loss of my direction by looking at them. Please make them illegal!

B.1139 December 14, 2019 — Leesburg, FL

I want to be able to drive at night safely

B.1140 December 15, 2019 — Honolulu, HI

The lights have been hurting my eyes since their production in the market. Thank God for this petition.

B.1141 December 15, 2019 — Orangeburg, NY

I want the NHTSA and The USDOT AND Transport Canada to ban Daytime Running Lights (DRLs) because they do more harm than good, especially for those who are nearsighted and those with low vision impairments. DRLs cause glare for drivers in broad daylight, and it causes problems for people who forget to switch the regular headlights at night resulting in the rear taillights not coming on. PLEASE BAN DAYTIME RUNNING LIGHTS!!!!!

B.1142 December 15, 2019 — Queens, NY

They cause hazards to oncoming drivers who cant see!

B.1143 December 15, 2019 — University Place, WA

#banblindingheadlights

B.1144 December 15, 2019 — University Place, WA

I would bet that many accidents already have been caused by those dangerous blinding headlights!

B.1145 December 16, 2019 — Bowmanville, Canada

I'm a pedestrian and don't want to get hit by someone blinded by these lights.

B.1146 December 16, 2019 — Canada

I have almost driven off of the road (mountain clifside roads in BC!! Not just little ditches) on more than one occassion due to oncoming traffic with these lights. Even in otherwise perfect driving conditions.

B.1147 December 16, 2019 — Canada

Not quite so bright is a safety necessity.

B.1148 December 16, 2019 — Portland, OR

It's getting generally harder and harder to see at night because of them. They create excessive glare, which makes it very difficult to see pedestrians, particularly in winter, when it's dark most of the time and generally gloomy and rainy. I have stopped using my mirrors completely, which is itself disorienting and makes me feel insecure, but at least I'm not being blinded by the people behind me. These things are becoming standard on more and more cars, and now we're seeing them on large

trucks, as well as Semis and delivery vans, all of which have much higher profiles than a car, which means it′s impossible to aim them so that they are both a functional light source and also not blinding to other drivers. To make matters worse, we are also now seeing police and fire & rescue vehicles equipped with them as well. These are ″safety″ vehicles; city owned and tax payer funded safety vehicles. The irony of HID headlights on a safety vehicle would be amusing if it weren′t outrageous. I hasten to add that they are also appearing as standard on city buses and city work trucks. Between this and the safety vehicles, it seems clear that local and regional governments are perfectly fine with these lights and don′t care what they do to the people they protect and serve. People claim they feel safer with these headlights. That′s all well and good, but that sense of safety comes at the direct expense of someone else′s. If you use these headlights, one could even say that you are stealing someone else′s sense of safety and then selfishly and carelessly using it to beef up your own sense of safety. Under any other circumstance, would you be okay with someone stealing something which makes your life better so that they can make their own life just a little better still? I′m guessing no, you wouldn′t. So, why expect anyone else to be okay with it? And what kind of person are you that you′re okay with it? These headlights need to disappear from the face of the earth, but honestly, no matter how much we complain, I don′t believe the DOT really cares all that much about it. I wouldn′t even be surprised to find official DOT vehicles are all now equipped with them because that′s just how the new fleet vehicles come from the dealership.

B.1149 December 16, 2019 — San Jose, CA

Glad someone has taken this issue on. Driving at night has became a difficult task. There needs to be a ban on led headlights.

B.1150 December 16, 2019 — Trenton, NJ

I can′t see when it′s dark out and also never can see blinker with them

B.1151 December 17, 2019 — Kamloops, Canada

These types of headlights hurt my eyes and have impaired my vision so much so that I feared I′d drive off the road!!! They most certainly should ot be allowed my any means!!!

B.1152 December 17, 2019 — Washington, UT

I’m a retired aerospace engineer with 28 years experience in system safety engineer and management for DOD, NASA, Jacobs and Northrop Grumman. There is no “might be” with glare. Glare is a very well known Category I hazard causing “death or system loss.” The only two reasons allowing this to happen are incompetence or criminal behavior. Pick one and fix it.

B.1153 December 18, 2019 — Greenville, SC

I wear blue blockers throughout the day and have found they also work on the super bright headlights. Without them I find the lights extremely blinding, making it extremely difficult to drive. I think they should be banned globally. They also mess up our circadian rhythms.

B.1154 December 18, 2019 — Paisley, FL

I am signing this because these lights kill my eyes and I myself have a hard time driving when these LED headlights pass me head-on! Even during the daytime! These are dangerous and must be made illegal!

B.1155 December 18, 2019 — Sonoma, CA

It’s so hard to see the lines on the road when the lights are so bright. You can’t see anything. It’s so scary and I believe those lights cause accidents and should be band.

B.1156 December 18, 2019 — Vallejo, CA

Years ago, anyone driving at night could tell if a car had on their high beams or low beams. Low beams did not blind other drivers. High beams did. It was illegal to blind other drivers with high beams. What do we do today when all low beams are now HIGH BEAMS? Those who allowed this to happen must be identified. Who signed off on allowing low beams to become high beams? The car manufacturers could not put high beam lights on cars, and call them low beams, without legal authorization. We have recalls in this country when cars are made unsafe. Recall ALL HIGH BEAM CARS MASQUERADING AS LOW BEAM CARS! The science used to identify low beams vs. high

beams has been seriously compromised. What ever happened to lumens? Is there no yardstick to quantify the illumination a car headlight emits today? Are we a nation of idiots? How many years has this been going on for? Why are we even talking about this today? Is this going to be a PERMANENT problem with no solution whatsoever? I am really tired of signing WORTHLESS petitions that give me no reason to believe ANYTHING will change. Who is Donald Berry anyway?

B.1157 December 19, 2019 — Humble, TX

It is true. As an older driver they do blind me at night. Back streets are what I drive on

B.1158 December 21, 2019 — Stanford in the Vale, ENG, United Kingdom

Unhealthy unpleasant lights, LED streetlights are harsh and harmful and the ones on cars are a danger to driving.

B.1159 December 22, 2019 — Australia

Light pollution is ruining everything.

B.1160 December 22, 2019 — Green Bay, WI

Those lights are ridiculous and deadly!!!

B.1161 December 22, 2019 — Knoxville, TN

I don't like being blinded while trying to drive safely.

B.1162 December 22, 2019 — Northport, NY

The lights are too bright and the emergency vehicle's are even worse

B.1163 December 22, 2019 — Port Jefferson Station, NY

I have always found it difficult to drive at night with the oncoming headlights blinding you

B.1164 December 25, 2019 — Satellite Beach, FL

Literally blinds me every time I'm on the road and when I see these bulbs. Not to mention the owners are usually pretty aggressive knowing that they have weaponized their car's headlights against all other drivers since even without brights on, the lights are blinding. I was once flashed by an aggressive driver who owned either HID lights or LED's and I legitimately lost vision while I was trying to operate my car because some cretin let his ego overpower his reasoning on the road.

B.1165 December 25, 2019 — Sterling, IL

Technology is becoming the enemy. LED lights not only blind the driver, but also give me a massive migraine. The rear view mirror cannot even help darken the lights of the driver behind you, I have to pull over and let them pass in order to see. It is impossible to see deer crossing the road with the lights blinding you.

B.1166 December 26, 2019 — Granite city, IL

Pretty much anytime I am driving and a car that has these halogen light pulls up behind me I'm blind and unable to see the road or anything inside my car. They need to be illegal.

B.1167 December 26, 2019 — Nashville, TN

It's dangerous

B.1168 December 26, 2019 — St. Louis, MO

Halogen headlights are going to kill somebody, someday.

B.1169 December 27, 2019 — Jacksonville, FL

These lights are awful!! I'm sure they've caused wrecks

B.1170 December 27, 2019 — Sacramento, CA

Don't blind oncoming traffic!

B.1171 December 27, 2019 — South Anston, ENG, United Kingdom

Not only are lights getting brighter but drivers are driving permanently at night on full beam until blinded back

B.1172 December 28, 2019 — Monson, MA

Like many others I am blinded by on coming vehicles with LED headlights, and I find it impossible to drive with those headlights behind me. Please ban these headlights for the safety of all on the road.

B.1173 December 29, 2019 — Eastlake, OH

These lights cause blind spots and more accidents are occurring

B.1174 December 29, 2019 — Houston, United States

They are dangerous and distracting.

B.1175 December 30, 2019 — Greensboro, NC

Those lights are wack.

B.1176 December 30, 2019 — Lynnwood, WA

LED is Dangerous for everyone! Especially people who are light sensitive! Please ban these on ALL headlights!

B.1177 December 30, 2019 — Seattle, WA

I cannot see the road when these headlights cone at me. At barely 65 I am looking at having to stop driving at night.

B.1178 December 30, 2019 — Stanway, ENG, United Kingdom

I know what it′s like when your blinded by these led lights.

B.1179 December 31, 2019 — Denver, CO

Headlights that bright can cause visibility issues as they are as bright as high beams.

B.1180 December 31, 2019 — Frederick, MD

There are lots of old cars with new LED /HID lights too. These should be banned too.

Comments left in 2020

January 2020

B.1181 January 1, 2020 — Consett, ENG, United Kingdom

Becoming dangerous

B.1182 January 1, 2020 — Post Falls, ID

It is becoming increasingly difficult to drive at night, thus it affects my freedom. In what universe is it safe to blind a driver in a car that is coming toward you. Additionally, owners of these cars need to address the issue and have some empathy for those of us being blinded by their lights.

B.1183 January 2, 2020 — Mauldin, SC

These headlights are blinding and dangerous to on-coming drivers. Who ever thought mega-bright lights that could be seen from space was a good idea?

B.1184 January 2, 2020 — Meadville, PA

I hate theses things we don’t need to see bugs having sex!!

B.1185 January 2, 2020 — Niles, OH

These lights blind so many people at night when driving. They even blind the passengers as well.

B.1186 January 2, 2020 — United States

I am so tired of having to pitch my sideview mirrors off the road because of these solar flares burning a hole in my peripheral vision.

B.1187 January 2, 2020 — VALPARAISO, IN

The lights blind me

B.1188 January 2, 2020 — Voorheesville, NY

LED lights are known to cause injury to the photo receptors of the eyes! No government, industry or otherwise has the right to expose us to a product that causes injury. No excuse or explanation is acceptable to justify risking our eyesight! This is an outrageous agenda with companies such as Regeneron waiting to offer a solution after many people develop eye problems from this kind of light exposure. This agenda needs to be stopped!

B.1189 January 3, 2020 — Chicago, IL

street and auto LED lights are way too bright.

B.1190 January 3, 2020 — Exelsior springs, MO

because I have a hard enough time seeing at night with out them darn things in my eyes

B.1191 January 3, 2020 — Oak Park, CA

I have a small car, and can't seem to drive anywhere at night without a taller car or tuck with ridiculously bright lights practically blinding me.

B.1192 January 3, 2020 — United States

Led head lights blind both drivers and passengers in both oncoming traffic as well as traffic that drives behind your vehicle that bounces off of both sideview and rearview mirrors.

B.1193 January 4, 2020 — Hialeah, FL

To save lives one of which may be your own

B.1194 January 4, 2020 — Pittsburgh, PA

I won't even drive at night anymore because of these lights!!

B.1195 January 5, 2020 — Brooklyn, NY

Michael McGuinness

B.1196 January 5, 2020 — Swansea, WLS, United Kingdom

Shining an LED light directly into someone's eyes is assault, be it a car headlight or a bright LED torch.

B.1197 January 5, 2020 — Yonkers, NY

The lights blind you, that's the whole story!!!!

B.1198 January 6, 2020 — Rugeley, ENG, United Kingdom

Not only might these lights cause accidents, they damage the retina and confuse your body clock.

B.1199 January 6, 2020 — iow, ENG, United Kingdom

Blinded by these lights all the time

B.1200 January 7, 2020 — West Kirby, ENG, United Kingdom

Also the LED streetlights are very danderous to drive to, not to mention harmful to health and the environment. This roll out also needs to be stopped.

B.1201 January 9, 2020 — Carmel, IN

The cap on how bright manufacturers can make the auto headlamps needs to be now. More public info and news stories need to be instigated to make public aware of how damaging the LED beams are to the human eyes and how to get mechanical adjustments made to their vehicles, and to understand the auto on, auto dim, and manual switches.

B.1202 January 9, 2020 — Leeds, ENG, United Kingdom
Is deadly stupidity. Wake up you fashion victim sheep.

B.1203 January 9, 2020 — San Antonio, TX
LED headlights blind me when driving at night.

B.1204 January 9, 2020 — Warminster, PA
I have photosensitive following a brain injury. I can no longer safely drive at night or during increment weather in fear of triggering a intense migraine. I miss my freedom, ban these headlights and save lives!

B.1205 January 9, 2020 — las vegas, NV
These lights are a danger

B.1206 January 9, 2020 — saint louis, MO
Those lights are dangerous!

B.1207 January 11, 2020 — Rushville, IL
I can no longer drive safely at night due to these led lights. Both oncoming lights and rearview mirror reflection are blinding.

B.1208 January 12, 2020 — Carmel, IN
I agree! These are a nuisance! They don't only hurt my vision, but also anger me.

B.1209 January 13, 2020 — De Soto, KS
Judith Albright

B.1210 January 14, 2020 — Hallsville, TX
They make it extremely dangerous for oncoming traffic

B.1211 January 14, 2020 — Utica, NY
It's TRUE some headlights are to bright

B.1212 January 15, 2020 — New Orleans, LA
These headlights are blinding and should be banned!

B.1213 January 15, 2020 — Uddevalla, Sweden
I get blinded now and then...

B.1214 January 16, 2020 — Hudson, NH
I agree!

B.1215 January 16, 2020 — Yorba Linda, CA
The lights blind me so much that I cannot see well while driving. I am scared it will cause me to get into an accident!!!! Ban them please!!!!!!!!!

B.1216 January 17, 2020 — Nashua, NH
I hate bright headlights blinding me

B.1217 January 17, 2020 — Nashville, TN
I'm tired of being blinded by these obnoxious lights. They are a danger to everyone on the road.

B.1218 January 19, 2020 — Maiden, NC
They blind you

B.1219 January 19, 2020 — Montréal, Canada
These led lights are a true hazard! They make it really hard to focus once blinded by them on the road and can be dangerous

B.1220 January 20, 2020 — Hopkinton, MA

These high intensity life lesson lights make night driving more dangerous. My eyes are temporarily blinded by their brightness when b I drive at night.

B.1221 January 20, 2020 — Leverett, MA

Please remember that a MAJORITY of our population consists of folks over age 55 who are beginning to need cataract surgery and/or may be experiencing macular degeneration. Let's keep everyone's eyes HEALTHY by banning LED lights in/on motor vehicles. It may even save the eyes of millennials!

B.1222 January 20, 2020 — White Oak, PA

I can't drive at night now because of them.

B.1223 January 20, 2020 — Yarmouth, ENG, United Kingdom

Light pollution is a big problem and car headlights are getting brighter every year. It's hard to see where you are going when they pass you.

B.1224 January 20, 2020 — black diamond, WA

The vehicle that finally pissed me off enough to join this fight was a newer ford pickup. F-250 i think. Not only are the headlights ridiculous but the front is covered with about 100 smaller LEDs , The smaller ones apparently just for decoration. It was also lifted quite high making it clearly in violation. The lifts are often factory these days. My point is this vehicle was factory equipment. Time for us to go after the manufacturers as well.

B.1225 January 22, 2020 — Round Rock, TX

I've gotten pulled over because I was swaying on road because idiot behind me was blinding me, which was a cop. He asked why I was driving in such a manor and I explained why and I was let go. It does distract drivers and blinds us.

B.1226 January 22, 2020 — St-Eustache, Canada

From Québec, Canada HID & LED should be banned off our roads. A lot of the headlights on vehicles are not properly installed and shouldn't be over a certain amount of lumen in the LED lights of a vehicle. Some vehicles may almost be go compared as a Christmas tree, so much that they have at least 2 HID/LED headlights one above the other and not to mention that they also have an LED string around them. These are blinding for others on the road. If they were low mounted like the Fog lights, it wouldn't be such an issue but literally everyone has to turn their heads away from the road when passing by. I compare them as if, you were looking up to the sun for a few second and then trying to focus... we are clearly blinded. Nowadays, trucks, buses and pickups has them and they're all just at the face level because regular automobiles are lower. Not to mention that when they follow you, the inside of your car is completely lighted up. They should be a law against this, and or make sure that the lights on each vehicle are properly installed by its manufacturer only. The beam lights should be at a proper level within the original casing that fits with the car and should not be install by other then the manufacturer themselves It's enough, a lot of people can no longer take these.

B.1227 January 23, 2020 — Proctor, AR

I'm signing because I live out in the middle of nowhere with no other lights on the road, and I know I am not able to see anything else when I see these headlights come at me.

B.1228 January 24, 2020 — Roslindale, MA

Way too bright! Dim them down. Blind me when they are driving in back of me or when in front. Scary.

B.1229 January 25, 2020 — Manistee, MI

These headlites should have never been allowed on vehicles!!!

B.1230 January 25, 2020 — Roanoke, IL

I hate led head lights they blind me from being able to see the road

B.1231 January 25, 2020 — Tulsa, OK
I don't see well at night and brights coming toward me is hazardous.

B.1232 January 25, 2020 — Tulsa, OK
Zondra Clunn

B.1233 January 25, 2020 — Washburn, IL
When bright LED lights coming towards you are the only lights you can see at night in the country, you basically go blind.

B.1234 January 26, 2020 — Atherton, CA
I can't tolerate the glaring headlight beams at night. !!!!!

B.1235 January 26, 2020 — Fernley, NV
My wife is so blinded by these new lights that she's just about given up driving at night. Please stop the madness!

B.1236 January 26, 2020 — Hamburg, NY
I am blinded by them. Very dangerous.

B.1237 January 26, 2020 — London, ENG, United Kingdom
It needs addressing

B.1238 January 26, 2020 — Newark, DE
I'm professional truck driver and the lighting systems that are being used in newer model vehicles and commercial trucks also have in many occasions caused me to have to brighten my headlights in order for me to be able to see the road that I'm traveling on. That's because the glare cause by these types of headlights on my windshield is blinding me, specially at times when it's raining (at night) or after it finishes raining and the roads are still wet.

B.1239 January 26, 2020 — Oakland, CA
I thought only older drivers were impacted by these brighter headlights but it's ALL drivers. These headlights are just too bright and the flat is endangering other drivers.

B.1240 January 26, 2020 — Oakland, CA
Overly bright vehicle lights cause me eye pain and headaches. We need a national standard for head lights and tail lights in the subject of brightness.

B.1241 January 26, 2020 — San Francisco, CA
I am signing because the glare of these lights at night make it impossible to see pedestrians crossing the street.

B.1242 January 26, 2020 — Sanford, FL
I hate people who drive around at night with high beam headlights.

B.1243 January 26, 2020 — Shawnee, KS
Early bird

B.1244 January 26, 2020 — Stockton, CA
Blinding headlights make the roads dangerous for everyone especially in poor weather conditions. They make it hard for me to see the lines on the road or watch for bikes and pedestrians. I don't want to injure anyone or be injured.

B.1245 January 27, 2020 — Hollister, CA
This issue is out of control. About half of the vehicles are so bright even looking to the right edge of the road doesn't help. I'm not usually in favor of over regulation, but something must be done to stop the selling of these dangerous lamps.

B.1246 January 27, 2020 — House Springs, MO

Newer vehicles have lights around the headlights, the running lights are bright white, is there no regulation or restrictions on how bright they can be as long as there technically

B.1247 January 27, 2020 — Pipestone, Canada

They are dangerous to others !

B.1248 January 27, 2020 — Sunnyvale, CA

I've experienced problems with the new headlamp brightness over the past few years.

B.1249 January 27, 2020 — West Columbia, SC

They need to ban aftermarket LED lighting kits. Those are the true hazard.

B.1250 January 27, 2020 — egg harbor, NJ

Police cars need to be included in this. Their lights are seriously blinding drivers. I worry that when I see police lights, I cannot see anything but their lights. Very dangerous.

B.1251 January 28, 2020 — Morrow, GA

Agreed, when they keep all of their outside car lights on it's blinding even looking the opposite direction because they reflect off of everything

B.1252 January 28, 2020 — Villa Park, IL

LED headlights are the WORST! They blind everyone on the road and are extremely dangerous in snow and rain!

B.1253 January 28, 2020 — elwood, NY

As a car travel down the road and the light beam moves with the road the increasingly brighter lights get more and more dangerous as the beam passes over the driver. I've noticed it with many newer cars a half mile or more down the road and the light are blinding.

B.1254 January 29, 2020 — Bennington, VT

I agree light are to bright especially LED light some times i have to slow right down to 10mph from like 50mph

B.1255 January 29, 2020 — Dallas, TX

I shouldn′t be blinded by a car′s headlights when they are 30 yards behind me in another lane.

B.1256 January 29, 2020 — Lynn, MA

LorettaWongus-Carter

B.1257 January 29, 2020 — Lynn, MA

These lights are so dangerous. I can′t″r even make out the road because I just see bright lights. I try to avoid driving at night because of this. It′s Terrible

B.1258 January 29, 2020 — Media, PA

These lights are accident prone. Blinding and should be illegal.

B.1259 January 29, 2020 — Newbury, MA

I agree. Dangerous to all. Trucks with these lights are blinding. Lights do not have to be this bright for adequate sight. Adding fog lights to cars can help without blinding.

B.1260 January 29, 2020 — St-Eustache, Canada

HID & LED should be banned off our roads. A lot of the headlights on the vehicles are not properly installed and shouldn′t be over a certain amount of lumen in the lights of a vehicle. I would compare some vehicles like a Christmas tree, so much that they have up to 2 HID/LED headlights one above the other on each side and not to mention that they also have an LED string around them for decoration. These are just blinding for others. If they were low mounted like the Fog lights, it wouldn′t be such an issue but unfortunately we literally have to turn our heads away from the road when passing by. It′s like when you look up to the sun for a second and then try to refocus... we are

clearly blinded. Nowadays, trucks, buses and pickups has them and they're all at the face level because of the hight. Not to mention that when they follow you, the inside of your car is completely lighted up. They should be a law to make sure that the lights on each vehicle are properly installed and only by its manufacturer. The beam lights should be leveled within the original casing of the car brand and should never be installed by others. It's enough, a lot of people can no longer take these. Here are the regulation in Quebec, Canada. https://saaq.gouv.qc.ca/en/road-safety/modes-transportation/automobile/modified-cars/xenon-headlights/

B.1261 January 29, 2020 — Virginia Beach, VA

It's important to save lives

B.1262 January 29, 2020 — Winchester, MA

This is a preventable, dangerous situation.

B.1263 January 29, 2020 — Woodford, VT

These headlights are very dangerous to motorists whether they are coming at you or behind you you literally can't see! At night is the worst time!

B.1264 January 29, 2020 — portsmouth, NH

It's dangerous and blinding, it's worse than high beams !!!!

B.1265 January 30, 2020 — Las Cruces, NM

Slowly but surely I'm feeling forced to drastically reduce and/or completely stop my night driving because of these ridiculously dangerous headlights. Maybe some night the only vehicles on the road will be those using these type headlights & they can just blind each other!

B.1266 January 30, 2020 — Stratham, NH

Night time is a difficult time for me to drive at Baseline. When those bright bright lights are coming at me I am blinded. When the lights are behind me I am distracted as I use my left hand to cover my driver's side mirror

B.1267 January 31, 2020 — Big Laurel, KY

They blind oncoming driver and going to cause a lot of wrecks and fatalities

B.1268 January 31, 2020 — Chicago, IL

Headlights are extremely blinding!!!!!! Please do something!!

B.1269 January 31, 2020 — Felixstowe, ENG, United Kingdom

I'm sick to death of being blinded.

February 2020

B.1270 February 2, 2020 — Princeton, WV

If you need headlights that bright to see to drive, you don't need a driver's license.

B.1271 February 3, 2020 — Toronto, Canada

I'm blinded every night coming home from work. People need to at the very least limit their use of the "high beam"

B.1272 February 4, 2020 — Columbus, OH

I have to drive every night in the dark and it's awful if it's a truck with these lights behind my car because then I definitely can't see! These lights are horrible and should never have been allowed to be installed. Now Sylvania has a commercial talking about how great they are and it makes me want to scream

B.1273 February 4, 2020 — Duquesne, PA

I drive to work each morning around 6:15am when it is still dark out. Most mornings my view is obstructed or impeded by someone approaching me or following me with those dangerous LED

headlights and it is especially dangerous in wet weather conditions when the lights reflect off of the wet pavement.

B.1274 February 4, 2020 — Fredericksburg, VA

These lights are a hazard.

B.1275 February 4, 2020 — Glasgow, SCT, United Kingdom

My brother is suffering with this problem and many others I know

B.1276 February 4, 2020 — Tinton Falls, NJ

I can only see spots after that BMW blinded me.

B.1277 February 4, 2020 — West Long Branch, NJ

Carolyn Barnes

B.1278 February 5, 2020 — London, Canada

These lights may make the 1 person driving the vehicle with them installed feel more safe but the other 50 or more cars that they drive past (oncoming) are blinded! I can't count how many times i haven't been able to see or had to squint or even close my eyes because the brightness is so intense. Or when they are behind me, the whole cab of the truck lights up and every side mirror and rear-view mirror makes it even worse, the lights hit me from everywhere!

B.1279 February 6, 2020 — Dupo, IL

I signed because they are blinding and lately drivers are in such a hurry that they will sit with these blinding white leds on behind you till you speed up way past the speed limit and 5 miles over limit that cops allow

B.1280 February 6, 2020 — Dupo, IL

I agree with the potintioner 100% we are being blind by the bright LEDs when obeying the law.

B.1281 February 6, 2020 — Rushworth, Australia

These LED headlights are blinding oncoming traffic. They are brighter than most high beams and people will be blinded and run off the road and be killed.

B.1282 February 8, 2020 — Santa Cruz, CA

These lights BLIND ME

B.1283 February 9, 2020 — Oldsmar, FL

Not just LED headlights, but also LED streetlights!

B.1284 February 9, 2020 — Sobieski, WI

Incandescent bulbs are safe and have proven to be safe for many years LED bulbs blind incoming traffic and blind from behind perhaps the driver with the LED bulb can see better but the people around them have to have their eyes hurt as a consequence I could see these causing many accidents.

B.1285 February 9, 2020 — Toronto, Canada

too damn bright for us older drivers. We're already at a disadvantage.

B.1286 February 10, 2020 — Grand Isle, U.S. Outlying Islands

It's truly a Hazzard.. especially in our small towns.. you hget blinded

B.1287 February 10, 2020 — Portsmouth, United States

I am struggling to drive at night. I find it hard to tell if someones high beams are on or not. I hate the new led lights. They are just too bright

B.1288 February 10, 2020 — gig harbor, WA

I have spoken with several individuals of all ages who complain about the brightness causing distortion. It doesn’t matter your age. They are a hazard to driving

B.1289 February 11, 2020 — Augusta, ME

These lights are extremely dangerous and blinding to other drivers at night and during the day. There is no good reason or applicable safety reason to allow these lights on vehicles. Please listen to the data and to the AMA and ban LED lights on all motor vehicles.

B.1290 February 11, 2020 — Bellingham, WA

Those lights are horrible.

B.1291 February 11, 2020 — Bellingham, WA

They cause me to not be able to see for several seconds after one of these vehicles passing by me at night.

B.1292 February 11, 2020 — Magalia, CA

The new lights are blinding and distracting. They make driving by more difficult and have made greater the possibility of driving accidents and fatalities. Please outlaw these!

B.1293 February 11, 2020 — Sonora, CA

Carol Fairchild

B.1294 February 12, 2020 — Akron, OH

I have Lupus. Anytime I come across these headlights.. I AM BLINDED! My life and those around me are in danger. Whoever came up with these needs slapped!

B.1295 February 12, 2020 — Cheshire, United Kingdom

Yes, I almost hit a cyclist (riding with no lights) last night because I was blinded for a few seconds.

B.1296 February 12, 2020 — Cheshire, United Kingdom

I try to avoid driving at night these days - they are bliding and so dangerous. Surely the people who design them must be aware when they are driving themselves. Yes, it's impossible to tell if they are on beam or dipped. Even when dipped they are more blinding that the older lights are on full beam.

B.1297 February 12, 2020 — Cheshire, United Kingdom

And traffic lights

B.1298 February 12, 2020 — Cheshire, United Kingdom

I agree, although I never had/have a problem seeing with my old style lights.

B.1299 February 12, 2020 — Cheshire, United Kingdom

Yes, I almost hit a cyclist (riding with no lights) last night because I ws blinded for a few moments by oncoming traffic with those awful lights. Honestly, sometimes they literally make my eyes feel like they are burning.

B.1300 February 12, 2020 — Cheshire, United Kingdom

These lights even on dipped are much worse than old style lights ever were on full beam!

B.1301 February 12, 2020 — Dallas, TX

Please join our new Facebook group to further discuss news and research about the dangers of HID and LED headlights. I am happy to see how many people have signed this petition and I hope we can continue to collaborate to get headlights regulated appropriately. The group is called "Are LED Headlights Dangerous?"

B.1302 February 12, 2020 — United States

I agree with this the facts in this petition. These type of headlights are very dangerous.

B.1303 February 12, 2020 — milton, FL

The lights could at least be properly aimed. I flashed my lights once and the oncoming vehicle really blinded me when they hit their brights !

B.1304 February 13, 2020 — Auxvasse, MO

퓛퓮퓲퓰퓕퓫 퓜퓸퓻퓻퓲퓻퓸퓷

B.1305 February 13, 2020 — Cocoa Beach, FL

This is truly a real problem!

B.1306 February 13, 2020 — Lenoir, NC

Blinding lights are dangerous and cause accidents everyday.

B.1307 February 13, 2020 — Marshall, WI

How the use of these blinding lights on motor vehicles on U. S. roads was ever allowed in the first place is a huge miss / failure on the part of the government agencies meant to protect us. Their increasing use on tractor trailers cabs - where the headlights are higher and therefore more blinding - make this issue even more urgent. And as an avid walker as well as driver, I have to cover or shield my eyes from oncoming traffic at night because of the insane intensity of these new lights. Let's please roll back this technological advance to some kind of sane permitted national standard that doesn't offend / disable oncoming drivers and other users of our roads.

B.1308 February 13, 2020 — TX, United States

Bright LED lights are blinding for me and give me terrible headaches, which have made it nearly impossible for me to drive at night.

B.1309 February 14, 2020 — Canada

the old halogen headlights are the only things making our roads vibrant, headlights should only be at least 2700k or lower thank you

B.1310 February 14, 2020 — Fort Scott, United States

I am easily blinded at night now.

B.1311 February 14, 2020 — Hastings, MN

I have been blinded several times my these new headlights and don′t understand how car manufacturers can possibly claim they are safe. Especially when they′re on a truck!

B.1312 February 14, 2020 — Hogansville, GA

It′s hard enough to drive at night and then to be blinded by theses lights.

B.1313 February 14, 2020 — Ringgold, GA

I am tired of being blinded by those super bright lights.

B.1314 February 14, 2020 — Sulphur, LA

I have astigmatism. I have to actively close my eyes any time someone has these.

B.1315 February 14, 2020 — Toronto, Canada

These headlights blind me at night, and trigger some truly horrible headaches as well.... that′s not safe on the road, night driving is hard enough to begin with.

B.1316 February 15, 2020 — Acampo, CA

These lights must be eliminated for the sake of public safety. The blinding brightness of these lights are typically as bad as high beams at night, only full time! Personally dealing with this at night on two lane country roads, is aggravating and so unsafe. It makes no sense for lights to be this bright, much less legal.

B.1317 February 15, 2020 — Barrington, NH

I hate the white lights! So hard to see at night when they are coming at you!!

B.1318 February 15, 2020 — Fresno, CA

Nothing worse than blinding headlights Please ban the use of them

B.1319 February 15, 2020 — Galt, CA

Gloria Donaldson

B.1320 February 15, 2020 — LA, CA

Driving at night is becoming a dangerous ordeal. Cars headlights are too bright and i find i need dark glasses to dim the impossible non stop glare. Same foes for the red lights. It must be addressed.

B.1321 February 16, 2020 — La Mesa, CA

The headlight situation has become debilitating at times. If I get into an accident because of being blinded by the intensity of headlights, who is to blame? Will I be at fault? Will the car that's pulled up behind me and hauls A— after I crash, will they stick around so I can get their info??? Hardly!!! What are we to do??? HOW HAVE THESE BECOME LEGAL??????

B.1322 February 16, 2020 — Pittsburgh, PA

If you buy a new car and don't remove the new blinding ones you are part of the problem.

B.1323 February 17, 2020 — Lagrange, GA

I'm signing cause I CAN'T SEE with these things glaring into my car. Even if you reposition mirrors they are still blinding and a total distraction.

B.1324 February 17, 2020 — Llandrindod Wells, United Kingdom

I'm one of thousands who no longer drives in the dark due to being blinded by modern car headlights on twisting country roads! I'm a confident and competent driver and feel I am sadly losing my freedom due to this common issue. Lorries lit up like Christmas displays are a danger too as many drivers are distracted from concentrating on the road by their fancy lights!

B.1325 February 17, 2020 — MILFORD hz, WLS, United Kingdom

I agree

B.1326 February 17, 2020 — Salisbury, NC

These lights are terrible.

B.1327 February 18, 2020 — Fort Myers, FL

I'm tired of being blinded and I don't want to have an accident caused by said blinding. There are high beams and low beams for a reason... so you don't blind people driving on busy streets and cause accidents.

B.1328 February 18, 2020 — Ladoga, IN

These lights are dangerous. They literally blind me.

B.1329 February 18, 2020 — Liverpool, United Kingdom

I have regularly been blinded while driving passengers at work. And in my own vehicle. They are dangerous no argument about this fact. The end.

B.1330 February 18, 2020 — Sugar Grove, IL

I'm constantly being blinded by the LED

B.1331 February 19, 2020 — Longs, SC

I am sick and tired of being blinded at night because of these ridiculous headlights. Not only are they annoying and glaring but they are dangerous to drivers. They need to be gotten rid of!

B.1332 February 19, 2020 — Portland, OR

I have been close to blinded by these strong lights and almost went off the road many times. I'm starting to be anxious about driving at night and that is very limiting.

B.1333 February 20, 2020 — Deal, ENG, United Kingdom

I'm angry my driving is being impaired by on coming cars with led lights. It must be banned

B.1334 February 20, 2020 — Worcester, PA

I am an optometrist. LED headlights are causing problems for drivers of all ages. In my younger patients the LED lights cause them to over focus and their eyes suddenly act a lot more nearsighted, in older eyes blue light scatters more than any other wavelength of light. See my journal article for further info: https://www.reviewofoptometry.com/article/seeing-blue-the-impact-of-excessive-blue-light-exposure

B.1335 February 21, 2020 — Detroit, MI

The headlights, taillights, LED signs are blinding and dangerous. First responder vehicle lights are exponentially more bright. Unnecessarily bright at night. I'm afraid it will cause more accidents as people must look away in order to preserve sight

B.1336 February 21, 2020 — Lancaster, CA

These headlights are so dangerous. Gotten to the point I can't even drive at night. They just totally blind you. People have survived with regular headlights for many years why do we need these things that are going to cause accidents?

B.1337 February 21, 2020 — Reno, NV

I can not drive at night any longer because of the outrageously bright headlights! If I do, I usually get a bad headache and I am sick of it! Bright headlights are dangerous and uncalled for!

B.1338 February 21, 2020 — watertown, MA

They are so dangerous with the extreme contrast at night, between the headlights in front, behind, maybe addl sides, you lose the grey areas...like pedestrians, cyclists, scooters, skateboads, motorcycles, kids, dogs; even other cars nearby in your rearview disappear on a multi-lane road. Add rain at night. Glare from the wet road reflecting these beams at now more angles really fully blinding most ppl, for maybe small amounts of time but that's all it takes for a person, dark winter coat, to step into a crosswalk. A lot of people dont feel safe driving, walking, cycling at night. I commute from city to suburb and it's harrowing most nights. They are migraine inducing as well. So how many ways do these things need to be a menace before they stop putting them in these cars? Who is responsible for accidents being caused by these poorly thought out and hazardous headlamps?!

B.1339 February 21, 2020 — watertown, MA

They are so dangerous with the extreme contrast at night, between the headlights in front, behind, maybe addl sides, you lose the grey areas...like pedestrians, cyclists, scooters, skateboads, motorcycles, kids, dogs; even other cars nearby in your rearview disappear on a multi-lane road. Add rain at night. Glare from the wet road reflecting these beams at now more angles really fully blinding most ppl, for maybe small amounts of time but that's all it takes for a person, dark winter coat, to step into a crosswalk. A lot of people dont feel safe driving, walking, cycling at night. I commute from city to suburb and it's harrowing most nights. They are migraine inducing as well. So how many ways do these things need to be a menace before they stop putting them in these cars? Who is responsible for accidents being caused by these poorly thought out and hazardous headlamps?!

B.1340 February 22, 2020 — Caspar, CA

I am really offended by overly bright headlights. It's hard to believe they are legal, considering how dangerous they are. I have to shield my eyes and hope I'm seeing enough to continue.

B.1341 February 22, 2020 — Duncannon, PA

I experience this everyday.

B.1342 February 22, 2020 — Elk Grove, CA

Im being blinded to the point of danger.

B.1343 February 22, 2020 — Sacramento, CA

Please ban all blue-light technologies on vehicles and keep tail-lights, brake-lights and turn signals at a maximum brightness no greater than that allowed for traffic signals.

B.1344 February 23, 2020 — Fresno, CA

Long over due

B.1345 February 23, 2020 — Los Angeles, CA

I can't tell you the number of times my vision got fucked because some guy went and installed bright ass LEDs on their headlights. Why these people aren't charged with reckless driving or whatever is outrageous. Most all of them don't even have the decency to get the lights calibrated to be tolerable on the road. It's worst than getting tailgated, because atleast with tailgating I can fucking see

B.1346 February 23, 2020 — Philadelphia, PA

So glad there's a petition for this. Just within the past year or so this has become more noticeable and it's becoming a big problem. They are so overly bright even when I'm not looking directly at them it seems like there's a stadium light shining in my eyes. I have to use my hand to shield my eyes becuause the brightness is so harsh. I'm only in my 30's and wasn't expecting to have issues with driving at night for another at least another 20 years. It's not just a problem with car headlights either. Some street lamps in my area have been upgraded to LED and the glare from those hurts my eyes while driving too.

B.1347 February 23, 2020 — San Diego, CA

I'm signing because I am constantly blinded by these headlights lately. These are dangerous. I have to choose between either being blinded when a driver with these lights is behind me, or seeing out of my mirrors because the only way to see is to adjust my mirrors so that they reflect the light away from me. But this means that I cannot see out of my mirrors! Not only are these lights blinding, but they are also extremely agitating and distracting. This is not only affecting seniors and those with vision impairments. I am 27 with pretty good vision and I am struggling to drive at night when these lights are behind me.

B.1348 February 23, 2020 — Virginia Beach, VA

The new headlights greatly impact my night vision and create a hazard for drivers even if high beams aren't used.

B.1349 February 24, 2020 — Graham, NC

I personally hate these headlights! They aren't any more effective than the old fashion soft white headlights and the only thing they are good for is blinding other drivers and putting people at risk for crashing. Especially in the rain.

B.1350 February 25, 2020 — Los Angeles, CA

I'm a 63 yr. old full time driver who has come very close to hitting pedestrians due to being blinded by these super bright lights. I feel that many (immature) drivers use these lights as weapons, and get pleasure out of annoying others. I wanna do my part to help dial it back before more lives are destroyed.

B.1351 February 25, 2020 — San Francisco, CA, CA

I drive at night and these lights make it more difficult to see.

B.1352 February 26, 2020 — Birmingham, AL

Modern headlights especially ACURA, Honda and Toyota are to bright. They cause you to temporarily be blinded.

B.1353 February 27, 2020 — Alliance, NE

It is getting harder and harder to drive safely at night. In Nebraska, lots of people spend hours on the highway and I have almost been ran off the road meeting some of the vehicles with these lights. They also cause macular degeneration which is irreparable damage that causes blindness.

B.1354 February 27, 2020 — Eugene, OR

These bright lights are dangerous!

B.1355 February 27, 2020 — Lincoln, NE

I often notice the lights of oncoming cars are quite blinding and different from the lights that we have always seen. Please go back to the original headlights so that we do not have this be yet another road hazard. Thank you.

B.1356 February 27, 2020 — Mesa, AZ

Blue light spectrum is blinding, destroys your night vision, and completely unnecessary, all headlight should be yellow like how it was not even 15 years ago

B.1357 February 27, 2020 — NY, United States

I'm in favor of preventing light pollution and this is a big contributor. Not to mention the obvious potential for accidents and harm.

B.1358 February 28, 2020 — Berea, KY

I hate them they blind you

B.1359 February 28, 2020 — Goshen, IN

I can and I need to.

B.1360 February 28, 2020 — Union, MI

I'm signing this because blue light is not good for the eyes, and it's super blinding and damaging to the cornea. Many studies show this and I want to do my let you help spread health and wellness.

B.1361 February 28, 2020 — Versailles, KY

Blinding LED Headlights are a danger to drivers and should be banned to help save lives .

B.1362 February 28, 2020 — salvisa, United States

Signed

B.1363 February 29, 2020 — Bronx, NY

I despise those lights, they blind me

B.1364 February 29, 2020 — Carlsbad, CA

The Auto Club is wrong...drivers will never get "acclimated" to these headlights, but continue to be endangered by these blinding lights.

B.1365 February 29, 2020 — Dunkirk, NY

Let's not lose lives for annoying headlamps plz I do dislike them too.

B.1366 February 29, 2020 — Mahopac, NY

I flipped my car over 4 days ago. Actually wnet airborne 15 feet in the air and landed upside down on account of being blinded by LED lights in oncoming traffic. Luckily no one else was involved, I was able to walk away with scratches, bumps and bruises. My car a total loss. Thankfully, it did it's job an kept me cocooned in safety bags. These led lights are disgusting, and so selfish. They need to be banned!

B.1367 February 29, 2020 — St Charles, MO

These lights are dangerous!

March 2020

B.1368 March 1, 2020 — BRISTOL, ENG, United Kingdom

It so dangerous to the income driver

B.1369 March 1, 2020 — Bronx, NY

As a driver, I believe there a driving hazard. Extremely dangerous.

B.1370 March 1, 2020 — Covington, TN

They blind the heck out of you while trying to drive

B.1371 March 1, 2020 — Goonellabah, Australia

I was driving on a back road one night and was being tailed by a car with blinding lights so had to point my rear view down. Suddenly another car approached with blinding lights and I could not see the edge of the road and wound up in a ditch requiring road service, wheel rim repair and a new tyre. It could have been much worse. These lights also give me mild headache like lasers and I believe they should be banned and all production ceased with full scientific and medical investigation done.

B.1372 March 1, 2020 — Kyogle, Australia

Unnecessary bright lights are dangerous!

B.1373 March 1, 2020 — Lismore, Australia

These new headlights are so dangerous. Can we have the old ones back please. They don′t help the driver and blind the people in oncoming cars.

B.1374 March 1, 2020 — Newport, MI

The lights are extremely distracting. Especially at night

B.1375 March 1, 2020 — Seattle, WA

Due to the brightness of these lights, it now takes longer for my eyes to adjust back to normal after having them blind me starting from quite a distance away. It′s not only dangerous it′s also very annoying!!

B.1376 March 1, 2020 — St Charles, MO

It′s awful. I see them and it′s a shock.

B.1377 March 2, 2020 — Detroit, MI

These lights are so blinding!! It′s going to, if it hasn′t already, cause accidents!! I get totally blinded and I′m mad about it!! How can they allow this? No different then me driving around with MY brights on!!

B.1378 March 2, 2020 — Lancaster, NY

Finally some much need attention to this.

B.1379 March 5, 2020 — Antioch, TN

I have night blindness and these make it IMPOSSIBLE to see when coming either toward or in rear view 郎

B.1380 March 6, 2020 — Charleston, Canada

This is definitely an issue for anybody. These LED headlights blind everyone and they aren′t any more effective than the old fashion headlights but instead all they are good for is blinding other drivers. Banning these headlights should′ve been done long ago

B.1381 March 6, 2020 — Sacramento, CA

I think all these new supersonic headlights whether factory OEM on new cars and trucks or aftermarket bought from the auto parts store, are extremely annoying and down right dangerous, I get almost completely blinded by mostly every other car or truck coming at me with those LED or projector style LED′s, takes awhlie for my eyes to recover, these new headlamps can′t be any good for anyone′s eye sight as well, it′s just ridiculous!

B.1382 March 7, 2020 — Altoona, United States

I can′t see the road or or a person should one come in front of me if a car with these lights are coming at me.

B.1383 March 7, 2020 — San Pablo City, Philippines

Blinding headlights are dangerous.

B.1384 March 7, 2020 — United States

The headlights are dangerous and extremely irresponsible!

B.1385 March 7, 2020 — gateshead, ENG, United Kingdom

these lights are to bright

B.1386 March 8, 2020 — Pratt, United States

My wife had lasik eye surgery and has issues with bright lights star bursting. These insanely bright lights virtually blind her when cars are coming towards her or behind her. I also have mild light sensitivity and these lights blind me as well so I can only imagine. These lights create dangerous driving conditions for everyone including those who use them because they blind other drivers. Please save lives and everyone's eyes.

B.1387 March 9, 2020 — Federal Way, WA

Save lifes

B.1388 March 9, 2020 — Little Falls, NJ

Anthony Cunningham Sayreville,New Jersey

B.1389 March 10, 2020 — Kennewick, WA

this is good, unironically

B.1390 March 11, 2020 — Columbus, OH

Cindi Fox

B.1391 March 11, 2020 — Port Orchard, WA

These lights hurt your eyes.

B.1392 March 12, 2020 — Birmingham, AL

They ARE dangerous! I am literally driving blind when a car with HID or LED is in front or behind me. I have a panic attack every time I have to drive in the dark because I can't see where I'm going. Praying that I don't run off the road and kill myself or someone else. We've gotten by just fine with normal headlights!!! Not everyone can afford the headlights or a new fancy car with them already installed. So the driver with death ray headlights can see 5 miles up the road but I can't see a single thing, that just doesnt make sense. People in my hometown used to get tickets if they had the blue halogen lights, but now it's a norm. It's not a "safety feature" it's a freaking safety hazard because one person is putting multiple people in danger and it's getting rediculous. When you drive at night your pupils naturally dilate. And then when you pass a blinding light that looks bright as the sun, it's painful! And then your pupils naturally try to contract and then you can't see whats in the dark anymore. It's simple science and we shouldn't have to fight this that hard!

B.1393 March 12, 2020 — Palm Springs, CA

I have been at the brink of fatal accidents because of blinding headlights it should be prohibited !!!!

B.1394 March 12, 2020 — Trenton, MI

FIX FOR BLINDING LIGHTS HERE!!! PAY THE JERKS BACK! MAKE THEM SEE HOW YOU FEEL!!! I HAVE HAD IT BEING BLINDED. I bought a 14x14 mirror with a handle and a hole at the end, I first stabilized the mirror on the flat part behind the back seat with some masking tape, it holds but doesn't mess with that area , i threaded the string thru the hole of the mirror handle, then at the top of the back window i taped down a small U shaped piece of plastic to thread the string thru, then i looped the string thru the passenger above window handle, then thru my handle above my door, the string hangs down for me to reach, when a BLINDING vehicle gets behind me, i pull that string, the mirror goes up, and WAAAALLLAAAA that driver is blinded by his OWN LIGHTS. They immediately go around me having no idea what hit them!!!! So, this fixes the rear. For the front i have a boat searchlight, i am careful to only blind someone at stoplights who are blinding me on the other side. I can use this on rear drivers as well, but the mirror is perfect for that. I will continue to terrorize them like they have me until the LAW does something about this ALLOWED dangerous practice. I don't even wear glasses and i REFUSE to buy night glasses because of these A*******. Besides, they don't work very well. Car Jockey's installing these saying pointing these lights down makes a difference, that is BS, it only makes a bit of difference, these car jocks just want to keep getting paid to change lights. A LOT of pickup drivers buy these lights with brand new vehicles. So,

fight fire with fire. Give them a dose of there own meds. For they don't care there blinding us at ALL! We have been fighting this for years, and lawmakers still DO NOTHING. Driving is no longer pleasant, they have laws against TEXTING, but none on this! Just as dangerous! Why???

B.1395 March 12, 2020 — Trenton, MI

Read my response just above you, i have a fix for these rude idiots. It really works, at least for the ones behind you. These Bad LED lights are not factory installed, people buy brand new trucks and change the lights right after. After begging lawmakers, i have taken this into my own hands. More people need to, then the blinding light drivers will start complaining, it will be hilarious. Paybacks.

B.1396 March 13, 2020 — Arbor Vitae, WI

I drive a medical transport at night. Constantly blinded from oem and aftermarket led lights.

B.1397 March 13, 2020 — Memphis, TN

America is a country with no discipline.

B.1398 March 13, 2020 — Peterborough, ENG, United Kingdom

These LED headlights are a real nuisance and causing problems to eyes, they are blinding and even worse in suv's and 4x4's as they are higher up.. Nothing worse than a suv or 4x4 sitting close behind while driving and putting lots of pressure on as they blind you, it's even come to the stage where I've got out my car had a few words..

B.1399 March 15, 2020 — Cataula, GA

I agree with this 100%.

B.1400 March 29, 2020 — LONDON, ENG, United Kingdom

I have photophobia (which is quite common), and the blinding bright white headlights is very dangerous. It's not just the brightness, it's the colour temperature of the whiteness. Headlights are usually more a yellow tint, but these super white ones are dazzling and I've nearly crashed several times after being blinded by them.

B.1401 March 30, 2020 — Westland, PA

Why is it acceptable for people to be color blind but not acceptable to be blinded by brighter lights? Very Simple Request " TAKE A POLL" The poll I am getting is at least 40 % of the drivers don't like seeing these new headlight coming at them. Then why are GM Truck running light even brighter then the regular headlights? Why are jeeps interchangeable headlight low beam seam like they are full time high beams? Would it Kill our auto makers to TAKE A POLL to help protect the on coming drivers?

April 2020

B.1402 April 5, 2020 — Wootton, ENG, United Kingdom

I hate these lights, they don't need t o be so bright.

B.1403 April 7, 2020 — Portsmouth, United States

I am having to stop driving at night because the car lights actually HURT my eyes...PAIN...in my eyes.

B.1404 April 11, 2020 — Odessa, TX

I come very close to head on collision several times, I work driving a fuel transport in West Texas oilfields, on 2 lane no shoulder roads these way too bright lights people are changing to are extreamly deadly... I've been blinded (temp) and regained sight to find I've drifted over the center line... traffic is horrible out here and you get a line of cars bumper to bumper alot in the mornings and it can be deadly out here... please ban these headlights and save lives!

B.1405 April 12, 2020 — Puducherry, India

I'm a young driver who would like to live for a longer time and fight climate change and not die in a road accident before that.

B.1406 April 29, 2020 — Wickliffe, OH

Led street lights #1 . No diffusers , the brightest blue light they can find . Just wrong . Also the flashing lights off emergency vehicles, once again, the rawest unfiltered brightest beam of light being shined directly into motorists eyes. Did engineers even go to college ?

B.1407 April 30, 2020 — Garden Grove, CA

It's damaging to your eyes and dangerous while you can't see crossing pedestrian and other traffic.

May 2020

B.1408 May 6, 2020 — Conroe, TX

I can no longer drive at night due to people using these lights.

B.1409 May 7, 2020 — Mountain View, United States

These lights are dangerous and unhealthy!

B.1410 May 8, 2020 — Canberra, Australia

LED are excessive

B.1411 May 9, 2020 — Dallas, TX

We need laws in America badly to fight the people that are intentionally playing games with their headlights. I've been a truck driver for better than twenty years and many people know what they are doing I have to use a laser pen to force people to turn their damn headlights down and in some cases they refuse or simply can't because they have intentionally aimed their headlights too high. We Truckers are sick of it!!! The government allowed all this madness to happen they can fix what they broke.

B.1412 May 12, 2020 — Portage, United States

Surprised there are not more people who would like to address this issue. Thank you for starting this petition!!

B.1413 May 15, 2020 — Hurricane, UT

These god damn trucks man, it's 8 in the morning and you are literally choosing to keep your lights on. you're distracting and blinding oncoming traffic. ASSHOLES.

B.1414 May 15, 2020 — United Kingdom

It is a fact that it disturbs my vision whenever am driving pass a car, van whatever it may that uses LED lights. It's two BRIGHT

B.1415 May 16, 2020 — Cypress, TX

Ban bright headlights or allow tinted windsheilds

B.1416 May 20, 2020 — Sweet Home, OR

Please feel FREE

B.1417 May 20, 2020 — Sweet Home, OR

Feel FREE to SHARE with your Peeps!!!

B.1418 May 20, 2020 — Sweet Home, OR

I Agree! And what happened to the studies they we're supposed to be performing at two different colleges in the Midwest? Each article I have read states that these new Blinding White Bright lights are not good for our eyes yet we can't seem to get them off the road.

B.1419 May 20, 2020 — Sweet Home, OR

AMEN !

B.1420 May 20, 2020 — Sweet Home, OR

I See This Too!

B.1421 May 20, 2020 — Sweet Home, OR
Yes!

B.1422 May 24, 2020 — Australia
Information from Australia https://samotor.raa.com.au/the-dangers-of-modern-headlights/

B.1423 May 24, 2020 — Canberra, Australia
Its time we put our bodies health first above any new technology

B.1424 May 25, 2020 — Australia
I hate being blinded by headlights on cars & bikes. Its dangerous!

B.1425 May 25, 2020 — Chicago, IL
We don't need extremely bright headlights. Yes, we need headlights in order to drive a car, but they can't be too bright.

B.1426 May 30, 2020 — Commerce, GA
Need to ban them

B.1427 May 30, 2020 — St Augustine, FL
Lane Miller

B.1428 May 30, 2020 — Summerdale, AL
I believe these lights cause more wreckage and night blindness when I encounter these on the road I usually have to come to an almost stop when they pass me.

B.1429 May 31, 2020 — Hawthorne, NJ
This is very dangerous! Please fix this issue before more lives are taken for such a small problem

B.1430 May 31, 2020 — United States
Because I cant see when people use those bright blinding lights

June 2020

B.1431 June 21, 2020 — United Kingdom
save lives all lives matter

B.1432 June 22, 2020 — Battle Ground, WA
I am BLINDED by headlights when I drive at night. Those coming towards me, and those behind me. The LED lights that are a blue hue should be illegal. The yellow hue is much easier on the eyes. I don't often drive at night because of the extreme glare from headlights, especially those on new cars.

July 2020

B.1433 July 1, 2020 — Epsom, ENG, United Kingdom
These lights increase the risks associated with driving and cause RTCs.

B.1434 July 6, 2020 — Hamilton, New Zealand
I have to pull down a very dark filter to nearly completely block my view of the oncoming side of the road.

B.1435 July 10, 2020 — Derby, ENG, United Kingdom
I find myself often having to stop in the road because I cannot see where I'm going due to stupidly bright lights equipped on oncoming traffic. The simple view of regulating lighting by their wattage is no long accurate, those standard were set when filament bulbs were the normal. Compare the lumen output from a 35w filament bulb compared to a 35w LED. Also newer lighting has much much blue light spectrum which scatters and is harmful to health. I believe the colour temperature should also be controlled and limited to no more than 4700k

B.1436 July 29, 2020 — Florence, KY

I work third shift and I HATE these lights!!!! They give me Migraines.

B.1437 July 30, 2020 — Australia

Sick of being blinded at night and am concerned about safety on the road

August 2020

B.1438 August 18, 2020 — ocala, FL

I've been ran off roads numerals times from these bright lights. They prevent a normal ability to drive at night. But they include unshielded streetlights shining for blocks away into private residences. And.... spotlights on houses pointing up & off owners property. In turn, this prevents residents from being able to walk for exercise! Bright lights disrupt circadian rhythms of all living beings, even plants. It appears most citizens don't care or perhaps just ignorant to the damage in process to this planet. Not to mention taking away our right to see the beautiful night sky. It's no wonder so many children have no knowledge of science since the simple joy of viewing the Cosmos thru a telescope is non-existent in many cities & towns. We used to be able to drive to the countryside to see the night sky but with so many home owners duped into believing these bright LEDs are healthy, many have these lights with no shields or covers, sending billions of $$ wasted energy into the sky per NASA.

B.1439 August 21, 2020 — Australia

I dislike large 4WDs behind me blazing these ridiculous lights in my mirrors. They don't focus well on the road, but rather spread light in all directions.

B.1440 August 21, 2020 — Buddina, Australia

I find driving st night challenging when oncoming vehicles have high intense white LED lights

B.1441 August 22, 2020 — MN, United States

I have had to pull off the road when these are behind me - blinding and dangerous!

B.1442 August 22, 2020 — Murfreesboro, TN

These lights are blinding! I already have trouble seeing at night and these make it worse. It's gotten to the point that if I don't know exactly where I'm going, I can drive at night because of these lights! And I'm only 50!!!

B.1443 August 26, 2020 — La Porte, TX

Excessively bright headlights have repeatedly made it to where I couldn't properly see while driving at night, causing me to nearly run a stop sign one time and nearly hit a pole on another. Ban these pointless safety hazards! No one needs them!

B.1444 August 27, 2020 — United States

I have almost ran off the road several times due to idiots failing to dim these lights. I hate meeting a car using HID. I took the HID headlights out of my housing as a courtesy to other road patrons.

B.1445 August 29, 2020 — Hayward, CA

BLINDING LIGHT HURTS MY EYES!!!!

September 2020

B.1446 September 3, 2020 — GAINESVILLE, FL

Those lights are blinding and have no place on public roads. Strictly off-road only!

B.1447 September 3, 2020 — Pensacola, FL

Don't forget the damn smart phones and such. -signed, a sportbike rider.

B.1448 September 7, 2020 — Bath, NY

Those lights are blinding , in back of you, or coming at you. Dangerous !

B.1449 September 7, 2020 — Rolla, MO

I've almost been run off the road when cars with these bright blue lights come from the other direction. The glare seems to negate any potential safety benefit to the driver of the car with the offending lights. We have high beams that can be toggled on/off for a reason! The blue also scatters more, causing light pollution and potentially making it harder to see in fog or snow.

B.1450 September 12, 2020 — Lockport, United States

I feel extremely unsafe driving with LED lights flashing in my direction. It makes it incredibly difficult and painful to drive with those lights directly in my eyes

B.1451 September 16, 2020 — Arlington, TX

I have severe light blindness

B.1452 September 18, 2020 — Keansburg, NJ

I've been blinded 1 to many times.

B.1453 September 21, 2020 — Auburn, AL

Your improved vision is not justified at the expense of others on the road. Use normal headlights or don't drive.

B.1454 September 28, 2020 — Bronx, NY

They are too bright and blinding. When they reflect on rear view and side mirrors they are also a nuisance.

October 2020

B.1455 October 2, 2020 — Halifax, Canada

2018+ Toyota Corollas are still the worst here in Canada. All new higher trucks, and even Acura SUVs with their new LED units too. What I won't stand for are the new Jeeps with their LED lights in the driving lights and fog lights. It's the most a-hole selfish thing I've seen. Worst than older civics with ebay bulbs.

B.1456 October 2, 2020 — Pompton Lakes, NJ

Because they are dangerous.

B.1457 October 7, 2020 — Brooklyn, NY

This extreme intensity of brightness can't possibly be necessary for the vast majority of driving situations. But this intensity and glare is dangerously blinding for oncoming drivers. Combine this with the huge popularity of SUVs and crossovers and these extremely bright lights seem to hit directly on eye level for drivers who are in passenger vehicles that sit lower to the ground. If the new, blinding lights are intended to be trained at the roadway, that's not what's happening. It's very stressful - even for a very experienced driver in a familiar area - to simultaneously avoid the oncoming car, parked cars along the road - and, especially pedestrians and cyclists. This seems to be part of a virtual arms race - much louder horns, much brighter lights. And the drivers behind these lights don't seem to realize the danger they are causing - including to the themselves. I don't know what else to do other than slow down - and flash my brights briefly at a distance to try and let the oncoming driver know their lights are too bright. I cannot fathom how blinding oncoming drivers can be allowed given the comparatively limited benefits to those with the brighter headlights. We want to encourage healthy public activity like running and walking and cycling. But I have found pedestrians and cyclists on my side of the road extremely hard to see when blasted with oncoming headlights trained at eye level.

B.1458 October 8, 2020 — Troy, MT

Because when confronted with these lights, I am temporarily blinded. Not safe.

B.1459 October 12, 2020 — La Puente, CA

I hate not being able to see well when driving and these lights make night driving terrible especially when it's a new suv or truck that accidentally turned on their high beams on top of their annoying led lights

B.1460 October 14, 2020 — Harrison, OH

the lights today are sooo bright they hurt my eyes and often trigger headaches and migraines

B.1461 October 14, 2020 — Jacksonville, NC

I'm signing because on a daily basis, I am unable to use my side view mirror to check lanes when driving to work due to these lights. When the interior of your car looks brighter than noontime sunlight at 5:30 in the morning, it's dangerous.

B.1462 October 15, 2020 — Gilmer, TX

LED headlights are blinding! Let's get rid of a totally needless danger on our roads.

B.1463 October 16, 2020 — San Antonio, TX

Super bright headlights are dangerous. There's no need for headlights that bright in a city or around other drivers. We have separate brights for a reason. Install them as your brights so you can have a lot of light when it's actually necessary without blinding other drivers.

B.1464 October 17, 2020 — Mission, TX

Those lights get me dizzy and I was close to crashing and fainting

B.1465 October 21, 2020 — Boise, United States

Bright LED lights are dangerous.

B.1466 October 22, 2020 — Jacksonville, FL

- YESTERDAY- THIS HAPPENED TO ME BECAUSE I COULD NOT SEE - Driving to a new workplace before daylight in a drizzling rain, no street lights, no visible road markings, tons of glare from oncoming hyper-headlights multiplied by the reflections on wet pavement made my visual acuity so poor that I turned into the near lanes of a divided highway... had to drive a half mile against traffic (thankfully sparse) before I found a paved crossover. This is not my first incident with hyper-bright LED blindness, just the latest. Even under ideal conditions I often can't see turn signals next to the hyper-headlights. I don't dare flash high-beams at a hyper-brights coming at me for fear that might be their low-beams blinding me.

B.1467 October 24, 2020 — Placerville, CA

I find it scary driving at night when I'm constantly being blinded by headlights that are way more bright than they ever needed to be

B.1468 October 27, 2020 — Crystal Lake, IL

I wasn't aware of this blaring problem until my shift changed and I leave my house by 4:30AM. Now that I drive through the dark every morning I am regularly blinded by cars. This is especially bad on curvy and hilly side roads. I thought some people were just driving with their brights on so I flased mine at them only to be assailed with their brights. It is so bad that I have to keep my sunglasses ready so I can put them on then take them off again so I can see without getting blinded. These do it yourself LED upgrade kits should be illegal, especially since they often beam straight ahead instead of aiming downward towards the road ahead of the vehicle. Trucks are especially egregious in this regard.

B.1469 October 29, 2020 — Bradford, ENG, United Kingdom

Super super dangerous

B.1470 October 29, 2020 — United States

These are so bad for our vision & they are blinding at times, esp for those with less than perfect vision. Some do it just to annoy people (turn them on before its dark) while other cars turn them on

automatically. Im sure they cause accidents, its like the blaring sun & at the LEAST are a huge safety hazard. Weve all had the regular lights, should stay that way

B.1471 October 29, 2020 — Wabamun, Canada

SHOULD BE ILLEGAL ABSOLUTELY BLINDING

B.1472 October 30, 2020 — Clermont, FL

As a professional class a cdl driver with over 30 years experience I'm surprised these blinding headlights are legal i am blinded consistantly at night to the point of almost crashing on certain sections of interstate and highway. Also so bright my eyes take time too recover these lights are gonna cause fatal accidents guaranteed

November 2020

B.1473 November 10, 2020 — Oklahoma City, OK

I'm signing because I'm tired of being dangerously blinded while driving. I'm for safety but safety for ALL drivers not just THE driver.

B.1474 November 11, 2020 — Leedstown, ENG, United Kingdom

These style lamps are far to bright and cause momentary night blindness. They are just dangerous to oncoming traffic. Plus they are bright enough to blind you to obstacles such as narrowing verges and pedestrians on country roads at night.

B.1475 November 14, 2020 — Everett, WA

These LED headlights are completely blinding and dangerous on the road!

B.1476 November 14, 2020 — Lynnwood, WA

These lights are a hazard. Causing temporary blindness of other drivers and countless other problems that a light that bright presents

B.1477 November 19, 2020 — Doagh, NIR, United Kingdom

Dangerous in the extreme!!!

B.1478 November 20, 2020 — Manalapan, NJ

These lights are too bright and blind on coming driver's

B.1479 November 20, 2020 — Monroe Township, NJ

They are so blinding in front of you and behind you . It's equal to hanging your brights on. What's the difference ? None !

B.1480 November 20, 2020 — Philadelphia, PA

I feel it affects all and it can cause accident

B.1481 November 21, 2020 — Peterborough, ENG, United Kingdom

These are going to cause a while bunch of accidents. But then why should I bother signing, it's just another tally for the government to add to population control.

B.1482 November 23, 2020 — Durham, NC

My mother was killed by flash blindness while driving.

B.1483 November 23, 2020 — Hastings, MN

LED lights are DANGEROUS! I've lost count of the number of times I've been totally and completely blinded by them and couldn't see where I was going but had to keep moving forward at the speed limit anyway because slowing down would have caused me to be rear ended.

B.1484 November 24, 2020 — Pittsburgh, PA

These lights are dangerous!

B.1485 November 25, 2020 — Hialeah, FL
That shits too bright

B.1486 November 27, 2020 — Los Angeles, CA
I agree that headlights have definitely gotten to an unsafe level of brightness over the years. More is not better when it comes to proper headlights.

B.1487 November 28, 2020 — Yorktown, IN
My wife and have almost crashed multiple times cause of people with led bulbs.

B.1488 November 30, 2020 — Greeley, CO
Blinded by the light...

B.1489 November 30, 2020 — Springfield, IL
Driving at night is difficult for me as is, without that blankety, blankety headlight glare.....

B.1490 November 30, 2020 — Thatcham, ENG, United Kingdom
LED MUST be banned !!!

December 2020

B.1491 December 1, 2020 — Auburn, IN
I'm tired of being blinded by o. Coming g vehicles with bright lights.

B.1492 December 1, 2020 — Rogers, AR
These lights are only beneficial to the person/person's driving the car in which they are installed but putting other drivers in harm's way

B.1493 December 1, 2020 — Tyler, United States
This shit gives me headaches and as the bright lights get closer, my eyes can barely see the lines and what is ahead of me. And I have perfect eyesight, imagine what it's like for someone with out perfect eyesight to see, other than blinding ass headlights, that of which are sometimes worse that other vehicles bright headlights.

B.1494 December 2, 2020 — Targoviste, Romania
Return to normality! The bad light kills!

B.1495 December 2, 2020 — Washington, DC
I'm signing because I care about the well-being of the people.

B.1496 December 3, 2020 — Constanta, Romania
I hope...

B.1497 December 3, 2020 — Eatontown, NJ
Can't see cause this shit

B.1498 December 3, 2020 — Endicott, NY
I hate the blinding LED headlights! It is dangerous for other drivers who don't have them and annoying to be blinded by assholes who want to be boss of the road!

B.1499 December 3, 2020 — Hope Mills, NC
I can't believe these things are allowed on the road. I can't see anything for several seconds when they pass and it's on many cars here.

B.1500 December 4, 2020 — New Brunswick, NJ
I have difficulty seeing at night and these just make it worse.

B.1501 December 5, 2020 — Arlington, VA
These lights blind drivers at night for several seconds and accidents are going to happen.

B.1502 December 5, 2020 — Dawson, GA
Tired of not being able to see when the LED headlights pass. They are gonna cause deaths.

B.1503 December 7, 2020 — Rochester, NY
I fucking hate led lights

B.1504 December 8, 2020 — New York, NY
Led lights are annoying

B.1505 December 8, 2020 — bedford, VA
These new lights are DANGEROUS!!!! IVE ALMOST BEEN IN A FEW ACCIDENTS BECAUSE I COULDN'T SEE!!!!

B.1506 December 8, 2020 — bedford, VA
These blinding lights need to be illegal!!!

B.1507 December 9, 2020 — Charlotte, NC
Night vision is hard enough for some but add these lights to the mix and they truly are dangerous!

B.1508 December 9, 2020 — United States
These lights have caused me driving issues after dark on my narrow country roads and I can't believe these headlights haven't already been outlawed. No brainer, they are hazardous!

B.1509 December 10, 2020 — Cary, IL
I want to be able to see at night when passing cars

B.1510 December 13, 2020 — Hialeah, FL
Kenneth Howison

B.1511 December 13, 2020 — San Diego, CA
It has been my experience over the last few years that it's becoming very unpleasant to drive at night. More and more cars have blinding headlights. Most annoying situation which is becoming all too common: SUV or pickup truck behind me or just on the left lane super bright lights blind me through my side mirror. In that situation I have only one option: raise my hand to block the light, which means essentially that I cannot see what's happening on the side, unless I accelerate or slow down so that they pass me. Anyway we need to ban blinding headlights. They are increasing the risk of accidents.

B.1512 December 15, 2020 — Arlington, WA
I'm afraid I will hit a walking pedestrian one day, due to not being able to see from the blinding headlights of these others drivers.

B.1513 December 15, 2020 — Wyoming, MI
I just watched a news story on how a car safety is pushing for companies to phase out halogens because LEDs are safer since you see farther; but nothing said about this issue.

B.1514 December 16, 2020 — Palm Coast, FL
The lights blind me terribly. I already have issues seeing halos around lights while driving at night and these lights are terrible.

B.1515 December 17, 2020 — Seattle, WA
Because Lights have gotten so bright and Dramatically in the past 2 years - it has to be addressed

B.1516 December 18, 2020 — Biloxi, United States
To hell with people who own these things. I vote we behead them publicly.

B.1517 December 18, 2020 — Norfolk, VA
I too have eight issues when people have auto- high beams.

B.1518 December 18, 2020 — Webster, NY

they are dangerous and annoying!

B.1519 December 19, 2020 — Saint Paul, MN

I can’t deal with being blinded day and night by these ridiculous lights. I’m glad you can see 1,000 miles ahead of you but it’s horrible for the rest of us. It’s gotten so bad that I have to move my side mirrors down because I can’t deal with the constant, painful brightness in my eyes. This needs to stop. NOW.

B.1520 December 20, 2020 — Barnhart, MO

Posted it and have talked to other people who feel like we do.

B.1521 December 20, 2020 — bucuresti, Romania

For life !

B.1522 December 27, 2020 — Silverado, CA

Anyone who suffers from even a slight stigmatism like I have had since I was 30 knows these LED are horribly dangerous. It's not just the lumens it's the blue light that is plain awful. People suggest you should just look away OMG how dumb is that!

B.1523 December 31, 2020 — Alvarado, TX

I'm so glad I found this, I've been saying how I don't understand how they are legal when they literally blind you, cause you to see spots, and distract from the road. They need to go

Comments left in 2021

January 2021

B.1524 January 2, 2021 — Truro, ENG, United Kingdom

From one who suffers migraines, these lights often bring them on, I hate them always having to shift my windscreen mirror

B.1525 January 4, 2021 — Ann Arbor, MI

These lights are incredibly blinding. I have stopped driving at night because of these horrid lights. And during the day, many are STILL blinding.

B.1526 January 4, 2021 — Howard, OH

Please ban. This type of headlights is going to cause many accidents and deaths that are unnecessary.

B.1527 January 4, 2021 — Lawrence, United States

I am deeply moved by this petition. I am not often an irate person and rarely feel that my options should be imposed to the masses but when it comes to the topic of headlight brightness I am incredibly passionate and have even considered starting petitions of my own. Thank you for creating this .... I feel very seen (but with the warm glow of a normal headlight not anything dangerously bright if you get my drift [which is what happens to my driving when I am blinded by an LED headlight])

B.1528 January 4, 2021 — Pointe au Baril, MI, Canada

I can't see when driving at night. It's more dangerous becuase of these lights.

B.1529 January 5, 2021 — Charlottesville, VA

This is a concern that doesn't only affect older drivers or people who may already be visually impaired. This is a concern for all people on the road.

B.1530 January 6, 2021 — Princeton, NJ

I am about to do further research online, but it is already obvious to me that the headlights I am exposed to as a driver and as a pedestrian, in daylight and in darkness, hurt my eyes -- in the same way that a glance into the sun hurts one's eyes. And everyone to whom I have mentioned this problem

has agreed that it hurts their eyes, too. Someone has to take action immediately, as the damaging lights are becoming more and more prevalent on the road, and it looks as if the NHTSA is the agency to whom the task of saving our eyesight must fall. It is interesting to hear that the excessively bright and blue headlights might be shown to be causing an increase in motor vehicle accidents -- I find that highly plausible, based on the lengths to which I have to go in order to protect my eyes while driving. And I am glad to hear that the American Medical Association has already taken a stance requesting that these damaging lights be banned. I also want to point out that the great benefit touted for LED lights -- reduction in electric power consumption -- does not apply in the case of a fossil-fuel-driven vehicle in which a standard alternator is used to generate 12-volt power; this technology, driving the lights and the entire onboard electrical system off the vehicle's engine as a byproduct of the fuel combustion, generates more power than is needed to light even the older-generation incandescent headlights, so no power saving is achieved by the switch to LED lights, except in the case of all-electric vehicles. This is another simple case of unintended consequences that arise when new technologies are adopted without sufficient prior testing for long-term harm. Please take action immediately! There is also an epidemic of macular degeneration leading to blindness in older folks, and it appears to be linked to the wholesale switch to LED lighting, both in vehicles and in our homes and workplaces.

B.1531 January 6, 2021 — Wabamun, Canada

The LED lights are so blinding that I put my visor down and this compromises how much I can see in front of me. I get headaches from too much exposure to these lights. Building and street lights are also ridiculously bright.

B.1532 January 7, 2021 — Halifax, Canada

We are past the ebay H1 in a civic days! It's 2021 and the latest and greatest culprits are: Any 2020+ Jeep with LEDs 2017-2018 Toyota Corolla 2019 Ford Explorer 2015+ Escalade 2019/2020 Subaru Forester 2019+ Honda Civic Also not all roads are level and here in Canada (ie - twinned highways) and we don't have self adjusting headlights. Recall all vehicles that have these lights!

B.1533 January 7, 2021 — Stonehaven, SCT, United Kingdom

i'm signing because i'm one of the many who struggle with exactly this problem.

B.1534 January 8, 2021 — Fayetteville, AR

These lights blind me because I can’t look at then head on. I have to look or wear sunglasses. These are dangerous and cause so much time and distraction from driving.

B.1535 January 14, 2021 — Le Roy, NY

I shouldn't need special shaded glasses to drive at night

B.1536 January 14, 2021 — Portland, OR

Overly bright, blue-rich white lights are unnecessary, waste energy, and are harmful to all forms of life.

B.1537 January 15, 2021 — Garland County, AR

These lights are annoying, far too bright and blinding.

B.1538 January 16, 2021 — Colorado springs, CO

I get blinded all the time when I'm driving and people don't seem to care.

B.1539 January 16, 2021 — Lansing, MI

I believe in safe driving and blinding lights are not safe

B.1540 January 18, 2021 — Chicago, IL

Because I'm tired of not being able to see when I'm driving. I'm doing this because driving at night I am blinded by the bright lights. I'm signing this also because I have a new teenager who will be driving who is already complaining while sitting in the passenger seat that they can't see past the cars coming in are concerned for my safety and theirs

B.1541 January 18, 2021 — Coal City, IL

I agree with this, but I am unsure what can be done to fix the problem. A large percentage of newly manufactured vehicles are produced with these lights. There are so many on the road today that were manufactured like that legally. What do you do about them?

B.1542 January 19, 2021 — Bilston, ENG, United Kingdom

I believe that some lights are far too bright and actual increase the risk of accidents happening

B.1543 January 19, 2021 — Newark, DE

I am a shift worker that has to drive at night. I regularly fear that I am going to get in an accident. These lights are dangerous and unnecessary.

B.1544 January 20, 2021 — Nashville, TN

I can't see

B.1545 January 21, 2021 — Warden, WA

At least start with trucks. They are in direct line of sight with opposing traffice

B.1546 January 22, 2021 — Pittsburgh, PA

I have only been driving for 6 years now, and HID/LED headlights have made those years miserable as soon as the sun goes down. I can barely see at night thanks to everyone driving their own miniature suns around and searing my eyes.

B.1547 January 23, 2021 — Crestwood, KY

horribly bright and blinding, so bad that in bad weather it makes it impossible to see

B.1548 January 25, 2021 — Plymouth, WI

I hate getting blinded by poorly aimed low beam lasers.

B.1549 January 26, 2021 — Shawnee, KS

Make the emphasis on the spectrum of light. That is what matters the most. Get rid of the blue lights,

B.1550 January 27, 2021 — Nashville, TN

It's time the DOT and Congress intervene as they did in the late 80s or 90s regarding headlight brightness. About 6yrs ago, I asked a young Nissan engineer Why the new bright blinding headlights; his reply with a smirk, "If we can save a buck...." These daylight headlights are extremely Dangerous. I, as do other friends, now wear sunglasses when driving at night in the city or on interstates. I also now always have the rear view mirror in "reflective" position, though that does NOT help if a truck or SUV is behind nor does it block blinding light in side view mirrors. With our US population getting older, blinding older drivers is hazardous to them and other drivers, as is the case for inexperienced young drivers. I'm also told by friends that replacing these horrible headlamps is incredibly expensive on certain high-end cars. Congress needs to ask. I'll be writing Pete Buttigieg and President Biden.

B.1551 January 29, 2021 — Cleveland, OH

I've experienced this blinding phenomenon and I think it's important for standards to be set regarding hue and brightness in the interest of safety.

B.1552 January 30, 2021 — Morgan Hill, CA

I'm a Truck Driver. I sometimes have a car beside me that I can't see because all I see is the LED lights on the car behind him. With LEDs coming twards me on a busy two-lane, I may not see the tail lights of the car in front of me.

B.1553 January 30, 2021 — Plainville, IN

I own a small trucking company and drive after dark. These headlights are dangerous to drivers. Cause blindness

B.1554 January 30, 2021 — San Bruno, CA
It's very frightening, and very dangerous not being able to see on the road. Also, those bright lights can cause headaches constantly in the rearview and sideview mirrors.

B.1555 January 30, 2021 — San Bruno, CA
It's frightening, and dangerous not being able to see while driving. I've also experienced the headache inducing effect with these lights constantly in my rearview and side mirrors.

B.1556 January 30, 2021 — San Bruno, CA
It's frightening, and dangerous not being able to see while driving. I've also experienced the headache inducing effect with these lights constantly in my rearview and side mirrors.

B.1557 January 30, 2021 — San Bruno, CA
It's frightening, and dangerous not being able to see while driving. I've also experienced the headache inducing effect with these lights constantly in my rearview and side mirrors.

B.1558 January 30, 2021 — San Bruno, CA
It's frightening, and dangerous not being able to see while driving. I've also experienced the headache inducing effect with these lights constantly in my rearview and side mirrors.

B.1559 January 30, 2021 — San Bruno, CA
It's frightening, and dangerous not being able to see while driving. I've also experienced the headache inducing effect with these lights constantly in my rearview and side mirrors.

B.1560 January 30, 2021 — San Bruno, CA
It's frightening, and dangerous not being able to see while driving. I've also experienced the headache inducing effect with these lights constantly in my rearview and side mirrors.

B.1561 January 30, 2021 — San Bruno, CA
It's frightening, and dangerous not being able to see while driving. I've also experienced the headache inducing effect with these lights constantly in my rearview and side mirrors.

B.1562 January 30, 2021 — San Bruno, CA
It's frightening, and dangerous not being able to see while driving. I've also experienced the headache inducing effect with these lights constantly in my rearview and side mirrors.

B.1563 January 30, 2021 — San Bruno, CA
It's frightening, and dangerous not being able to see while driving. I've also experienced the headache inducing effect with these lights constantly in my rearview and side mirrors.

B.1564 January 30, 2021 — San Bruno, CA
It's frightening, and dangerous not being able to see while driving. I've also experienced the headache inducing effect with these lights constantly in my rearview and side mirrors.

B.1565 January 30, 2021 — Sicklerville, NJ
Mark DeBiase

B.1566 January 31, 2021 — Wahoo, NE
They’re ridiculous, and flat out rude.

February 2021

B.1567 February 7, 2021 — San Diego, CA
Lights should adjust when cars are in lighting levels areas.

B.1568 February 9, 2021 — Waterloo, United States
I can’t see when driving

B.1569 February 10, 2021 — West Springfield, MA

It's getting to the point where I need to pull over until it's safe to continue driving. I also have a lot of trouble focusing and seeing on the road when they are behind me, forcing me to adjust my mirrors which is almost as dangerous as not doing so. Please make these headlights illegal for the safety of the people.

B.1570 February 13, 2021 — Australia

Ironically an avoidable dangerous hazard.

B.1571 February 14, 2021 — Erlanger, KY

I now have LED headlights, they are too bright. I have trouble seeing the road in the distance, it's like there is a line...because they have to aim down.

B.1572 February 14, 2021 — Saratoga Springs, UT

I'm tired of being blinded and fearful of getting in an accident because of headlights being so bright.

B.1573 February 14, 2021 — st andrews, SCT, United Kingdom

LED makesroads more dangerous and retinas less responsive

B.1574 February 15, 2021 — Charlotte, NC

Can't see at night with those bright headlights.

B.1575 February 15, 2021 — Hendersonville, NC

These lights are blinding and dangerous. I need to be on the road at night for work so I have no choice but to put up with them. I should not have to take my life into my hands every time I go to work because oncoming headlights are blinding me.

B.1576 February 15, 2021 — Kitchener, Canada

On far too many occasions I have been blinded by these lights. They are too dangerous!!!

B.1577 February 15, 2021 — Summerville, SC

I agree. No rules and now became a competition who has the brighter.

B.1578 February 15, 2021 — United States

They are making the road dangerous! I have had a lot of problems seeing the road due to these lights!

B.1579 February 15, 2021 — crosby, TX

I'm a truck driver and these headlights are too blinding.

B.1580 February 16, 2021 — Cincinnati, OH

These new lights are horrible at night and actually hurt my eyes.

B.1581 February 16, 2021 — Croswell, MI

These are terrible. It makes it so hard for me to drive.

B.1582 February 16, 2021 — Mt Vernon, OH

My husband is an over the road driver. He has been off work because the lights blind him at night and he is afraid of having an accident.

B.1583 February 16, 2021 — Summerville, SC

I'm signing because way too many times I have had to slow down and almost stop in the road because the lights coming up behind me or in front of me and blinding me and I can't see the road.

B.1584 February 17, 2021 — Flagstaff, AZ

I also find it dangerous because the blinding light blocks out other light coming from my rear view mirrors, making it impossible to clearly see other cars. This makes it very dangerous when changing lanes, or turning. It also takes my attention away as the brightness is painful and distracting.

B.1585 February 21, 2021 — Calgary, Canada

Cant see a damn wink when someone with led headlights passes by

B.1586 February 22, 2021 — Lehi, UT

So many times I′ve been blinded on the freeway and had to hold my hand up to cover my side mirror to see. Also, I feel like some cars always have their brights on.

March 2021

B.1587 March 3, 2021 — NC, United States

These lights are blinding to oncoming traffic putting many people at risk of an early death. BAN THEM NOW!!!!

B.1588 March 4, 2021 — Nashville, TN

I′ve not had an accident Yet, though have had Many close calls due to being blinded by another vehicle′s headlights. Turning onto roads where a daylight car/s is coming is particularly dangerous as one is blinded when turning and as noted many times here by others, it takes a minute or two see clearly again. Even when sitting a light or stop, an SUV or truck with them blinds me from the Sideview mirrors, so I now wear sunglasses as night when driving. And ALWAYS drive with the review mirror in reflection position. I spoke with a couple of 18 wheeler truckers who won′t put them on their trucks because they find them dangerous too, and they even get blinded by their fellow truckers. For the last 2yrs I′ve thought about writing AAA and the FHA to see what their accident stats are involving daylight headlights. And lastly, talking with a young Nissan engineer about 5yrs ago, he said regarding Why the change to daylight headlights, ″If we can save a buck, we will.″ Manufacturers definitely need regulating and the illumination set to night light amber. Same with all exterior lighting from buildings.

B.1589 March 4, 2021 — hudsonville, MI

I got into five accidents because of so much LED lights

B.1590 March 10, 2021 — Eugene, OR

My tail lights are someof these, and I have been looking at smoking them with a film.

B.1591 March 11, 2021 — Georgetown, United States

I’ve been ran off the road with these extra bright headlights.

B.1592 March 15, 2021 — Canton, OH

I usually let them pass and get. Behind them turn .y brights see how they like it

B.1593 March 15, 2021 — Stamford, NY

These lawless blinding lights have been getting worse by the week since around 2011 AND we have still yet to slow down the corrupt and greedy automobile industry from making these standard on most ALL new automobiles. You will never see me bow t acceptance of this safety hazard nor ever support the auto industry/dealers ever again!!! Stop this madness already.....ugh.

B.1594 March 17, 2021 — Portland, OR

Because these headlights are a dangerous threat to night time traffic safety, destroy night vision, and cause eye damage

B.1595 March 22, 2021 — Asbury Park, NJ

The new suoer vright headlights cause temporary blindness much in the sane manner thet oldvcanera flash bulbs did. Nultiply this times 2, and veing obe’s eyes are adjusted to nightine dark, the new super bright lights cause temporary blindness, nuch lije going into a movue thestger on a sunny day. Drivers in oncoming traffic becone temporarilary blinded.A SERIOUS PROBLEM.

B.1596 March 22, 2021 — Lincoln, NE

I get blinded by headlights on those big-ass ″petro-masculinity″ trucks all the time. Getting really sick of it.

B.1597 March 24, 2021 — LONDON, ENG, United Kingdom

these headlights could cause a serious accident , should be banned

April 2021

B.1598 April 8, 2021 — Gibsonville, NC

I'm tired of being blinded at night, losing my night vision for several minutes each time. That's a lot of time to not see wildlife.

B.1599 April 9, 2021 — Crawfordville, FL

I've almost wrecked a few times and I've had to come to a complete stop a couple of times. I cannot believe that these are even legal. I'm all for LEDs but some of these are way too bright. And Installed wrong. I am so grateful I came across this petition. Thank you guys for all your support please keep sharing.

B.1600 April 9, 2021 — Crawfordville, FL

The people should have them right!

B.1601 April 10, 2021 — Warner Robins, GA

I hate those lights! Even when not on bright they are blinding, rather in front or behind.

B.1602 April 16, 2021 — Austin, TX

Several bad experiences with this issue!

B.1603 April 18, 2021 — San Diego, CA

Absolutely! Please get rid of these bright headlights. Especially within city limits, there's just no reason why cars should have such bright lights. Also, SUVs and higher vehicles should definitely not be allowed to have bright headlights on city roads.

B.1604 April 20, 2021 — ventura, CA

Too much glare coming from the new car headlights l. It's as if drivers have their bights on 100 percent of the time. This can't be good for our eyes. Light glare is distracting!

B.1605 April 21, 2021 — Bangalore, India

I believe what Neela is fighting for is right. Bright lights do cause health problems

B.1606 April 21, 2021 — Fountain Valley, United States

UNBELIEVEABLE that these blinding lights are legal! I have to wear sunglasses when I drive at night because of these dangerous lights. Or I have to look away when I drive. Please Please Please ban these lights! I assume they cause eye damage as well!

B.1607 April 23, 2021 — Apollo Beach, FL

Mark Orlosky

May 2021

B.1608 May 1, 2021 — Bronx, NY

It's amazing how something dangling from your rear view mirror is illegal and "distracting" but these lights that cause you to not see the road are fine. People have these on during the day and they are brighter than daylight. The same people that are "pro-mask" are the same people nearly killing people with these lights.

B.1609 May 10, 2021 — Oneida, TN

They are blinding and if you cannot see good enough to have normal headlights you dont need a license.

B.1610 May 11, 2021 — Indianapolis, IN

My eyes ducking hurt

B.1611 May 11, 2021 — Lawrence, KS

I like to see

B.1612 May 16, 2021 — West Palm Beach, United States

I have nearly been run off the road by these LED headlights. They are so bright the edge of the road can no longer be seen. These are DANGEROUS.

B.1613 May 21, 2021 — Edmonton, Canada

We've had the science on this for years: white LED lights reduce visibility at night. Whether they're on cars, streetlights or buildings they are a safety and ecological hazard that need to be addressed. With great brightness comes great responsibility, something that most people have failed to show.

B.1614 May 23, 2021 — Frederick, MD

This is one rare case where government regulation can prevent an arms race between drivers.

June 2021

B.1615 June 5, 2021 — Everett, PA

Oncoming vehicles with these lights blind me. They are not safe to other drivers. When facing these light often times I have to turn my head away from the road and or hold my hand up to try and block the light. None of this is safe and could easily cause a accident. I don't state into the sun in the day time why would I want to stare at it in the night while I'm driving when it's harder for your eyes to adjust.

B.1616 June 5, 2021 — New York, NY

lights are waaayyy to bright!

B.1617 June 5, 2021 — Rochester, MN

The lights have an intense bright beam that hinders oncoming traffic from correctly viewing the road and hazards ahead of them. The intense bright headlights are a road hazard with a good potential of causing accidents

B.1618 June 5, 2021 — San Diego, CA

These too bright, badly adjusted lights are dangerous and I'm scared when I have to drive at night !!!

B.1619 June 5, 2021 — San Francisco, CA

I am rendered effectively blind for 3-5 seconds at a time by these headlights, and when driving on a two-lane highway at night, it is terrifying. It does not need to be this way.

B.1620 June 5, 2021 — vineland, NJ

i have an SUV and cannot see when these pickup ups wit these type of lights come at me! I cannot imagine being in a car with these blinding lights coming at me. We use to have laws against these types of high intensity lights on vehicles, enough already!

B.1621 June 6, 2021 — Albuquerque, NM

The glare from headlights at night is extremely painful, and I have no choice but to drive at night. It's ridiculous.

B.1622 June 6, 2021 — Burlington, VT

I am blinded by these blue-white headlights. I am 68 and it's making night driving harder. There was nothing wrong with the warm yellow-white headlights. Just drive the speed limit and you won't out run your vision. Regarding safety, having all cars run automatically run headlights while running, day and night, would help tremendously.

B.1623 June 6, 2021 — Culver City, CA

I avoid driving at night because of these.

B.1624 June 6, 2021 — Endicott, NY

Each year, in the past few, my discomfort increases with the rise of SUVs & led lights; this is also a safety issue for older drivers, and therefore for everyone!

B.1625 June 6, 2021 — Hollister, CA

Being blinded by another driver's headlights and possibly causing a car crash is the result of an industry that values looks and buyer appeal over safety. Past time this issue was fixed.

B.1626 June 6, 2021 — Hope Valley, RI

I'm tired of being blinded by LED lights. I am afraid of getting into an accident because of it.

B.1627 June 6, 2021 — Los Angeles, CA

How did it get to this point?

B.1628 June 6, 2021 — Los Angeles, CA

Its dangerous to drive at night. I cannot see for the glare!!

B.1629 June 6, 2021 — Pomona, CA

I hesitate to drive at night because of high-mounted bright lights behind me (I'm 70)

B.1630 June 6, 2021 — Portland, OR

omg, finally - thank you! this has to stop.

B.1631 June 7, 2021 — Abbotsford, Canada

Truck driver, and they're too bright

B.1632 June 7, 2021 — Aiken, SC

I am constantly blinded by oncoming headlights, to the point that I avoid driving at night. This is ruining my social life!

B.1633 June 7, 2021 — Anchorage, AK

These lights are absurdly bright and make it hard to see- an accident waiting to happen. I hate them so much!

B.1634 June 7, 2021 — Blairsville, GA

hard to see at night

B.1635 June 7, 2021 — Boulder, CO

These lights are a danger to all other drivers on the road. How selfish can you get? Ban them!

B.1636 June 7, 2021 — Brewster, NY

I have also been blinded by these after market high power LED lights.

B.1637 June 7, 2021 — Gatineau, Canada

Older people are having a hard time driving at night since they released those headlight.

B.1638 June 7, 2021 — Greenwich, CT

I've been struggling with bright lights for offer 10 years now - from oncoming traffic, rear view cars and stop/blinker lights. I want to ask to also advocate limiting luminance on traffic and road side lighting (such as signage and billboards). Furthermore, I would like to see after-market lights, typically meant for off-road use, banded for use on roads (such as the LED arrays on bumpers, grills, mirrors and roofs, as well as extra flood/beam lights). Lastly, I would like to see strong limits on the use of high beam lights, both through better driver education and stricter enforcement. There is an increase number of drivers using high beams, many of them turning those on by default as soon as they start their cars.

B.1639 June 7, 2021 — Hollywood, FL

I am signing because this kind of new-fangled light has nearly blinded me on several occasions and NOW I cannot in good conscience drive at night. Fancy for you [whoever you are who owns these

lights] deprives me of freedom! Maybe someone out there can make some kind of lens that really neutralizes or diffuses glare might be the answer. IF I am forced to buy new night-driving goggles, so be it.

B.1640 June 7, 2021 — McLean, VA

I cannot drive on winding two-lane roads in Fairfax County, Virginia at night because on-coming vehicles blind me with their bright lights. Enough is enough. There are hundreds of highly paid automotive and lighting engineers who could resolve this issue if the government would mandate a solution.

B.1641 June 7, 2021 — Morristown, NJ

I drive at night and completely agree that this is an overlooked danger which needs to be addressed.

B.1642 June 7, 2021 — New York, NY

The macho 50% of Americans are blinding and deafening the other 50%.

B.1643 June 7, 2021 — Northampton, MA

I've literally had panic attacks driving at night faced with oncoming headlights.

B.1644 June 7, 2021 — Owen Sound, Canada

I find the brightness and glare from the newer LED headlights on higher-riding vehicles like trucks and SUVs to be overwhelming, and even dangerous. It can often cause drivers like me, in a conventional sedan-type vehicle, to have to avert our eyes.

B.1645 June 7, 2021 — Pittsburgh, PA

These lights are dangerous! I have had to adjust my driving many, many times, oftentimes pulling over to the berm, to get out of the glare of those vehicles wielding them.

B.1646 June 7, 2021 — Rockwall, TX

I drive a lot of 2 lane rural roads. It's terribly blinding.

B.1647 June 7, 2021 — San Francisco, CA

I'm signing because these blinding vehicle LED headlights including, halogen and HID lights are a blinding nightmare for me. In particular, SUVs blind me when their headlights' glare is reflected in my rear view mirror as well as, directly from oncoming traffic. Automakers promote them as a safety feature when, in reality they pose a danger. I find myself reflexively removing and raising my arm and shielding my eyes with my hand, which further interferes with my view and further disrupts my focus. Lexus and other luxury vehicles began coming out with LED lights in 2006 and in the past several years they are being pushed by most automakers because the cost of manufacturing of the lights has become cheaper. As usual, it's about the money and lack of regulation, quality control, and lack of training and know-how on using the proper installation kits and alignment of the headlight beams. Especially aftermarket LED light bulbs, which are intended for off-road vehicles, not basic transportation vehicles. We need better training, quality control and regulation of these types of headlights. Typically, as in many other American industries, the kind of training, quality control and regulation is given short shrift in the rush to get the newest, improved "bigger and better" product out the door to compete in the market to make more money for the Company.

B.1648 June 7, 2021 — Seattle, WA

Not only are extremely bright lights dangerous to the health of our population, but can cause a whole demographic of people to stop driving. For example, people with headaches and seizures are typically unable to drive due to the increasing bright lights that are being put into vehicles. The new Hyundai has 9 bright blue-white lights to "assist" people to see safer. We have road lights and if the area is too dark then we need more road lights. Today, while driving my child they had a seizure because of new brake lights on the vehicle in front of us that blinked in a strobe-like pattern depending on how hard the person was braking. These types of lights should be banned due to people being sensitive to light patterns and the intensity of lights. These types of bright lights and blinking should be only allocated for emergency vehicles.

B.1649 June 7, 2021 — Spartanburg, SC

I was surprised, but heartened, to find I wasn't the only person to find the headlights coming at me uncomfortably bright! I thought before reading the NYT piece that it was just me. Let's stop and reassess what we mean by "safety..." not being able to look where you're going at night surely doesn't fit the definition. .

B.1650 June 7, 2021 — Stafford, VA

I shouldn't have to squint to drive.

B.1651 June 7, 2021 — Tlaquepaque, United States

having to use rear mirror damping but still get blinding light from side mirrors

B.1652 June 7, 2021 — Wimborne, Dorset, ENG, United Kingdom

I am being "Blinded by the Light" Courtesy Bruce Springsteen and Manfred Mann. And those strobing bicycle headlights are blinding and dangerous. These lamps/lights need to be regulated.

B.1653 June 7, 2021 — Winter Haven, FL

I am very sensitive to light making night driving nearly impossible. The risk of facing these headlights is dangerous for some as the extreme brightness causes a light blindness, possibly causing an accident.

B.1654 June 7, 2021 — salt lake city, UT

Number of high position lights shining right in on car drivers. Drivers license that will not lower their lights.

B.1655 June 7, 2021 — west jordan, UT

I'm signing because the headlights are blinding

B.1656 June 8, 2021 — Gettysburg, PA

I'm signing because I still want to be able to drive at night, and the blue lights are blinding.

B.1657 June 8, 2021 — Milwaukee, WI

We need to keep safety first on our roads and eliminate the hazards that can cause distraction, especially when driving at night.

B.1658 June 8, 2021 — Piedmont, SC

Drivers can help reduce the blinding effects of their vehicle's lights by turning off the fog lamps. Some drivers don't even know when these lights are on and they add to the light emitted from the vehicle. At least 20% of drivers leave fog lamps on full time.

B.1659 June 8, 2021 — South Hadley, MA

I have been saying this for DECADES, even more so now that I am a professional driver! What is worse is that many vehicles are sporting four or six lights. I believe that many drivers do not realize how bright their lights are nor how to turn their "extra" lights on and off! Chevy, South Hadley, MA

B.1660 June 9, 2021 — Alameda, CA

I have stopped driving at night due to cars that have bright white lights.

B.1661 June 9, 2021 — Anaheim, CA

I support this petition.

B.1662 June 9, 2021 — Ann Arbor, MI

These bright lights are a significant safety hazard

B.1663 June 9, 2021 — Austin, TX

I thought I was alone in noticing this problem. Glad to hear that my opinion is shared.

B.1664 June 9, 2021 — Austin, TX

I agree completely with the author and thank him for this petition. I believe this sort of intense light that shines directly into the windshield of oncoming traffic and rear view mirrors of others should be illegal and changed in some way to dim their effect on other drivers.

B.1665 June 9, 2021 — Birmingham, AL

There are certain vehicles in which the headlights are blinding and cause unsafe and very annoying driving conditions

B.1666 June 9, 2021 — Childersburg, AL

I have to pull off of the road every time one of the vehicles get behind me or slow down to a crawl when coming toward me.

B.1667 June 9, 2021 — Emmett, ID

The extreme bright lites are insane and dangerous. I hate them. I also feel that way towards the police car flashing lights. What ever happened to the ole single red flashing light on top of a police car that everyone knew what it meant and how to respond?

B.1668 June 9, 2021 — Georgetown, Canada

I feel this is the right thing to legislate as well as have all Truck and SUV night lights angled down a bit more as they are also blinding at night and come level with my eyes in any car.

B.1669 June 9, 2021 — Lawrence, KS

These bright headlights are such a problem for me, thus I find myself not even wanting to drive at night.

B.1670 June 9, 2021 — San Juan, United States

pone en peligro el conducir en la noche porque la brillantez de los focos perturban la visibilidad del conductor que recibe el resplandor

B.1671 June 9, 2021 — Wilsonville, OR

These extremely bright headlights do impair the driver whose eyes are extremely bothered by having to advert their gaze from the road till the offending oncoming vehicle passes. Likewise one has to flip their rear view mirror up when you have a vehicle behind you with these LED lights, but they still can be very disturbing as when said vehicle is fairly close their LED lights are reflected in my side view mirrors. Only thing for that is to change lanes, if another lane is available, to get away from that vehicle that is following. They should be illegal as they do affect other drivers.

B.1672 June 10, 2021 — Atascadero, CA

SUVs/trucks are the worst because their lights are high off the road an aimed straight into the oncoming car. The headlights that automatically dim work terribly on country roads that curve or have lots of dips in them and the lights aren't set up to dim far enough away from the oncoming car. The lights are a huge safety problem.

B.1673 June 10, 2021 — Charlotte, NC

These blinding headlights are dangerous. It used to be illegal to drive on an interstate with your high-beams on; why are these super-bright headlights allowed?

B.1674 June 10, 2021 — Duluth, MN

They are not only distracting but it also difficult to see anything past them. I am most aware of this while driving through areas with a lot of deer as I scan the roadside watching for the tell tale reflection in their eyes.

B.1675 June 10, 2021 — Durham, NC

In the last few years I've begun to find that I can't see the road very well at night due to the excessively bright glare of oncoming headlights. Everything other than the headlights looks black to me. I feel this is not only unpleasant, but also unsafe. When in traffic, I sometimes have to avert my eyes from the bright red LED brake lights of cars in front of me. Some cars are much worse offenders than

others. I've also noticed that even LED-based stoplights can be so bright that I can see them from a mile away but I can't see the surroundings. I thought for a while I was just getting old and my eyes were not as good as they used to be (I'm in my early 40's), but a recent news article on the subject has me convinced that this is not my imagination -- it's a genuine problem experienced by many people.

B.1676 June 10, 2021 — Palo Alto, CA

I'm signing because my eyes have been painfully effected by these over-bright headlights for years! I like the softer old lights. Why do we need these when most cities are so flooded with LED's anyway?! They are harsh and they hurt the eyes.

B.1677 June 10, 2021 — Tampa, FL

I usually wear sunglasses when I drive at night or raise my left hand to block oncoming traffic. Can we also lower the height of SUVs & other taller vehicles so they aren't at the level of the eyes of the car drivers? Why can't their headlights be at the same level as cars, since they need to hit the road rather than blind oncoming drivers? These lights are also blinding in rear and side view mirrors that I have to redirect at night.

B.1678 June 11, 2021 — Berkeley, CA

As an independent elder, I have noticed for years that the blinding lights are creating unsafe driving conditions. They're also threatening my independence as the lights are a serious risk factor for accidents that I want to avoid. They're doing the opposite of what they're intended to do — public safety!

B.1679 June 11, 2021 — Black Hawk, CO

It is vital to restrict the brightness for safety. "Brights" are available when not following someone or approaching someone coming the other way. That is enough. But what really needs attention is the popular trend toward people using their fog lamps at all times. It is illegal to do so in many places. Yet it is never enforced. Some of these fog lamps are as bright or brighter than the headlights. They are for FOG, not regular driving, and should never be used when approaching or following someone. They have somehow become "fashionable" to be a big shot showing off that you have fog lamps.

B.1680 June 11, 2021 — Indianapolis, IN

Blue/bluish, too high and too bright even with streetlights on. The driver with these lights may see better, but those impaired/blinded may end up aiming for such vehicles unintentionally...

B.1681 June 11, 2021 — New York, NY

Nathan Currier

B.1682 June 12, 2021 — Australia

Please sign

B.1683 June 12, 2021 — Richmond Hill, NY

Dionisia p viloria

B.1684 June 12, 2021 — Tempe, AZ

LED lights have been a terrible addition to our daily lives and overall health. To continue allowing LED lights on a car, either headlights or taillights, would only prove that our leaders, car manufacturers etc, care nothing about our safety while we're on or off the road. LED headlights blind drivers and black out everything around their glare for only a moment, but it only takes a moment to cause an accident. The worst part is the blurred vision we're left driving with for several moments after when anything could happen.

B.1685 June 16, 2021 — London, KY

My experience is that these lights are extremely bright and make it nearly impossible for me to see anything else when opposite them. My husband is a trucker and it is equally impairing to them. We value our CDLs, our lives and our fellow drivers lives.

B.1686 June 18, 2021 — Portland, OR

I'm one of the older drivers who is blinded by the lights! Fix them!

B.1687 June 19, 2021 — Durham, NC

Where I live, the roads are 2-lane, hilly, curvy, and unlighted, and it's deer country! The blinding glare from oncoming LED headlights make it impossible to see upcoming curves and in-road hazards such as deer. I do not have this problem with oncoming halogen headlights.

B.1688 June 20, 2021 — Graton, CA

These lights cause more accidents, affect health and vision and impact bird migration.

B.1689 June 20, 2021 — New Braunfels, TX

These new lights are to bright

B.1690 June 20, 2021 — Philadelphia, PA

These headlights should be made illegal immediately. Besides being blinding, those who drive with them are not able to see what is in front of them and turn on their bright lights and running lights to help see better. The color temperature does not light up the road as well as other headlights do.

B.1691 June 20, 2021 — Tijeras, NM

I have, like most all drivers, been nearly unable to see for a number of seconds while driving due to these terrible lights that Never should have been allowed on cars but should Obviously be outlawed from being installed on new vehicles and removed retroactively from existing ones. Do we Need to wait for X number of highway deaths before a serious change is made?

B.1692 June 23, 2021 — Searsport, ME

Blinding headlights make it impossible to see the road or any pedestrian or cyclist beside the road. They are horrible to have in the rear view mirror. Driving at night for any great distance in traffic becomes visually exhausting, which is unsafe for everyone.

B.1693 June 24, 2021 — MD, United States

My father deals with this issue regularly and has a huge problem seeing the lines on the road when faced with these unnecessarily bright headlights. I'm not against HID's but I am against the overuse of various types of LED's especially because I've seen an uptick in my area of people applying many aftermarket parts to their vehicles in recent years.

B.1694 June 26, 2021 — Willimantic, CT

cause i'm short and i drive a short car. i'm at eye level with these fucking mini-suns and i'm tired of the road migraines >:(

B.1695 June 29, 2021 — Reykjavik, Iceland

The LED headlights on cars are destroying our environment and our eyes

July 2021

B.1696 July 1, 2021 — Livingston, TN

I've almost gotten into multiple wrecks because these types of headlights blind me. They're beyond distracting - they actually become physically painful and it becomes hard to focus on anything else when they're in my view.

B.1697 July 4, 2021 — Saint Paul, OR

I read through the petition, and I want to be clear that my signature is intended to support a ban on use of LED lights at night while pointed at other drivers. It's important on our farm to have light bars and such to help illuminate equipment we may be trying to fix at night before we need it the following day. But we use switches to control them, and no aftermarket LED headlights are installed. Those who are not responsible in the installation and/or use of LED lights should not be allowed to use them, or at least fined.

B.1698 July 11, 2021 — Irvine, CA

Blinding lights are a hazard to lives

B.1699 July 14, 2021 — Australia

Bright headlights are incredibly dangerous. There needs to be strict regulation to limit their brightness. I once couldn′t even see the road in front of me because I was blinded by the headlights of a new Mercedes SUV.

B.1700 July 18, 2021 — El Granada, CA

With the blinding head on lights at night on my local two lane roads, it is often impossible to see if there is any dangerous object in the road ahead. Most of the time roads are clear, but I have witnessed several times where heavy damaging items are laying in the middle of the road that likely fell from a truck. If I would hit one of these items that I could not see, it could cause death/injuries to me and/or people in the on coming traffic.

B.1701 July 18, 2021 — West Point, GA

Please ban these headlights. They blind me even though I focus on the passenger side road lines. People refuse to dims these blinding headlights are also contributing to theses road deaths.

B.1702 July 20, 2021 — Halifax, Canada

Canada here: - Our divided highways are not level on each side, so you may always be below the ″cut off″ point for some parts of the highway - We still have a lot of side roads where you will be blinded by these, especially if it has small hills (toyota corolla you are the worst here). If you come over a hill you will be blinded - We do not have a law to mandate self adjusting headlights, so all trucks with a load in the back or just high off the ground will blind you with these headlights This is the most selfish thing I′ve seen auto manufactures do. Jeep you are the worst and Toyota how dare you. You are selling the vehicles like this knowing the ″a-holes″ of the world will buy it and no-one cares... Well we care! Enough is enough. These lights are for off road use.

B.1703 July 21, 2021 — Chicago, IL

At the age of 66, these needlessly overly-bright and misdirected headlights and streetlights have made impossible to drive safely especially on highways. Many times I had to pull over and let my husband drive who does not have astigmatism.

B.1704 July 21, 2021 — Lafayette, CA

Having to face blinding bright white headlights is a painful experience, damaging to our eyes, and dangerous. Thank goodness there is proof that they need to be banned.

B.1705 July 24, 2021 — Jacksonville, FL

I drive a lot early in the morning for work. Just about every morning I experience a vehicle with blinding light and most of these people have no consideration for other drivers. It is very difficult to drive when these lights remain behind you in your rear view or head on. I find myself dodging the reflections from my mirrors or moving out of the way, just so I can see.

B.1706 July 25, 2021 — Samford Valley, Australia

I agree - I’ve been blinded by some of these and nearly come to grief !

B.1707 July 31, 2021 — Jacksonville, FL

For Austin Lee Beebe and my road rage ¯_(ツ)_/¯

August 2021

B.1708 August 10, 2021 — Victor Harbor, Australia

I agree

B.1709 August 15, 2021 — Portland, OR

these headlights are dangerous.

B.1710 August 17, 2021 — Sunnyvale, CA

Where do you actually sign the petition? All I see is the Take the next step! which is a funding request. How about an immediately obvious button?

B.1711 August 25, 2021 — Shirley, IN

I am tired of people putting my personal safety and others at risk by acting smug with their bright headlights and motorcycle headlamps on full bright during the day, as they're passing by on the road. Let's get this petitioner's goal achieved, and get the ball rolling!

B.1712 August 26, 2021 — Ithaca, NY

This is common sense. Anyone who hasn't been blinded in a dangerous way by HID or LED headlights is in for a serious scare when it finally happens

B.1713 August 27, 2021 — Liverpool, ENG, United Kingdom

These lights are dangerous and for people who suffer from Migraine , painful .

B.1714 August 31, 2021 — Amersham, ENG, United Kingdom

I am fed up with being dazzled by these extremely bright headlights.

B.1715 August 31, 2021 — Harrow, United Kingdom

Driving on a road that has street lights or not when a vehicle approaches with glaring lights all visibility is lost and the chances of a crash are extremely high.

September 2021

B.1716 September 2, 2021 — Durham, NC

Shelley Reaves

B.1717 September 4, 2021 — New Westminster, Canada

It blinds my eyes at night with headlights that are too bright. It's very dangerous for drivers

B.1718 September 9, 2021 — Danbury, CT

Also daytimes lights are a hazard. DC

B.1719 September 10, 2021 — Rhyl, WLS, United Kingdom

Peter jones

B.1720 September 12, 2021 — Orem, UT

This needs to be addressed at the national level with a total recall of all of these new vehicles using this technology. I think given a choice, most people wouldn't choose these awful lights, but it's what comes standard and who is going to choose to change their headlights at the cost of 100s of more dollars.

B.1721 September 12, 2021 — Orem, UT

Do not like being blinded by headlights that have no business being that bright. They do not increase safety but are instead potentially unsafe.

B.1722 September 16, 2021 — Durham, NC

These lights create a hazard for all drivers!

B.1723 September 17, 2021 — United Kingdom

LED headlights are blinding even when dipped especially in rainy conditions. I use my fog lights all the time now just to pick out the road nearside and centre white lines which are increasingly being left out after road repairs and maintenance.

B.1724 September 18, 2021 — Halifax, Canada

Please stop this nonsense! We got 3′ lifted trucks/jeeps with LED headlights and LED foglights. Only one who can see is that guy in the jeep. No-one else can see around him! Subaru, you just did this! This is crazy, what are we doing??

B.1725 September 19, 2021 — Portland, OR

Add these dangerous LED headlights to under lit cyclist weaving in and out of traffic and unlit pedestrians dashing across the street wearing black at night in the rain during the early dark days of

winter in high density neighborhoods in the city and it is simply a cluster bomb of accidents waiting to happen. So scary to imagine a car accidentally hitting a pedestrian or cyclist. No more High beam LED headlights. Cross the street at the cross walk. Lights and helmets on cyclists. Even lights on pedestrians. No random dashing across the street. I'm talking dense city streets.

B.1726 September 20, 2021 — Bay Village, OH

I just purchased a 2021 VW ID4 with LED headlights. However as a driver age 70 I have noted that headlight glare is definitely more of a problem for me at night AND I do not have 20/20 vision with my glasses on! This change makes sense.

B.1727 September 22, 2021 — Fairport, NY

In my experience, bright lights at road level create a halo of darkness, where you can't see the vehicle itself or what is behind or around those lights. A significant contributor to dangerous situations, no doubt!

B.1728 September 22, 2021 — Oxnard, CA

I've been blinded by these ridiculously bright lights in a construction zone and hit a barrier that wasn't visible as a result.

B.1729 September 22, 2021 — Sardinia, OH

The last time I visited my family in the city I came down with a severe migrane headache from the continues onslaught of extremely bright, blinding LED headlights. The sheer amount of light pollution between the streetlights (now LED) and the headlights in virtually every cat on the road destroys my night vision, makes it impossible for me to use my mirrors for safety, and makes nighttime divinga exceptionally difficult. Stop this madness, NOW.

B.1730 September 22, 2021 — Vermillion, SD

LED lights and the light pollution they cause have negative effects on our health and environment. People share a common heritage to the skies and stars. Enjoyment of this common heritage is diminished by bright LEDs and the light pollution attributed to them.

B.1731 September 23, 2021 — Austin, United States

I have to look away when faced with the LED lights in oncoming traffic. Even the low beam lights used in the daytime are a problem. AN OVERWHELMING majority of drivers believe new car headlights are becoming far brighter than they need to be, according to research by The RAC. The motoring group found 91% of those surveyed believe car headlights are becoming too bright, with 60% admitting they're regularly dazzled, even by dipped headlights.

B.1732 September 23, 2021 — Bentonville, United States

These lights are dangerous on rural roads for oncoming traffic.

B.1733 September 23, 2021 — Chicago, IL

Phyllis Abrams

B.1734 September 23, 2021 — Morristown, NJ

I have been victimized by many drivers at night with blinding headlights especially from the rear.

B.1735 September 23, 2021 — Park Forest, IL

The super bright lights make it very hard to see the actual traffic, much less pedestrians. The LED craze is in so many stores now, and some make it impossible to look up, but at least they're stationary, and I can avoid them. But the one on cars— in front of me, or in back of me— are temporarily blinding, and I truly hate what the do to our vision. Please use some common sense to get rid of known driving hazzards!

B.1736 September 23, 2021 — Providence, RI

RON CAVALLARO This and police car strobe lights are a menace!

B.1737 September 23, 2021 — United States

I suffer greatly from these HD blinding blue ray lights that has evidence that it's HARMFUL for human eyes.

B.1738 September 24, 2021 — Los Angeles, United States

This needs to be done

B.1739 September 25, 2021 — Sylmar, CA

I'm signing because I have experienced many times the dangerous hazard of being temporarily blinded by oncoming overly bright LED headlights and nearly wrecked my car on numerous occasions because I couldn't see the road nor anything or anyone around my vehicle while those lights adversely affected my vision. I agree that headlights should be regulated and restricted to lower levels of brightness that will create safer driving conditions for drivers that are facing them.

B.1740 September 25, 2021 — Tampa, FL

There has to a limitation set on the blinding headlight brightness. They only get brighter and brighter.

B.1741 September 27, 2021 — Downey, CA

This is a safety issue-clearly!!! We,the public should not have to insist that the producers of these products cease and desist production and distribution ...it should be illegal to:produce,distribute,sell,use for use on our roads, highways and byways!

B.1742 September 28, 2021 — Lewisville, TX

LED and HID headlights blind me when I drive at night. I have to slow down because I really can't see because of these super blinding lights in my eyes. These lights cause a danger to oncoming traffic because they make it impossible to see.

B.1743 September 29, 2021 — Cleveland, TN

Ban Blinding Headlights and Save Lives!

B.1744 September 29, 2021 — Spanish Fork, UT

I have personally had trouble seeing momentarily while driving at night due to blindingly bright headlights either behind me, or oncoming the opposite way. These can be very dangerous and we need to put an end to them!

B.1745 September 30, 2021 — Hesperia, CA

I hate those freaking lights

October 2021

B.1746 October 2, 2021 — Reading, ENG, United Kingdom

I have stopped driving at night because of these awful lights.

B.1747 October 4, 2021 — Warren, MI

I agree 1000% I actually bought Tac Night vision glasses not ready to give up driving! But the experts say you get 40 more feet of distance you can see! Lol

B.1748 October 7, 2021 — Salford, ENG, United Kingdom

Forced to pull over and let vehicles behind take over and nearly closing eyes from oncoming vehicles

B.1749 October 7, 2021 — United States

I hate those lights u cant see shit when there coming at u blind ur ass

B.1750 October 8, 2021 — Hell, AE

I have a hard enough time seeing at night WITH my glasses much less when someone is brightlighting me with the light of 1000 suns and your eyes take time to recover after and if anything is in the road in front of you there is a good chance you're not seeing it and smashing it full speed. Ridiculous they've ever been allowed at this brightness ever anyway.

B.1751 October 8, 2021 — Leesburg, FL

I agree there have been many times I almost wrecked and literally felt like I was not going to make it. Many people do blind other people on purpose I don't think some people understand how dangerous it is or maybe they do and just don't care.

B.1752 October 8, 2021 — Lexington, KY

It is not legal for a blind person to drive and therefore should not be legal to blind someone while driving. I have experienced these 'blinding lights' and because of them, now only drive at night when absolutely necessary. I regret that my ability to go out at night has been restricted. Since AAA and AARP have no interest in helping with this problem, perhaps a class action suite against the manufacturer would be appropriate. I volunteer to be your lead plaintiff.

B.1753 October 8, 2021 — Mableton, GA

These new headlights are even to bright for daytime usage

B.1754 October 9, 2021 — Appleton, WI

Mine too!

B.1755 October 9, 2021 — Appleton, WI

Can you get Tac Night vision in prescription glasses?

B.1756 October 9, 2021 — Appleton, WI

I hate them so much. I have gotten quite a few migraines from bright sunlight and and sensitive to bright lights.

B.1757 October 9, 2021 — Appleton, WI

I have pulled over and let people pass because of this

B.1758 October 9, 2021 — Saranac Lake, NY

I almost lost my life twice because of these stupid lights. I was blinded by oncoming traffic and couldn't see that traffic stopped in front of me. These lights should've been banned years ago. Until someone dies and the family sues, nothing will ever be done.

B.1759 October 10, 2021 — Jacksonville, NC

The headlights are blinding!

B.1760 October 11, 2021 — Allyn, WA

Because of our northern latitude, we get early darkness in fall and winter. On several occasions, I have narrowly avoided an accident because of these blinding headlights. Even when a driver switches from high-beams, the headlights appear overly bright to oncoming drivers. On our rural roads with minimal installed lighting, drivers tend to keep headlights on high for better visibility, unaware that their lights are blinding oncoming drivers. We also get frequent fogs during these colder months, which scatters the bright light, creating an even larger zone of bright-blindness. European countries require auto manufacturers to mitigate this hazard. Why is the US so backward on this?

B.1761 October 11, 2021 — House Springs, MO

I live off of a dangerous road and have been blinded so many times by oncoming halogen headlights it's a miracle I haven't veered off the road. I am shocked that such a dangerous nuisance is not being acknowledged by the masses and rectified:

B.1762 October 11, 2021 — North Myrtle Beach, SC

They are blinding and very dangerous

B.1763 October 12, 2021 — Wise, VA

I believe this to be true.

B.1764 October 14, 2021 — Boise, ID

As a wearer of glasses these produce a ridiculous amount of glare, and as a driver of a newer care with them there is no discernable advantage to visibility. I would rather not have them nor be blinded by them.

B.1765 October 14, 2021 — Edgewood, MD

I hate it to honestly people need to be Courteous and careful on the road

B.1766 October 15, 2021 — Hove, ENG, United Kingdom

The headlights are too bright.

B.1767 October 18, 2021 — Albany, NY

These harsh and blinding LED headlights are a danger to all. You're not driving safer if you are blinding other drivers. Please ban LED headlights now.

B.1768 October 18, 2021 — Las Vegas, NV

I hate driving at night because headlights have become ridiculously bright in recent years

B.1769 October 18, 2021 — Rochester, ENG, United Kingdom

Blinding headlights are dangerous

B.1770 October 20, 2021 — Federal Way, WA

These blinding lights are making it very hard to stay on the road when approaching a vehicle equipped with them.

B.1771 October 21, 2021 — Pottstown, PA

These lights are totally unsafe!

B.1772 October 25, 2021 — Lebanon, TN

I support this petition. Please review, sign and share my son's petition to Dell. Thank you! God bless. https://chng.it/7jKzphDD

B.1773 October 25, 2021 — Long Beach, CA

In one particular scary instance I remember being at a four way stop late one night and all three opposing vehicles had these extra bright lights glaring into the intersection, and as my vision was practically blinded I barely saw, at the last moment, some pedestrians start to come in front of my car as I began to drive forward. Thankfully I noticed them in time and stopped, but that was too close for comfort, not to mention the terrible uncomfortableness in my eyes from that horrific, blinding brightness. And unfortunately this blinding is all too common in many circumstances, pretty much every day. This needs a remedy, like yesterday!

B.1774 October 25, 2021 — Tigard, OR

Passing by a whole line of cars coming from the opposite direction is scary. The brightness makes it more difficult to see in front of me. This increase in brightness has become remarkably more problematic over the last few years.

B.1775 October 26, 2021 — Decatur, GA

I cannot see when driving at night and passing other cars that have bright lights

B.1776 October 29, 2021 — Antioch, IL

I can't stand these blinding lights. They are unnecessary!

B.1777 October 29, 2021 — Bristol, ENG, United Kingdom

I am sick of being blinded by over bright headlights that make roads less safe

B.1778 October 29, 2021 — Spring Grove, IL

These lights are blinding and absolutely dangerous for oncoming vehicles! Sure glad THEY can see! And some of the vehicles have three lights on both sides! WTF!!! Whoever invented those ought to be.....

B.1779 October 31, 2021 — Carbondale, IL

I am signing this petition, because I suffer from chronic inflammation of my optic nerves (which causes bright white vehicle headlights to be impossibly blinding). I am able to handle the soft yellow headlights without too much difficulty. I am speaking up for the many thousands of people who suffer from optic nerve issues that cause artificial lights to appear extremely bright. -Chris Weston

November 2021

B.1780 November 1, 2021 — Gilberts, IL

I really hate those bright lights at night.

B.1781 November 1, 2021 — Halifax, Canada

We made it! 25,000 signatures! Let's get some action.

B.1782 November 1, 2021 — Lexington, KY

Bright lights in vehicles cause issues for the rest of us on the roads. This is dangerous. While the person driving with LED and HID lights may see better, the rest of us are blinded by them. Please ban these lights.

B.1783 November 1, 2021 — Pahoa, HI

I hate the LED lights on cars & trucks!

B.1784 November 2, 2021 — Yardley, PA

Ban the blinding lights! Light pollution is ruining neighborhoods, commutes, and a serious danger on all roads!

B.1785 November 3, 2021 — Boise, ID

I'm signing because I have been blinded by LED headlights and nearly crashed.

B.1786 November 3, 2021 — Riverside, CA

I think safety should always come before selfish and/or "cool." It used to be law to dim high beam lights as a courtesy if another vehicle is coming. These new halogens or whatever are even brighter than older high beam brights were/are. They are temporarily blinding and are causing many problems to other drivers. Get rid of these and encourage yearly eye exams. People need glasses not brighter lights.

B.1787 November 5, 2021 — Friday Harbor, WA

LED headlights have no place on our roadways period!!! They are so blinding! And you see spots afterwards. I find myself looking at the far right side of the road, but then I'm not even watching the road in front of me. Please outlaw them!!!

B.1788 November 6, 2021 — San Antonio, TX

I just click on my high beam on them they click on their even brighter ones but I leave mine on till they go by.

B.1789 November 7, 2021 — Independence, KS

they need to outlaw these lights. They blind you so you can't even see what lane you are in. DANGEROUS

B.1790 November 10, 2021 — Boston, MA

Morons Drive With These Blinding Lights That's Why They Look Brighter Far Away

B.1791 November 11, 2021 — Clinton, MA

They literally blind you

B.1792 November 11, 2021 — Springfield, OH

I find the bright lights difficult to.navigate around and annoying.

B.1793 November 11, 2021 — Warren, OH

These headlights create dangerous conditions for oncoming drivers. They are blinding.

B.1794 November 12, 2021 — Sonora, CA

LED headlights are painful, blinding and dangerous, creating a situation where we can no longer see at night while driving, which is especially dangerous when approaching a crosswalk with an oncoming car with LED lights.

B.1795 November 13, 2021 — Star, ID

I'm signing this petition because this is a justifiable cause! Just experienced this issue tonight!!!!

B.1796 November 13, 2021 — Vashon, WA

I have an astigmatism in both my eyes & these lights have caused that worst starring of any lights I have ever seen. It completely blinds me even just at dusk.

B.1797 November 14, 2021 — Poplar Grove, IL

Blinding lights are a nuisance

B.1798 November 14, 2021 — Seattle, WA

These lights totally blind me.And no I don't wear glasses.

B.1799 November 14, 2021 — Waynesburg, OH

The older I get, the more I hate them!!!!

B.1800 November 15, 2021 — McCall, ID

You can't see at night for them blinding you

B.1801 November 15, 2021 — Valdese, NC

they blind drivers coming towards them

B.1802 November 16, 2021 — Adelaide, Australia

I've been blinded!

B.1803 November 16, 2021 — Nesconset, NY

Its needed.

B.1804 November 16, 2021 — Pitt Meadows, Canada

I've been snow blinded because of the LED lights won't melt the snow and from drivers coming head on. They look like high beams and it is blinding.

B.1805 November 16, 2021 — Roberts Creek, Canada

I've been blinded by those dangerously bright LED headlights more than once. They're a menace on the road.

B.1806 November 17, 2021 — Akron, OH

I feel Endangered by these new lights!!

B.1807 November 23, 2021 — Dover plains, NY

The led headlights are getting out of hand!!!

B.1808 November 24, 2021 — Lake Elsinore, CA

Those Led lights are way to much blue light for those who were glasses. At some points at night we can't even see the road because of overly high Led lights blinding us from behind and oncoming traffic. More fatalities will come from these light source while on the road.

B.1809 November 24, 2021 — Manchester, NH

The public would benefit from a serious inquiry into how these lights affect other road users, and regulation to ensure that manufacturers are not putting out products that are unnecessarily unsafe

for others. Car manufacturers should be held to a high standard of safety for a community—not just the driver.

B.1810 November 25, 2021 — Endicott, NY

I've come close to hitting parked cars and pedestrians walking because of these headlights. Some lights are way too bright. And some people have 4 or even 6 of these headlights. BAN THEM!

B.1811 November 27, 2021 — Joliet, IL

It's hard to drive at night, dangerous, and scary for me with my kids in the car

B.1812 November 27, 2021 — Ramsey, NJ

Night driving has become a danger imposed on drivers by Detroit. Enough!

B.1813 November 27, 2021 — Sorrento, FL

I CAN'T FUCKING SEE AT NIGHT

B.1814 November 28, 2021 — Cupertino, CA

I have driven over 250,000 miles over the last 20 years. The recent change to bright lights on an increasing number of vehicles is not just an annoyance, but a serious safety hazard to other drivers. If the oncoming traffic has any vehicle with this new type of lights, I find that the light is quite blinding, and reduce severely my ability to see the road. Please do something about this before it is too late and we have too many vehicles on the road with this type of light!

B.1815 November 28, 2021 — Richmond, IN

They have blinded me to the point that I've had to completely pull off the road and stop!! I no longer can enjoy evening rides with my grandchildren

B.1816 November 28, 2021 — The Villages, FL

It's hard to see when headlights like that are coming at me.

B.1817 November 29, 2021 — Wichita, KS

I don't want to die so some entitled douchebag can follow spacecraft and pterodactyls at night!

B.1818 November 30, 2021 — Augusta, KS

I am tired of being blinded by these lights. I have to wear special glasses at night to drive and even then sometimes they are not enough.

B.1819 November 30, 2021 — Corning, AR

I have stopped driving at night because I can not handle the bright lights. Every time I pass a vehicle that has these headlights I end up having trouble refocusing and arrive at home with the start of a migraine. There is no reason for lights to be this bright.

B.1820 November 30, 2021 — Glasgow, SCT, United Kingdom

They are too bright! No need for it

B.1821 November 30, 2021 — Northumbria, ENG, United Kingdom

These lights are a joke and should be banned.

B.1822 November 30, 2021 — Temecula, United States

These lights are absolutely dangerous and I hope to god we can get a new law in place to save lives. I've dealt with these lights on two lane highways and it's not a nice feeling, you pretty much have to brake and wait cause you cannot see anything. Enough already, I know the whole inconsiderate jerk in a lifted truck is the life blood of the police force and it's supporters but at some point the public they supposedly serve must be taken into account.

B.1823 November 30, 2021 — Worth, IL

I believe these lights are a hazard on the road

December 2021

B.1824 December 1, 2021 — Lake Station, IN

These lights are blindingly bright and so unnecessary in city driving. They make it hard for other drivers, to see what's going on.

B.1825 December 1, 2021 — Leicestershire, ENG, United Kingdom

I was driving with my family the other day and the headlights blinded me and could have caused a serious accident

B.1826 December 1, 2021 — Oak Lawn, IL

I'm tired of being blinded!!

B.1827 December 1, 2021 — Roslindale, MA

These blinding lights are dangerous. I've been blinded by them on the highway driving home from work.

B.1828 December 1, 2021 — San Diego, CA

These led lights blind me regularly. Not sure why they are legal.

B.1829 December 1, 2021 — Wichita, KS

These are way to bright for cars ahead and behind...

B.1830 December 2, 2021 — Pittsburgh, PA

Joint Congressional Hearings & DOJ Investigation of Microwave Assaults on U.S. Citizens https://www.change.org/p/joe-biden-president-of-the-united-states-of-america-joint-congressional-hearings-doj-investigation-of-microwave-assaults-on-u-s-citizens

B.1831 December 2, 2021 — Pittsburgh, PA

Joint Congressional Hearings & DOJ Investigation of Microwave Assaults on U.S. Citizens https://www.change.org/p/joe-biden-president-of-the-united-states-of-america-joint-congressional-hearings-doj-investigation-of-microwave-assaults-on-u-s-citizens

B.1833 December 3, 2021 — Bronx, NY

I like to see some changes.

B.1834 December 3, 2021 — United States

I am hardly able to drive at night anymore due to the strong headlights and lack of consideration of others not attempting to turn down their overly bright lights. It has become dangerous for me to drive as I literally cannot see the road in front of me.

B.1835 December 4, 2021 — Islamabad, Pakistan

It makes driving dangerous

B.1836 December 4, 2021 — Jubail, Saudi Arabia

Naheed Azhar

B.1837 December 4, 2021 — Toronto, Canada

Driving at night has started giving me headaches. Earlier I used to wonder what's causing this but over the time I have realized it's the bright lights from oncoming traffic in the new cars. I don't feel this with the occasional cars having old halogen bulb yellow lights. There are many times that I had to look away to protect my eyes. I wonder how many other people are facing this

B.1838 December 5, 2021 — Cincinnati, OH

I have a hard time gauging the distance or speed of an oncoming car with LED lights. Not only because of the way it looks but also they are often blinding. Whenever a large truck with LED headlights is behind me, the lights reflect off of my rearview mirror and are painfully blinding. This creates scary and unsafe situations for myself and others on the road. I can only imagine how awful this is for those with strong astigmatism and light sensitivities

B.1839 December 5, 2021 — Detroit, MI

I've almost been in several accidents involving 12 ft ditches because I'm blinded my trucks and suvs with insanely bright led headlights. Headlights brighter than my high beams ! Absolutely ridiculous this hasn't been handled already !

B.1840 December 6, 2021 — Denver, CO

Sick of it...it's already dangerous enough to drive at night.

B.1841 December 6, 2021 — Hamburg, NY

Its blinding

B.1842 December 6, 2021 — MANCHESTER, OH

Driving at night especially in rain and snow you cannot see when when you approach a vehicle with led bright lights

B.1843 December 6, 2021 — Pontiac, MI

I can't drive at night , specially approaching any curves on the road , if this lights are coming at me I have to slow down completely till they are no longer pointed directly in my eyes

B.1844 December 7, 2021 — Jamestown, NY

These lights are dangerous! You cannot dim them, and they blind other drivers!

B.1845 December 7, 2021 — Salisbury, NC

These lights make it difficult to drive at night, are blinding, and induce migraines and other issues in many people.

B.1846 December 7, 2021 — Terre Haute, IN

They are dangerous and I have to avoid night driving.

B.1847 December 8, 2021 — Miami, FL

I drive alot at night & these new lights are so bright & blinding it's ridiculous how it's even being allowed! Take these lights off the strets so we can see!

B.1848 December 8, 2021 — Milford, CT

These lights are extremely blinding, and also a threat and trigger to my health condition.

B.1849 December 8, 2021 — Monahans, TX

I suffer from chronic Migraine Migraine and night blindness. I have to drive to and from work on very dark roads with these headlights either coming at me or coming up from behind. On very narrow country roads, it's hard to look away and stay safe. It's even worse when it's on a work truck displaying two sets of these lights. Something has to be done about these lights before anyone else dies, and I sure hope that someone isnt me.

B.1850 December 8, 2021 — Orange City, IA

The LED headlights on these new vehicles and semis blind me so I can't see ANYTHING. These ****ing things...I can't even tell if they are on low or high beam they're so bright. If I think someone's halogens are on high beam but they aren't and I flash them, and they flash me back...no big deal. But if that happens with LED headlights and they turn on their high beams in retaliation it's like being forced to look at someone welding without a helmet and my eyes hurt for hours after. Anything that damages your eyes and creates deadly conditions is not a headlight: it is a WEAPON. And that's just what these LED abominations are. And they need to be BANNED. To anyone who says "people who

hate LED headlights need their eyes checked": if you need THAT much blinding light to drive at night, then you need YOUR eyes checked. And to everyone in the government who authorized this, take note. WE ARE COMING FOR YOU.

B.1851 December 8, 2021 — San Diego, CA

I hate excessive glare in eyes on night highways.

B.1852 December 9, 2021 — Malvern, PA

I can't drive safely with these brighter lights behind me and coming toward me

B.1853 December 10, 2021 — Hialeah, FL

I am blinded by theseights

B.1854 December 10, 2021 — Lake City, FL

Not only do these light make your side of the road not visible creating a safety hazard but if you're like me they give you an instant pounding headache. These headlights are a nuisance and should be banned.

B.1855 December 11, 2021 — Kinston, NC

I can't see at night with those blinding lights and it causes me to swerve and lose sight and once I gain my sight back another car comes with bright lights. It's ridiculous. It's dangerous. Something needs to be done. Stop fixing things that don't need to be changed and focus more on things like this!!!

B.1856 December 11, 2021 — Middlefield, OH

I can no longer participate in society because of how sick I get from LEDs. Please join me and the many who's lives have been turned upside down by radiation emitting deathiodes in the fight to bring awareness to the deeply painful and life endangering consequences of the lack of regulation and accountability in the 'lighting' market.

B.1857 December 11, 2021 — Reading, PA

I have nearly died in the car because of blinding headlights. I've swerved off the road, I've been unable to see the road in front of me, I've missed bends in the road and I've nearly hit the car blinding me before.

B.1858 December 12, 2021 — Waterville Valley, NH

Deborah Kenney-Hood

B.1859 December 13, 2021 — Canton, GA

I can barely drive at night anymore. I'm afraid of an accident because I am constantly blinded by LED lights aimed into my vehicle

B.1860 December 13, 2021 — FL, United States

I hate these lights. They hurt my eyes and head so bad.

B.1861 December 13, 2021 — Olathe, KS

I can't even see at night while driving anymore, and I'm only 25! With everything going online nowadays, were stuck staring at screens for hours. Sometimes against our will, with work from home! We can't afford to harm our eyes even further.

B.1862 December 14, 2021 — Huntsville, AL

I'm tired of being blinded with these bright lights! It's painful!

B.1863 December 15, 2021 — Kirkland, WA

Led lighting has its place but not for headlights or streetlights. The rays are harmful.

B.1864 December 16, 2021 — Lacey, WA

These new bright headlights are dangerous and blinding to other drivers.

B.1865 December 17, 2021 — Bridport, ENG, United Kingdom
Becouse these headlights are dangerous

B.1866 December 17, 2021 — Plainsboro, NJ
Driving stately is utmost important and this change can help reduce the accidents

B.1867 December 17, 2021 — ashburn, VA
it's highly dangerous

B.1868 December 18, 2021 — Avondale, LA
bc fuck them im trying to see to drive !!!! fuck u too if you have headlights brighter than the sun☒

B.1869 December 18, 2021 — Chicago, IL
It blinds you when u driving

B.1870 December 18, 2021 — O Fallon, MO
If this saves just one life it's worth it.

B.1871 December 18, 2021 — Portland, OR
In really tired of "driving by feel" everytime a car with a set of these lights passes me by. I'm likely going to crash soon.

B.1872 December 19, 2021 — Crossville, TN
bright led headlights with auto dimmers still to BRIGHT

B.1873 December 20, 2021 — Carlisle, MA
I get blinded by cars with LED lights and LED streetlights. We need help to stop this madness!

B.1874 December 21, 2021 — Gilmer, TX
It's dangerous, when you're blinded by these lights

B.1875 December 21, 2021 — San Diego, CA
It is so distracting and dangerous while driving and having these kinds of headlights blinding you! I have feared for my safety when I could barely even see the guide line to the right of my truck. Before these new LED lights became wide spread, that level of brightness was only used when your brights were on. There is zero reason for lights this bright esp when the majority of people drive in populated areas.

B.1876 December 22, 2021 — Albany, OR
I drive country roads often where conditions can be challenging without blinding bright white lights causing temporary blindness. A lot of the time road lines are faded or nonexistent in foggy, rain or other inclement conditions on windy roads these bright white lights. That have become the standard instead of a exception create a perfect storm for close call situations. I can handle old school standard halogen lights even with their brights, but these new led style lights make it impossible for ANYONE to see and we must not take away vision from our drivers.

B.1877 December 23, 2021 — Houston, TX
These lights are harmful and are going to cause many accidents!

B.1878 December 23, 2021 — Salt Lake City, UT
It's so bad that I get migraines any time I go out at night. It's just not reasonable to expect everyone with sensitive eyes to never drive after dark or in stormy weather. These lights are so bright and disorienting that it can lead to premature vision loss!

B.1879 December 23, 2021 — Toronto, ON, Canada
not only is it harmful to myself and other human road users outside of said vehicle, it is also penetratingly damaging to living creatures, notably insects who are disoriented, and disrupted by the effects; this in the sixth great extinction, in a biodiversity crisis...

B.1880 December 24, 2021 — Palm Springs, CA

This has been an issue for me for years!! My eyes are sensitive, and I also suffer from severe migraines. Bless the person who started this petition, and you've got MY signature!

B.1881 December 27, 2021 — Muskegon, MI

I deliver for a living and these lights are so bright that I have to block them with my hands or pull over and let them pass me. Nobody needs lights and powerful under normal driving conditions.

B.1882 December 28, 2021 — Spokane, WA

my astigmatism blurrs led headlights so they’re the only thing i see

B.1883 December 29, 2021 — Swadlincote, ENG, United Kingdom

Headlights on new cars are a joke

B.1884 December 30, 2021 — Johnstown, PA

I have had to quit my job as an Uber driver because I can no longer see when driving at night. This directly leads to bar patrons deciding to drive themselves because they don't have another option, which also adds to PEOPLE DYING.

B.1885 December 31, 2021 — Middletown, NY

Should be illegal

Comments left in 2022

January 2022

B.1886 January 2, 2022 — Palmdale, CA

I have been blinded!

B.1887 January 5, 2022 — Lee, FL

Alferd Carl Murphy!!!!!!

B.1888 January 5, 2022 — Springfield, VA

My motorcycle's headlight is not distinctive in a sea of bright DRLs, putting me at risk with inattentive drivers.

B.1889 January 6, 2022 — ALLENTOWN, PA

I am only 41 and have been struggling to drive at night for years already because of these headlights. Just last week the driver behind me had lights so bright that the reflected off of the median barrier and light up the interior of my vehicle.

B.1890 January 6, 2022 — Columbiana, OH

Blue lights or light containing more blue lessen a persons night vision. These new lights blind other drivers

B.1891 January 6, 2022 — Red Deer, Canada

I hate LED lights so painful on the eyes

B.1892 January 6, 2022 — Salem, MA

When I drive at night, and there's an oncoming car, I can't see a darned thing until it has gone by me. I try to look at where the road in front of me SHOULD be, and pray that I don't hit anything on the side of the road. It's even worse if I am driving in a regular car (I drive a light duty truck.) I have friends who refuse to drive at night because they are blinded by oncoming halogens. Please, please, just angle them DOWN a bit??? Why do they ALL have to look like highbeams are already on? And when they do switch on their highbeams, then I am white knuckling the steering wheel, slowing way down, because I am almost completely blind until they have gone past me. Please, especially for the shorter amongst us, please stop blinding drivers?? It's incredibly dangerous! It is light someone shining a flashlight directly into your face in the dark - all you can see is blinding light.

B.1893 January 6, 2022 — Salem, MA

We were just talking about this at work yesterday. Extra bright headlights, coupled with people having their high beams on, plus the fact that truck & SUV headlights are at the height of sedan windows, make for some dangerous driving conditions.

B.1894 January 7, 2022 — Houston, TX

I drive my car now with high beams all the time bc it bounces back some of the light and even though I know this is illegal; I have no other alternative.

B.1895 January 8, 2022 — Fort Worth, TX

Because I feel that these headlights are dangerous & deadly. My mom almost got in very bad accident because of these damn lights!! How many more people have to get hurt or lose their lives because of this stupid trend of LED lights. It has to stop !! ☒

B.1896 January 8, 2022 — New Braunfels, TX

I am signing this petition because the high intensity lumens (3000-4000) from LED highlights should be illegal, not the specially-designed glasses that are an alternative solution for driving at night. Once again it is a matter of money and power supported by the stronger lobbyists. I thought it was my imagination, that the headlights today are stronger and brighter than yesteryear. With almost 29,000 people supporting this petition, how is it these lights are still legal. It is clear the powerful lobbyists have a strong government backing and consumer affairs are of no concern. What horrific event is going to ban these LED lights the way, the Amber alert came into play. Why will it take a tragedy for this country to create a statute to ban LED headlights. These lights are blinding, these lights cause migraines, these lights force to look away from the road. And for some, these lights cause people to blackout when they are driving. Seriously, that in itself is enough reason to ban LED headlights. The irony is when the LED headlight driver flashes me when i left my brights on, two words for those drivers and its not Happy Birthday!!! This country is ...

B.1897 January 9, 2022 — CA, United States

Im tired of being blinded at night and scared im going to hit someone or something while blinded! I cant believe these lights ever passed ANY car manufacturers safety inspections☒

B.1898 January 10, 2022 — Burnaby, Canada

The ridiculously bright headlights are SO dangerous. For everyone. Motorists, cyclists, pedestrians. PLEASE DON'T USE THEM PEOPLE.

B.1899 January 10, 2022 — Montverde, FL

Went out last night and on the way home on a narrow road the oncoming Suv's lights were blinding the crap out of me! I had to slow way down. I don't like flashing them but I did! Bas-ard had his hi beams on! Really! Even after lowering his high beams I was still blinded! Pisses me off! According to police data, accident investigators report 'dazzling headlamps' as an influence in 10 fatal crashes, nearly 70 serious accidents and more than 250 other accidents. Some drivers suffer something called 'disability glare'. Studies have shown it can take up to 10 seconds to recover from.

B.1900 January 11, 2022 — Emmett, ID

It's gotten to the point I drive at night only if I must. Jeeps and lifted trucks are the worst

B.1901 January 11, 2022 — Lomita, CA

I remember growing up in the 70's and 80's. Any off road halogen lamps, which are a lot weaker than today's modern cars' lights, being used on the road would la d you a ticket. Today corruption is evident, the motor vehicle departments and the legislature as well as the transportation department has given in to manufacturers, for profit, and prove of it is that these blinding lights are no longer considered ilegal. Enforcement against these lights is not possible because corrupted officials have turned these blinding lights "legal". Third world business in the USA of today !

B.1902 January 11, 2022 — Red Deer, Canada

I am all for banning LED's on headlights. They belong in an operating room not on the road. I really hope more people start opposing these lights as more and more are going to be seen on the road in

the next 2 years. It′s going to come to a point where you will feel like you are in the twilight zone just going for a drive! PLEASE BAN LED′S OR REGULATE THEM SO THEY ARE NOT WHITE BRIGHT AND HARD ON THE EYES! I′m not old but it′s going to become an issue for those in their 20s and 30′s eyesight will be destroyed!

B.1903 January 12, 2022 — Pompano Beach, FL

This light are hazardous and blinding

B.1904 January 13, 2022 — Columbus, OH

The intensity of the led headlights is beyond all possible reasoning. I′m 46 with no health issues and drive with 1 hand over my face for oncoming traffic. A ridiculously tall pickup that has no use other than to feed egos had 6 lights on each side of the grill, and were at least 5 feet above the ground. Additionally, a behemoth truck passed me and the lights shone sideways as well and blinded me as it was passing me. How did this pass government safety regulations.? Guess the auto lobbyist bought a few more politicians. Where is the justification in for this level of lighting? It is equally bad when one of these giants pulls up behind you at a stop light. Once again, I guess we haven′t reached the number of led light related deaths to change anything. The only people supporting these lights are the ones who drive them.

B.1905 January 15, 2022 — New Orleans, LA

Bring back yellow lights ��

B.1906 January 16, 2022 — Freeport, MI

LED headlights are way too bright and they′re dangerous. Whenever a car with LED headlights is driving past me, I can′t see anything until they′re gone, and I have 20/20 vision. Please ban LED headlights for the sake of road safety.

B.1907 January 16, 2022 — Miami, FL

I′ve been temporarily blinded by these ridiculous lights. They are dangerous to safe driving!

B.1908 January 17, 2022 — Rochdale, ENG, United Kingdom

These headlights are unnecessarily dangerous and potentially lethal.

B.1909 January 18, 2022 — Jacksonville, NC

I can’t for the life of me understand how these extremely blinding bright headlights are legal. It’s frustrating driving at night because of those headlights!!

B.1910 January 19, 2022 — Hornsea, ENG, United Kingdom

The LED headlights blind oncoming drivers. They should be banned outright.

B.1911 January 19, 2022 — Manchester, ENG, United Kingdom

The new LED headlights are too bright and very dangerous, particularly for those who suffer with photophobia migraine and other similar conditions. These new lights are not a move in a positive direction, they are a set back.

B.1912 January 19, 2022 — Totnes, ENG, United Kingdom

Since the introduction of LED lights I am noticing getting ′blinded′ at times by the brightness glare causing much difficulty for me driving at night.

B.1913 January 19, 2022 — Totnes, ENG, United Kingdom

LED Car lights are a irritation and dangerous... they are unnecessarily bright causing temporary blindness to people with sensitive eyes when driving at night.

B.1914 January 20, 2022 — Buckfastleigh, ENG, United Kingdom

I find driving at night very dangerous because the headlights are blinding

B.1915 January 20, 2022 — Columbus, OH

They′re blinding to other drivers on the road

B.1916 January 20, 2022 — Columbus, OH

Tired of blinding lights

B.1917 January 20, 2022 — Salt Lake City, UT

I fully agree. LED headlights are unsafe and need to be regulated.

B.1918 January 21, 2022 — Blackpool, ENG, United Kingdom

I have Irlen's Syndrome and walking in the dark is horrendous because of these lights, worse when I am driving in low light! They because me significant pain

B.1919 January 21, 2022 — New Fairfield, CT

We live in rural area and these lights are incredibly dangerous.

B.1920 January 22, 2022 — Ashford, ENG, United Kingdom

It's ridiculous they're legal

B.1921 January 22, 2022 — Denver, CO

Some people have astigmatism or blue eyes and there are no regulations on how bright LED headlights can be they are dangerous not to mention painful.

B.1922 January 22, 2022 — Lethbridge, Canada

No where in nature do you see lights this intense and blinding. It's un-natural and harmful. Time to reclaim the night and start living in harmony with nature.

B.1923 January 22, 2022 — Lethbridge, Canada

No where in nature do you see lights of this intensity and brightness. The whiteness and glare is harmful on all levels to people and the environment. Best way to send a message to manufactures who churn out this crap is to simply NOT buy it.

B.1924 January 23, 2022 — Montgomery, AL

LED lights can cause seizures in people with epileptic photosensitivity.

B.1925 January 23, 2022 — Philadelphia, PA

https://www.ama-assn.org/press-center/press-releases/ama-adopts-guidance-reduce-harm-high-intensity-street-lights

B.1926 January 24, 2022 — Columbia, CT

These auto lights are causing much distress to my eyes during daytime but especially at night and I know I'm not the only one. Something must be done to stop this agenda to blind American citizens.

B.1927 January 24, 2022 — East Prospect, PA

They are blinding!!! I hate them!!

B.1928 January 24, 2022 — Hastings, United States

I know very many people, including myself, that fear driving at night because of these lights. It's unsafe and unnecessary.

B.1929 January 24, 2022 — Wakefield, United Kingdom

Agree with the cause being fought here. LED lights are particularly glaring - its the directional intensity, colour temperature (if only they were at the very least a 'warmer' colour), they often have high-frequency but discernible flicker, and auto-headlight sensors in cars bring them on too early, heightening the glare at dawn/dusk when dimmer sidelights are more appropriate.

B.1930 January 24, 2022 — Washington, FL

Because led headlights have blinded me during nighttime driving therefore I cannot drive at night.

B.1931 January 25, 2022 — Oakland, MD

We need regulation on headlight luminosity.

B.1932 January 25, 2022 — United Kingdom

I have lost my confidence in my abiy to drive at night because of this and so avoid going out at night.

B.1933 January 25, 2022 — Worcester, United Kingdom

I know first hand the effects this has on my health and how it has made my life so restricted both indoors and out . People need to know the effects it has on photosensitive people and in fact non photosensitive too. The impact on health is phenomenal and it needs to be better understood & circulated to all and significant action taken to address this issue .

B.1934 January 25, 2022 — glasgow, SCT, United Kingdom

Blinding brights lights at night are a nightmare you think it's full beam that's on accident waiting to happen

B.1935 January 26, 2022 — London, ENG, United Kingdom

I struggle to drive at night with bright lights like this and almost had an accident. I had my eyes tested and they are fine, it's purely people with lights too bright

B.1936 January 26, 2022 — Saxmundham, ENG, United Kingdom

I work in lighting industry and I know the effects of blue light and think this should be addressed globally.

B.1937 January 28, 2022 — Jacksonville, NC

I absolutely cannot believe that these lights are legal! Everything about driving a car should be about safety, seat belts, air bags, etc but it’s okay to have blinding lights on your car?!?! This is reckless and inexcusable and needs to stop now!!

B.1938 January 29, 2022 — Banbury, ENG, United Kingdom

You think they are on main beam when they are on dip, you cannot help but look straight at them. So sad they have been allowed to become so common and the new "norm".

B.1939 January 29, 2022 — UT, United States

If we're having issues now and nothing is being done, it's only a matter of time before car manufacturers start increasing lumen levels in their headlights making the problem worse.

B.1940 January 30, 2022 — Elgin, IL

I drive daily. And I see people using LED light bars as headlights. Even during the day. And the light is beyond absurd and blinding.

B.1941 January 31, 2022 — Chicago, IL

Sadly, we've all seen how some people act when "it's for the good of others or the environment"... My question is when did BRIGHT lights like these become LEGAL?! I remember getting PULLED OVER & TICKETED 20yrs ago (in a mid-90s car) for having my "brights" on since 1 of my headlights was out. As DIM as those lights were, the Officer said I blinded him when I turned behind him! Now, 20X BRIGHTER IS OK?!! Like most nonsensical things, it's probably going to take someone "IMPORTANT" to get hurt because of it for anything to change...

B.1942 January 31, 2022 — Chipley, FL

These light should be banned they are blinding when you meet them head on. The glare and blinding is so dangerous While driving.

B.1943 January 31, 2022 — Pendleton, SC

These lights are blinding and dangerous. Impossible not to squint when someone has these lights coming towards you. How in the heck is that safer than the other less bright lights???

B.1944 January 31, 2022 — Westlake, OH

I can't see anymore driving at night!!

B.1945 January 31, 2022 — lawrenceburg, IN

LED head lights are blinding and very dangerous. Especially at night in the rain when you can't see the lines on the road or anything in front of you because you're blinded by LED head lights.

February 2022

B.1946 February 1, 2022 — Chipley, FL

These type lights are blinding. And I can't see good at night already.

B.1947 February 1, 2022 — Huntington Beach, CA

We're in Southern California where there's streetlights every 15 feet. You don't need these here, and we NEED to be able to see in front of us instead of using both hands to block the rear and side view mirrors when you're behind us. In backwoods Oklahoma, fine, it's dark. But we're in a very well lit part of the country. Stop it. You suck.

B.1948 February 1, 2022 — Milliken, CO

I drive in the dark in the morning a good part of the year. Usually these ultra-bright lights are on lifted pickup trucks, which is a double-whammy. It's too much and needs to change.

B.1949 February 1, 2022 — United States

Th se headlights are dangerous. They should definitely be banned.

B.1950 February 2, 2022 — Cameron, MO

hate being blinded by headlights

B.1951 February 4, 2022 — Olympia, WA

I am a professional driver and the harsh white light makes working dangerous and hard to see while driving at night.

B.1952 February 5, 2022 — Cullman, AL

These lights are dangeroys

B.1953 February 5, 2022 — Lynn, MA

They blind me when driving not safe at all

B.1954 February 5, 2022 — Lynn, MA

I wholeheartedly agree. It's dangerous! When they are coming toward me in a narrow dark road at night, some headlights are so blinding and I have to hope for the best until the other vehicle passes. When they are directly behind me, I have to fold my rearview mirror up (which is dangerous in and of itself, but still less so than not doing it) so that I can see on front of me and that only helps so much, since the glare from them are still blinding me from my sideview mirror. I don't understand why this has been allowed to become such an issue, in the first place. I hope this will save some lives.

B.1955 February 5, 2022 — Melrose, MA

Sometimes I am blinded by these headlights

B.1956 February 6, 2022 — Rostov-na-donu, Russia

Can not drive at peace anymore. Especially now, in the winter, when the glare is ever more prominent. And the worst thing is - since most cars come equipped with DRLs nowadays and it's considered "more safe" - makes my life even more miserable. Obviously, my issue won't get fixed by any sorta legislation in US. But it's a start. P.S. Did you know that in France it was illegal to have any manner of white lights until 1993 and you had to use "selective yellow" headlights?

B.1957 February 7, 2022 — Dearborn, MI

Europe already has these laws and it saves lives. We can do better in the United States. Trucks and large SUVs are the major culprits to this.

B.1958 February 7, 2022 — Toronto, Canada

It seriously is causing me harm. I drive on single lane highways often throughout Ontario and I am fearing for my life because of oncoming and even traffic following me. I cannot see, it is basically a guessing game with me praying that I do not fly off the roadway into a ditch. Blinding is an understatement.

B.1959 February 9, 2022 — Pittsburgh, PA

It's hard to see in front of you when you're blinded

B.1960 February 9, 2022 — San Antonio, TX

I get blinded by them and can't see where I'm going.

B.1961 February 9, 2022 — Stratford, Canada

I have experienced dangerous driving conditions due to LED lights

B.1962 February 11, 2022 — Palm Bay, FL

Karen Stillings

B.1963 February 14, 2022 — Franklinton, NC

As someone with an astigmatism in both eyes, these lights are quite blinding. I have driving glasses that don't even work with the LED and HID lights.

B.1964 February 15, 2022 — Belsize Park, United Kingdom

They are a danger to other road users as they are too bright and could easily cause a accident due to dazzling

B.1965 February 15, 2022 — Laramie, WY

These lights are great for seeing....if you're the one driving with them. For everyone who has to drive with these lights shining in their face, it can cause or worsen a migraine and/ or it makes everything other then the lights look black! Therefore it temporarily blinds the driver from the road ahead....

B.1966 February 15, 2022 — United Kingdom

For a long time now people have been driving with LED lights that despite the dipped position are still glaring drivers on the road. I am a learner driver and spend most of my time as a passenger in my partner and my friends car and the glare from oncoming LED lights is unbearable. Several times when I have been in the car with other people they have had to slam on the brakes because they are dazzled by oncoming LED headlights. They should be made illegal unless the bulbs or headlight casings can be tinted a pale yellow colour to reduce glare and help all road users to become safer drivers.

B.1967 February 16, 2022 — Conklin, NY

No one needs these headlights on he automobile. They are blinding.

B.1968 February 17, 2022 — Denver, CO

I am tired of being blinded by HID and LED car lights, even in day time, but especially the night time. Furthermore, The American Medical Association stated they find that increased levels of LED and blue light can cause blurriness, migraines, sleep apnea, heart disease, even cancers.

B.1969 February 17, 2022 — United States

I encountered a car today that was a pair of blinding suns moving towards me DURING DAYLIGHT. I had no idea what kind of vehicle was behind the light until it passed me, because I couldn't see anything else on the road at all. I expected something unusual, like a rescue vehicle. Nope, just an ordinary car. That can't be legal.

B.1970 February 18, 2022 — Kirkland, WA

I hate being blinded by stupid LED headlights. I have to drive a lot at night working Door Dash. We are all going to be blind in a couple of years!

B.1971 February 19, 2022 — Crewe, United Kingdom
It's so dangerous to blind someone that's driving.

B.1972 February 19, 2022 — Endicott, NY
I have good eyesight, but find the blue-white LED headlights to be occasionally blinding at night.

B.1973 February 19, 2022 — Manchester, ENG, United Kingdom
I have been blinded far too many times by these lights and have had many near misses! In the dark they dazzle you, and then you can't see properly for minutes after

B.1974 February 20, 2022 — sarasota,, FL
I have been blinded by these kinds of lights many times.

B.1975 February 21, 2022 — Hialeah, FL
Ultra-white-high-intensity lights are risk for drivers.

B.1976 February 21, 2022 — SAN ANTONIO, TX
BAN BLINDING LIGHTS.

B.1977 February 23, 2022 — Amherst, MA
I'm tired of being blinded by oncoming headlights!

B.1978 February 23, 2022 — Bangor, WLS, United Kingdom
These lights are blinding and make driving in the dark very difficult!

B.1979 February 23, 2022 — Baytown, TX
I'm tired of getting blinded by assholes when I'm driving at night

B.1980 February 23, 2022 — CA, United States
I have to pull over every time someone with led headlights comes towards me. If I look at their lights. I'm blinded for several minutes

B.1981 February 23, 2022 — Cheyenne, WY
I'm tired of being blinded

B.1982 February 23, 2022 — Gorebridge, SCT, United Kingdom
They are a danger to on coming traffic

B.1983 February 23, 2022 — Manchester, ENG, United Kingdom
Some headlights are absolutely ridiculous and certainly not required in an urban environment. This is made worse by some people who park facing oncoming traffic with their headlights full on.

B.1984 February 23, 2022 — Sugar Land, TX
I totally agree with this petition. I done like driving at night for this reason! It is so dangerous for these lights to be used as headlights.

B.1985 February 24, 2022 — Glasgow, SCT, United Kingdom
I'm no longer comfortable driving at night

B.1986 February 24, 2022 — Medford, OR
I have an astigmatism and these LED headlights make driving dangerous and nearly impossible.

B.1987 February 24, 2022 — Needham, MA
I am concerned

B.1988 February 24, 2022 — brooklyn, NY
Lights blind other drivers and cause deaths and accidents

March 2022

B.1989 March 2, 2022 — Austin, TX

These lights are blinding for those in on coming traffic, particularly on country roads where city lights do not balance their effect. Traditional car lights are just as effective for driver's visibility.

B.1990 March 2, 2022 — Fort Lauderdale, FL

This shit is ridiculous now. Enough is enough. Brighter lights help the driver behind them and then temporarily blind the oncoming drivers. This is NOT a safer enhancement!

B.1991 March 4, 2022 — Maple Ridge, Canada

I'd like to live another few years!

B.1992 March 5, 2022 — Bothell, WA

I'm 26 and can barely drive at night due to the sheer amount of cars with these lights. They blind me from my rear and side mirrors unless I hunch over the steering wheel, which is incredibly dangerous. I am also autistic and suffer from migraines so even a drive around the block is a guaranteed pain attack unless I pull over but even then I can't avoid the oncoming brights. These lights have even stunned me DURING DAYTIME! It's ridiculous that car manufactures think bright blue is better. It hurts! Please change the law and ask manufacturers to do light recalls!!! How can I hold down a job safely if I can't drive at dawn or after dark? It's beyond my control.

B.1993 March 5, 2022 — Brooklyn, NY

I hate LED lights. Bring back amber and sodium vapor.

B.1994 March 5, 2022 — Louisville, TN

Yesterday I looked in rear view and a new trucks light was so bright I was coming to a light n couldn't see ,I stopped in the middle of the road ,at a green light ,and almost got rear ended

B.1995 March 5, 2022 — Lower Burrell, PA

I am tired of being blinded by on coming bright headlights.

B.1996 March 5, 2022 — Mason, TX

These lights are a hazard to oncoming traffics ability to see while passing the person with these lights.

B.1997 March 6, 2022 — London, ENG, United Kingdom

They are fitted to appeal to the feeble minded who think they look 'cool', car manufacturers are more interested in sales than road safety

B.1998 March 7, 2022 — Leicester, United Kingdom

The breed of today's headlights especially those decorative and blue filament types dazzle and should be banned.

B.1999 March 8, 2022 — La Mirada, CA

I live in a southern CA mountain/lake resort town with very challenging road conditions. Many people from out of the area use their high intensity lights indiscriminately. This causes many accidents with people being blinded and forced off the road as well as causing a lot of wildlife accidents/fatalities. It isn't safe - let's fix it.

B.2000 March 10, 2022 — South Petherton, ENG, United Kingdom

Blinding people indicators need to be more visible not blended into break lights

B.2001 March 11, 2022 — Saint George, UT

Helen Wilson

B.2002 March 13, 2022 — Gallatin, TN

I genuinely cannot see at night due to these lights. I've caught myself in the other lane or on the side of the road because these lights blinded my vision to the point I could not see the lane lines. I have chronic migraines and any time I drive at night these induce them without fail.

B.2003 March 14, 2022 — Statesville, NC

I am so tired of being blinded by lights on vehicles! I cannot change my eyeballs, but people can certainly change their lights!

B.2004 March 16, 2022 — Peoria, AZ

I'm signing because my family friend was a severe car accident that left her hospitalized from a 6 months due to being blinded by an LED headlight and swerving off the road

B.2005 March 17, 2022 — Penzance, ENG, United Kingdom

I struggle to dive at night, avoid it as much as possible because of these blinding lights.

B.2006 March 17, 2022 — Swansea, United Kingdom

all the 5g smart grid is a slow kill technology.

B.2007 March 18, 2022 — Akron, OH

I am signing this petition because these led headlights are dangerous and can cause vision complications. I have personally experience these led headlights are blinding me at a stop light and driving on the road. It is not safe for anyone and will cause unfortunate accidents.

B.2008 March 20, 2022 — burnaby, Canada

Something needs to be done about this. It's terrible and dangerous

B.2009 March 21, 2022 — Wynne, AR

I drive approximately 1.5 hours to work in the dark and back home daily. I am so sick of being blinded by these bright headlights. I just close my eyes and keep rolling when I pass them. I go in everyday thinking this will be the day they get me. It's insane. Nobody needs headlights that bright!!

B.2010 March 23, 2022 — Corvallis, OR

Driving is a part of daily life for many Americans, and widespread adoption of LED in headlights has had a noted effect on my life. If this is true for me, it must be for millions of others.

B.2011 March 23, 2022 — sterling heights, MI

I already have awful astigmatism making night driving awful already... These headlights have made it A WHOLE LOT WORSE. They need to be banned/outlawed immediately!!!

B.2012 March 24, 2022 — Halifax, Canada

Well a win for us today! GM and Ford are recalling some vehicles that have headlights too bright! Also shows the Transportation Safety Board are useless! https://abcnews.go.com/US/wireStory/general-motors-recalls-740k-suvs-headlights-bright-83598621

B.2013 March 24, 2022 — Mount Pocono, PA

Also ban the use of LED emergency lights that blind motorists, and ironically makes the 'Move Over' law hazardous to comply with.

B.2014 March 27, 2022 — Norfolk, VA

The LED headlights are blinding

B.2015 March 28, 2022 — Rochester, MN

When that car drives towards me with led lights, I Can't See the road car etc. Led lights are dangerous for incoming traffic!!!

B.2016 March 29, 2022 — Bloomington, CA

The LED lights give me headaches and make night driving unsafe bc I can't see curbs or islands. I try not to drive at night, but have resorted to wearing sunglasses at night if I must drive.

B.2017 March 29, 2022 — Buffalo, NY

I'm tired of having to move my mirrors because of some jerk off behind me blinding me

April 2022

B.2018 April 4, 2022 — Toms River, NJ

I'm only 38. I shouldn't have to to consider not driving at night. But every night I drive home from work im blinded and the cops do nothing to help. They watch you drive by with your car lite like it's the middle of the day and do nothing. Till something is changed im driving 15-20 mph if they get behind me.

B.2019 April 12, 2022 — Lahaina, HI

Lights are so obnoxiously bright. I get blinded by low beams from the back, shining in my rearview mirror. Lights should be the lowest level necessary for safety, not a security light that lights up the road for miles.

B.2020 April 16, 2022 — Los Angeles, CA

These blinding headlights have gotten out of hand and should go away for good. There is absolutely no reason why vehicles such as pickup trucks and semi trucks need to have blinding headlights which are brighter than a car's high beams. These lights are very unsafe for oncoming and outgoing traffic, especially during heavy rain storms at night.

B.2021 April 18, 2022 — Roxbury, MA

It is bewildering that someone decided these glaring, painful lights were a good idea anywhere. They give more light, but there is less visibility, due to glare. More bewildering is that they got manufactures and a big chunk of the population to go along with it. However, using them for headlights is just… what word is strong enough for "so obviously foolish; surely they could have predicted what would happen." If they can make these lights with a more tolerable color spectrum (as they do with fluorescent lights), why don't they? They hurt my eyes and blind me if I'm caught unprepared. For self preservation I look at the line at the edge of the road, and not directly at the road. I assume others do the same.

B.2022 April 19, 2022 — Australia

These are a danger to all road users. If they cannot be correctly installed an angled by the manufacturer in the first place, ban them altogether.

B.2023 April 19, 2022 — Bay City, MI

I am affected while driving when others have super bright led headlights. It blinds me to the point that I can't see the lines on the road and have to shield my eyes.

B.2024 April 19, 2022 — Chattanooga, TN

These lights aren't just blinding they're painful; daggers stabbing into my eyes. It's gotten so bad I have to wear sunglasses at night to protect my eyes.

B.2025 April 20, 2022 — Waxhaw, NC

I'm blinded by oncoming headlights!

B.2026 April 21, 2022 — Farmington, CT

To be accurate. LED = light emitting diode. JUST Like a Laser Diode. LED "lights" are NOT LIGHTS! But dirty unfocused, un-natural LASERS! They have NO PLACE on vehicles!!

B.2027 April 21, 2022 — Hull, ENG, United Kingdom

I darent drive at night becayse of the blinding lights. I cant see a thing.

B.2028 April 24, 2022 — Takoma Park, MD

These LED lights might actually brighten a road, but their excruciating glare causes oncoming drivers to both miss markings (and signs) and to have to look completely away from a road. Installing useful lights—head or tail—that are actually possible to look at should not be even slightly difficult to manage.

B.2029 April 25, 2022 — Leonardtown, MD

I'm sick of being blinded by super bright headlights while driving at night. You can tell from a mile away which car has reasonable headlights, and which one has the newer super bright blinding headlights that are going to daze you when it passes. It's gotten ridiculous now, and NHTSA should have done something long ago.

B.2030 April 25, 2022 — Memphis, TN

The saying is to look at the painted guide line on the passenger side. However, that doesn't work for oncoming vehicles. Also, from the rear it makes you do not want to look at your dude view mirror. I can flip my rearview mirror. However, my side view mirrors didn't come with the feature of mirrors being able to reduce glare and brightness. It's not just the LEDs. It's also people with these yellow/haze oxidized headlights with high beams on. Like there's self DIY restoration kits and also pros that's restores headlights clarity.

B.2031 April 26, 2022 — Durham, NC

this has been driving me crazy and the lights are damaging my family's eyes and affecting our sleep

May 2022

B.2032 May 4, 2022 — Australia

These lights are ridiculous! Driving back home from Airlie beach yesterday so many people not only blinded me with their lights on low beam but they seem to not see you coming either. I had to flash at least 8 cars just to get them to dim their lights. You are left with light burn in your eyes for a few seconds that is so dangerous! I cannot believe it is legal.

B.2033 May 6, 2022 — Mauldin, SC

I have a very low car and they shine right into my window I can’t see anything until I pass them! I know I can’t be the only one who gets blinded.

B.2034 May 15, 2022 — Charleston, WV

My aunt has almost wrecked because

B.2035 May 18, 2022 — Laconia, NH

The blinding lights cause me migraines. I won’t drive at night now. They need to be stopped

B.2036 May 19, 2022 — Mount Laurel, NJ

I’m signing because these lights are horrible!! The LED ones (super bright white ones)... They are absolutely blinding!! Whether they are shining from the car in back of you or cars that are facing you... “They are a blinding” and I can’t see how people are able to bare them? I use a my rear few mirror dimmer to help me with cars behind me, but I literally have to hold my hand up like I’m blocking sun glare for the cars that are driving towards me. They are really hazardous. I was literally blinded by a car driving towards me with them one day and I had to pull over and let it pass because I couldn’t see! They shouldn’t be legal at all. This isn’t safe! They are too bright and there will be more fatalities if something isn’t done. I’m so happy to see this petition. After yet another blinding experience this evening I had to look for help! Hopefully it won’t take a horrible event for something to be done.

B.2037 May 20, 2022 — belleville, MI

I can't stand halogen headlights and they're dangerous

B.2038 May 26, 2022 — United States

I hate these headlights, I can't see!

June 2022

B.2039 June 9, 2022 — Philadelphia, PA

i get constant migraine and i think its from driving at night, these LEDs arent it. ive been blinded to the point that im almost driving towards the light which can cause friggin accident

B.2040 June 9, 2022 — Wynnum, Australia

The over last 10 years have become far to bright.

B.2041 June 24, 2022 — Toledo, OH

They are to bright.

B.2042 June 26, 2022 — Tempe, AZ

Yes I understand it because, certain newer cars have a tendency to blind you, it can be very very dangerous.

B.2043 June 30, 2022 — Covington, LA

I get "Blinded By The Lights"

July 2022

B.2044 July 2, 2022 — Detroit, MI

driving with double astigmatism at night was hard enough before these headlights. even in my 20s, i've almost completely given up driving at night due to these too bright headlights.

B.2045 July 10, 2022 — Brooklyn, NY

Clean headlights should be suffice. You're not directing ships to port. Your stock headlights are enough.

B.2046 July 10, 2022 — Milwaukee, WI

These lights are unsafe and need to be banned. When I walk at night I can't see a thing with these oncoming headlights.

B.2047 July 21, 2022 — Springfield, IL

These headlights are actually dangerous. If you need that much light to drive at night you shouldn't be driving.

B.2048 July 22, 2022 — Montreal, Canada

these lights are evil and they suck improve road lighting fixtures instead

B.2049 July 22, 2022 — Pembroke, Canada

As a migraine sufferer with light sensitivity, these headlights make it very difficult to drive at night.

B.2050 July 22, 2022 — Vacaville, CA

I hate those headlights with a passion

B.2051 July 27, 2022 — Toronto, Canada

The street lights have gone dimmer and car lights are so bright they literally blind you for seconds after they pass you.

B.2052 July 28, 2022 — Haverhill, MA

These lights are completely unnecessary & DANGEROUS! The human eye is not meant to constantly dilate & be flooded with blinding light one second, and then plunged into darkness the next. Your eyes cannot physically possibly adjust that fast! If someone blinds you with these horrible led headlights and then someone crosses the street in front of you in the dark, you could possibly hit them! It is insane! They give me headaches and eye aches. LED headlights WILL kill people. In fact, they probably already have

August 2022

B.2053 August 5, 2022 — Aurora, CO

I'm tired of being blinded from this style of headlights. It is dangerous to have these headlights on vehicles.

B.2054 August 8, 2022 — Corapeake, NC

LED are just dangerous. Even during the day they blind me and I'm only 47. How bad do they blind older drivers?????

B.2055 August 9, 2022 — mission viejo, CA

LED cause migraines

B.2056 August 11, 2022 — Montclair, NJ

I get blinded if driving at night and a vehicle with LED lights is coming towards me. It is incredibly dangerous. The old-style car lights never bothered me unless they'd left their high beams on.

B.2057 August 11, 2022 — Wallington, NJ

These headlights are blinding from oncoming vehicles and from the vehicles behind. The mirrors drill them into the driver's eyes.

B.2058 August 12, 2022 — La Center, WA

I've been literally temporarily blinded for a few years from extreme white and blue spectrum headlights.

B.2059 August 15, 2022 — Santa Monica, CA

This is a horrible traffic hazard --- exponentially worse when used on higher-profile vehicles like SUVs and large pickups. But even with regularly-sized cars, it's made it so that I can hardly see the road ahead, whether it's someone coming astride in the other lane, or oncoming traffic. I don't see a single benefit here. I'm not sure why these are necessary -- for safety?

B.2060 August 17, 2022 — brookline, MA

these bright lights make driving at night VERY difficult.

B.2061 August 18, 2022 — Santa Cruz, CA

These super bright HID lights that are put into reflector housing are putting out a super blast of light that is like driving directly into the sun! The purpose of these types of lights are to hopefully cause an accident in the hopes of killing a targeted person. These headlights are currently being used by hate groups, gangs, police, and by political groups who just can't think for themselves and believe the rhetoric and must go out and force their ideology and everyone else. These super bright, completely blinding headlights are being used as one of the newest killing weapons. I have personal experience with this new murder tool as it is currently being used against me as I am the current target of a local hate group which is backed by several home owner associations. My crime, I am a 63 year old disabled widow living with my dog in my van. This vigilante group has been running homeless people out of my county for a couple of years now or simply being homeless. I on the other hand and quite stubborn and will not be run out of the place I grew up in and been in for 60 years. These are some of the tactics that these groups are using in a negative way not just to brighten up the highways but to try to slaughter some of our citizens purposely. The kicker to this story is that the local police and Sheriff support and allow this actions against individuals. They have done absolutely nothing to stop this vigilante group from using these headlights against their targets. These HEADLIGHTS ARE THE NEWEST REVOLVERS! PLEASE BAN THEM!

B.2062 August 19, 2022 — Brookfield, IL

These lights seriously are blinding, they have affected my night vision. Cars are equipped with bright lights when needed. Please go back to the regular headlights.

B.2063 August 19, 2022 — Fresno, CA

Too many people swap out ther bulbs for these super bright LEDs and aiming them high. I've been blinded too many times from on coming traffic with these LEDs and have have to change my rear view mirror and side mirrors when they are behind me because its so blinding. These lights need to be illegal. Cops and highway patrol need to pull them over.

B.2064 August 23, 2022 — Glen Head, NY

Being constantly blinded by ridiculously bright headlights while driving at night is a completely solvable issue and its ridiculous that nothing has been done to address this ever-growing problem.

B.2065 August 30, 2022 — Simpsonville, SC

There's no reason for the lights to be as bright as they are. Eyes can't adjust that quickly which means that for a few seconds drivers are literally driving blind.

September 2022

B.2066 September 2, 2022 — Denver, CO

I'm sick of being blinded by these headlights their practically high beams

B.2067 September 8, 2022 — Jackson, TN

The car and truck lights are blinding and could cause an accident.

B.2068 September 8, 2022 — United States

When I'm driving at night these headlights makes difficult for me to see the cars approaching me and the Road.

B.2069 September 12, 2022 — Midland, MI

These lights are killing people

B.2070 September 12, 2022 — Nelson, New Zealand

It is very blinding driving at night and a car with these types of lights comes towards you.

B.2071 September 12, 2022 — Tumbler Ridge, Canada

LEDs are a health hazard and dangerous to drivers. They need to go ASAP.

B.2072 September 14, 2022 — Blacktown, Australia

They are genuinely dangerous to the safety of others

B.2073 September 17, 2022 — Kansas City, MO

I hate those horrible blue lights they make it SO hard to see! This is the whole reason I hate driving at night!!

B.2074 September 18, 2022 — Ankara, Türkiye

ڈیو

B.2075 September 18, 2022 — Lake ozark, MO

I'm a collision survivor

B.2076 September 20, 2022 — Granada Hills, CA

I have a condition called Adies Tonic pupil which causes for one eye to be dilated. Even with special prescription glasses to drive at night, I'm still blinded by these lights because they are so bright. These new lights need to be regulated NOW! For the safety of all pedestrians and drivers.

B.2077 September 22, 2022 — Atlanta, GA

Highly distracting, lives matter more than aesthetics. Especially on a night drive.

B.2078 September 23, 2022 — Maynardville, TN

The United States is lacking in headlight control. Other countries, such as Europe, allow for ADB headlights. United States laws do not allow for the use of these adaptive headlights. Manufacturers are fitting new vehicles with these dangerously bright LED headlights, but using old methods of simply blocking off the light or angling it down to reduce glare. This works ok when on a flat road, when the headlights are properly adjusted, and the vehicle is not modified. We all know the world is not flat though, and modifying vehicles is a strong hobby. This leaves other drivers on the road blinded by oncoming vehicles simply by cresting a hill. Trucks can be towing a small load, causing the rear to squat, and angling the headlights upwards, making it seem like they are driving with their

high rams on. It's a fairly simple solution, change the laws to allow for the ADB system to be used in the United States, and outlaw the use of LED headlights without being paired with an ADB system. We need to move quickly as this is already way out of hand with manufacturers.

B.2079 September 26, 2022 — Connecticut, CT

These lights are dangerous and unnecessary.

B.2080 September 27, 2022 — Queens, NY

As someone who gets migraines from bright lights (as many people do), the bright headlights make driving at night impossible and dangerous.

B.2081 September 29, 2022 — Montreal, Canada

I can't drive at night because of HIDs. They are unsafe!

B.2082 September 29, 2022 — Shah Alam, Malaysia

Those who use blinding headlights on their vehicles are scumbags of society who are irresponsible and extremely selfish to the core, show zero respect to lives.they should be dealt severely by law of the country. Expect authority to take stern action ASAP before the innocent road users are killed by them.

B.2083 September 29, 2022 — Yakima, WA

Please for the love of God make this blinding lights illegal. A huge truck parked in front of us last night while we were pulling out of target and I am still seeing weird spots the next day. It makes me so sad honestly. Our vision is one of the most precious gifts. We are killing it with this stupid bright headlights

B.2084 September 30, 2022 — Halifax, Canada

Can we please stop this madness! At least stop putting LED lights in high trucks and jeeps which negates the cutoff shield. Please!!

October 2022

B.2085 October 1, 2022 — Minneapolis, United States

I've almost gotten into several accidents being blinded by led headlights behind me, they need to put limitations on how bright and what color they are

B.2086 October 7, 2022 — Orange City, IA

LED headlights aren't just inanimate objects. They represent a group of CRIMINALS who have unleashed an eyesight and life destroying pandemic upon drivers. Normally criminals are forced to pay for their crimes. But these criminals have been committing their crimes with absolute impunity and no repercussions. These criminals include: Ann Carlson and the rest at the NHTSA, the DOT, State DOT's, the FDA, elected officials, and local law enforcement who despite mountains of evidence that LED headlights destroy eyesight and endanger lives have refused to lift a finger to do anything to regulate this atrocity or even take legal action against those violating the law by putting illegal aftermarket LED's in semi trucks and vehicles. LED headlights have RUINED my life. They have damaged my eyesight. They have taken away my job of ten years. They have taken away my ability to make a living and pay my mortgage and bills. They have ROBBED ME of my ability to go out at night and drive when and where I want. They have DESTROYED my social life. They have DESTROYED my ability to see friends and visit family. They have DESTROYED my ability to date and chances of finding a spouse. LED headlights have at 47 years old forced me to become a recluse in my own home. And even there I am not safe. I can't even sit outside and enjoy my yard because of cars driving by blasting their LED headlights across my property, or my neighbors on both sides of the streets parking their cars facing my place and leaving them running with their cursed LED headlights shining my way. I can't even look up while mowing along the streets for fear of being blasted by those devil lights. All of this has gone on for so long, and taken such a toll on me that I am now to the point that daily I consider taking my own life. Just a few years ago my life was normal and happy. But all that has been destroyed and turned upside down by these cursed LED headlights. It's quite clear now after years of fruitlessly battling those responsible that nothing is going to change. And I'm just done

with it. But I do have one last thing to say to those guilty. To Ann Carlson and all at the NHTSA; to the State DOT's and local law enforcement; to those at the FDA; to the elected officials who have not done and clearly will do NOTHING; to Dr. Vance Thompson and the staff at Ophthalmology LTD and the Mayo Clinic who have all been dismissive of my situation and of all the LED-vision destroying evidence I have given them, and who all have refused to lend their credentials in this battle; and to all of the eye doctors and researchers who have published anti-LED papers and studies who refused to answer my cries for help: my blood will be on YOUR HANDS. You may not face consequences in this life for what you have done to me and millions of others. But there is a God and there is a hell, and you WILL pay for your crimes some day. I have read in several of these comments "It's going to take the death of someone rich and famous from LED headlights before something is done". Well I am neither rich nor famous, but maybe the martyrdom of one inconsequential person will get the attention of just the right person. Bye.

B.2087 October 8, 2022 — Astoria, United States

It's soooo dangerous, I have a very hard time driving at night!

B.2088 October 8, 2022 — Lebanon, OR

been having a hard time riding my bike for how my sunglasses and goggles cant reflect them from my eyes since i find the bright white LEDS be annoying when they should not be on in the day or night

B.2089 October 10, 2022 — Gainesville, FL

Cannot drive at night due to these LEDs.

B.2090 October 11, 2022 — Arlington, VA

I have found these lights totally blinding at night and find them dangerous! I may not see a pedestrian because of them.

B.2091 October 11, 2022 — Goleta, CA

Bigger and brighter is NOT better! Also we are suffering from Visual Overload with more and more brilliant stop lights, borders around them, neon buttons to mark the lanes, way too much Visual CLUTTER. It is getting increasingly challenging and way overboard and unnecessary!

B.2092 October 11, 2022 — Goodyear, AZ

There are so many ways to assault people, in which the effects may be felt only gradually, over time, and by degrees. In the case of driving, sudden blinding may make other road hazards not visible, leading to sudden disaster. When government agencies are captured by the companies they allegedly regulate, harms, such as these harms, may continue unless there is concerted rebellion by the public.

B.2093 October 11, 2022 — Hatfield, AR

Blinding lights kill

B.2094 October 11, 2022 — Mastic, United States

too blue are these lights horrible in fog. need to return to soft white color temp. 3000 to 4000 on the kelvin scale no higher. yellow not blue

B.2095 October 11, 2022 — United States

common sense please

B.2096 October 12, 2022 — Lehigh Acres, FL

I agree these headlights are dangerous. They are definitely blinding.

B.2097 October 12, 2022 — Magnolia, TX

You can buy a 40,000 lumen led headlight on eBay and Amazon right now. No where on Amazon/eBay is it mentioned that these items are illegal for on road use. People have already been blinded and injured by the recklessness of these sellers. A class action against Amazon/eBay would put a stop to this.

B.2098 October 12, 2022 — Mount Pleasant, United States

Extremely bright lights really bother me at night. The LED & HID headlights are extremely bright & almost blind me. This is most dangerous!

B.2099 October 12, 2022 — United States

I have post concussion syndrome. These ridiculously bright lights have nearly caused me to just pull off the road until they pass by.

B.2100 October 15, 2022 — United States

It's not all LED lights. They are called xenon lights. They are incredibly bright. This year the FTC approved pixel headlights for the regular LED lights. What this does is shade out an area where there is an oncoming vehicle or one in front of you. Many manufacturers have these features, but they weren't activated cause they were illegal. I did sign the petition, but I wanted to make sure before you sent it, that most of the issue is with the xenon lights. People will have them installed by a third party, and most of the time they aren't installed properly. The lights should be adjusted to shine on the road directly in front of the car. A lot of people install them themselves and don't do it properly.

B.2101 October 15, 2022 — Warren, MI

These lights are dangerous.

B.2102 October 16, 2022 — Raleigh, NC

My commute includes driving home after dark for about an hour and there are many cars out there that appear to have their bright headlights on. Some may not actually have them on. If they do, they are major assholes!

B.2103 October 18, 2022 — Long beach, MS

With me having epilepsy my seizures have spiked in numbers due to the effects of the lights!!! I work and I am a closing manager so the seriousness of these lights being banned would do wonders for me!!! I have had 13 plus seizures in the past two weeks!!!

B.2104 October 18, 2022 — Saskatoon, Canada

I have really bad light sensitivity and where I live it's not an option to just not drive. Here in Canada we have long nights in the winter and we also have LED car lights. I get temporarily blinded by those lights and it's a serious issue. One day I, or someone else I know may crash, get injured or die.

B.2105 October 19, 2022 — Austin, TX

Every small change matters

B.2106 October 19, 2022 — Jacksonville, FL

It's getting extremely difficult to drive at night.

B.2107 October 20, 2022 — Nashville, TN

I'm signing because these headlights are truly Dangerous. I now drive with sunglasses on as a few times, I've almost hit a pedestrian having been blinded by an oncoming LED featured vehicle. Jeeps and 18-wheelers seem to be the brightest and most offensive, hazardous. On some vehicles the daylight headlights shine Wide, spotlighting side-view mirrors AND houses on residential streets. When these lights first hit our streets, I asked a Nissan engineer WHY the new lights; his reply with a smile, "If we can save a buck...."; aka LED's are cheaper. Congress or the FHA MUST implement a mandatory, standardized low lumen as they did in the '80s with halogens. This is irresponsible private and federal sector management.

B.2108 October 20, 2022 — Nashville, TN

This 2021 NYT article is interesting. https://www.nytimes.com/2021/06/05/business/led-hid-headlights-blinding.html?smid=url-share

B.2109 October 21, 2022 — Piscataway, NJ

90001

B.2110 October 22, 2022 — Amelia Court House, VA

I am blinded every time I drive at night by the ridiculously bright LED headlights. They are dangerous and need to be banned.

B.2111 October 22, 2022 — Manchester, MO

Quite frankly I find these bright lights at night, when a car is following me sets off PSTD that I am getting ready to be pulled over by law enforcement. For years, the only time you would be exposed to these lights was when law enforcement was ready to pull you over. These lights trigger a panic response that I am doing something wrong and need to look for a place to pull over before their red siren lights came on. This is due to conditioning from decades of driving in a world where the only time we were exposed to this was for an emergency or other issue where I needed to respond to the bright light warning. Was I speeding?

B.2112 October 24, 2022 — Denver, CO

Until 2012, LEDs were classified as lasers. I don't want humanity to suffer severe eye trauma. Incandescent and halogen headlamps have served us well for many decades and the severe glaring of oncoming traffic with LED lamps is incredibly dangerous. LED is surface illumination and not point illumination, this technology on the roads was never legal to begin with.

B.2113 October 26, 2022 — Bradford, United Kingdom

These blinding lights are dangerous. They distress me when driving in the dark.

B.2114 October 27, 2022 — Canal Winchester, OH

Fuck led headlights

B.2115 October 27, 2022 — San Diego, CA

I find the LED headlights very dangerous while driving.

B.2116 October 30, 2022 — Rochester, NY

These headlights are making it harder and harder to drive at night time.

B.2117 October 31, 2022 — Lincoln, NE

Night driving is dangerous greatly in part to blinding head lights. Especially the bright bluish head lights! Are there safety studies which can identify the safest head lights for night driving?!!!!

November 2022

B.2118 November 3, 2022 — Athol, MA

These lights are ridiculously bright and blinding. If you have a vehicle with these lights approaching you and behind you, you are completely blinded. This is clearly not a safety improvement.

B.2119 November 3, 2022 — Midlothian, VA

Those light are too bright, can be dangerous, can cause sickness, headaches,rashes and aren't necessary

B.2120 November 7, 2022 — Kaup, India

HID headlights from two wheelers to hour wheelers all is a showoff for the vehicle owner. It encourages high speed at night time for the vehicle owner with hid and the same blinding lights are a hazardous for oncoming traffic. With a very high probability of accident due to combination of owners speed and blind oncoming traffic. Save life's say no to HID led headlamps.

B.2121 November 8, 2022 — Bangor, ME

I have astigmatism and bright headlights put my life at risk

B.2122 November 9, 2022 — Washington, DC

I almost hit a pedestrian in a crosswalk last week. She was right in front of me but I couldn't see her, or anything, because of the headlights on the opposite vehicle. Why are these high-lumen blue headlights allowed?

B.2123 November 9, 2022 — panama, United States
I can't see s..t!!!

B.2124 November 10, 2022 — Lincroft, NJ
i can no longer drive at night!

B.2125 November 11, 2022 — Chicago, IL
I can't drive at night and I'm having hard time changing lanes checking the mirrors and being blinded by cars behind me

B.2126 November 11, 2022 — Horsforth, ENG, United Kingdom
I'm sick of getting dazzled by stupidly bright headlights

B.2127 November 15, 2022 — Damariscotta, ME
I drive at nite a lot, and at 72, worry that my high-beam recovery time may be diminished.

B.2128 November 15, 2022 — Middleboro, MA
LED headlights are dangerous and blinding to everyone except the person who has them and should be illegal!!!

B.2129 November 17, 2022 — Alexandria, VA
I'm signing this petition because I am sick of being blinded by oncoming cars at night. It is very dangerous. Car makers should be held accountable for accidents that occur because of this.

B.2130 November 17, 2022 — Manchester, ENG, United Kingdom
So many near accidents due to blinding headlights !

B.2131 November 17, 2022 — Mitcham, ENG, United Kingdom
These are so dangerous - I would like to know how many accidents have been caused by them?

B.2132 November 17, 2022 — Orlando, FL
Rudolph Cardone

B.2133 November 17, 2022 — Saint Paul, MN
get that out of my face

B.2134 November 17, 2022 — Weston-super-mare, ENG, United Kingdom
Modern headlights dazzle and so are dangerous

B.2135 November 18, 2022 — Loveland, OH
I hate LED lights.

B.2136 November 19, 2022 — Blossvale, NY
Driving is becoming more difficult and dangerous due to blinding lights(headlights, tail lights, turn signals, daytime running lights, etc.) from other vehicles that are proliferating today. The glare from these lights makes driving even more difficult for older drivers whose eyes take longer to recover from flashes of bright light. Exposure to the blue light component of LED lighthas numerous health effects including disruption of circadian rhythms and sleep and may be a contributer to age-related macular degeneration.

B.2137 November 19, 2022 — Bradenton, FL
I am SICK of being blinded while driving. If there's even a LITTLE dirt on my windshield, the light scatters across my windshield and it makes it super hard to see at night. Plus, all the rednecks love installing the brightest, bluest lights they can on their trucks in my area. I also get migraines/nauseous if I see too much bright light. BAN ALL WHITE LIGHTS. Yellow/warm lighting only and I would argue making that so for EVERY residential use (landscaping for example). White lights just blind us and suppress our melatonin production. This is an area of technology that does not need further advancement. For the betterment of mankind, we need to plateau our headlight tech, nay our lighting in general, at warm lighting and call it a day.

B.2138 November 20, 2022 — Everett, MA

These lights are one of the biggest reasons I cannot drive at night. I already have horrible vision and will be getting LASIK eye surgery soon due to the difficulties I face. I am stunned that anyone besides law enforcement can have these lights. They are the equivalent to driving with high beams and I certainly believe that the auto accident rates have sky rocketed since this engineering failure.

B.2139 November 21, 2022 — Glidden, IA

Most semis have 4 bright LEDS headlights too!!

B.2140 November 22, 2022 — Champlin, MN

I get blinded every time I drive at night I wear sunglasses but afraid I will hit a deer a dog mailboxes or even a person, I try to drive at night without sunglasses and I get head aches every time from the new white lights

B.2141 November 22, 2022 — Fayetteville, AR

I'm tired of being blinded at night!!!! It's dangerous!!! And when it's rainy they reflect off the wet pavement!!!!

B.2142 November 23, 2022 — Bootle, ENG, United Kingdom

It's a serious hazard.

B.2143 November 23, 2022 — Perth road, Canada

It is so dangerous. Those lights are blinding for everybody but especially for seniors and more prone to night vision problems

B.2144 November 24, 2022 — Halifax, Canada

Tall SUVs, trucks, and especially Jeeps should not be allowed to have LED headlights. They are too bright and we are all below the cutoff shield. What happened to the purpose of the cutoff shield? But even smaller vehicles are guilty too. Toyota you're the worst! The reflection on rainy days is horrible. If the roads have hills one gets blinded coming over the crest. If the divided highways are not on the same level you are blinded. This is not safe! I hate driving at night now and refuse to be in front of them! I wrote the transportation safety board to express my concern!

B.2145 November 24, 2022 — Walsall, United Kingdom

I can't see, they're blinding

B.2146 November 25, 2022 — London, United Kingdom

Absolutely. No need what-so-ever for it, it's down to trendy looks NOT proper optical engineering and design. To an extent the rear light problem can be mitigated by keeping well back from the vehicle in front, unless of course the vehicle in front is being driven by an asshole who sits with their foot on the brake at stop signs and traffic lights. But headlights are a real problem as it's not practical and potentially fatal to try and avoid a numbnutz f***wit coming towards you on high beams and/or poorly adjusted main beams. Again it's in part down to poor/cheap light design for fashion, not putting light on the road in front where it IS actually needed. Rant over, I'm off to trim the wicks and top up the lamp oil on my vehicles lights.

B.2147 November 26, 2022 — Van Nuys, CA

Drivers who use bright led headlights force me to drive at night with sunglasses. It doesn't feel safe but I have no choice. I can't see otherwise.

B.2148 November 27, 2022 — Mississauga, Canada

I totaled my car because of these things.

B.2149 November 28, 2022 — Eau Claire, WI

I completely agree.

B.2150 November 28, 2022 — Maryville, TN

My eyes are very sensitive. The eye doctor said the back of my eyeball is very reflexive,and it shines back into my retinas. Ive almost wrecked many times over blinding lights. Especially jeeps.

B.2151 November 28, 2022 — Sweetwater, TN

Those lights TOO bright and they can cause accidents when you blind the driver coming towards you. Please, for the life of others, recall them and fix it and don't put any more on any other vehicles!

B.2152 November 30, 2022 — Beverly, NJ

I can’t see anything! I can’t see the road much less any pedestrians or cyclists that might be nearby.

December 2022

B.2153 December 1, 2022 — Irvington, NY

These lights are blinding, especially when driving in the rain. It's impossible to see where the road lines are, let alone if anyone happens to be crossing the road.

B.2154 December 1, 2022 — San Jose, CA

Please! I thought my eyes were going out and I wouldn't be able to drive in the dark anymore until someone told me that it's the LED lights on cars. At times it is blinding, so bad once that I had a complete panic attack on the road and had to pull over (before I knew about the lights). I'm reading up on this and I'm not the only one this is affecting. I 100% agree with this petition. Car makers should no longer be allowed to put these on cars! No one should die due to lights blinding them!

B.2155 December 1, 2022 — San Jose, CA

I might have to try this! Hope it helps!

B.2156 December 1, 2022 — San Jose, CA

The car manufacturers need to be sued for putting them on cars. I'm sure they know by now the dangers!

B.2157 December 1, 2022 — San Jose, CA

Try living in a HIGH traffic area like the Bay area where I do where you have TONS of these bright lights blinding you on your way home, I'm surprised I haven't crashed yet.....I have started taking back roads just to avoid these. This shouldn't have to happen.

B.2158 December 2, 2022 — Brooklyn, NY

It is terrifying to drive at night with these blinding lights. It is such a danger

B.2159 December 2, 2022 — Woodside, NY

I almost cannot drive at night now- it’s so disorienting. I can’t concentrate on driving safely when oncoming lights hit me in the eye- I’m blinded. And the ones coming up from the rear give a triple blinding effect in rearview and side mounts all at once. It completely alters depth perception.

B.2160 December 3, 2022 — Kingsport, TN

Yes it is..i see some led lights that aren't bad at all so i know they can be done right but most are ridiculously bright and move with the road on top of that. Not mad at the moving but when they do its usually right in my mirrors if they're behind me. I literally had to stop in the middle of the road once to motion a car around me cause i was completely blind. If you have the really bright led headlights and see me coming all i gotta say is good luck

B.2161 December 3, 2022 — Kingsport, TN

Yes cause they move as well so they not only hit every mirror and blind me they literally light up the entire inside of my car. I mean i can see their lights outshining mine in front of me and im the one ahead of them. Ive seen leds that are actually built correctly and they're not bad but most are ridiculous. I came here looking for sumn to sign to get em banned cause i just had to stop in the middle of the road and motion the car behind me around it was so bad. Like i mentioned above if anyone has those really bright ones and see me comin Good Luck is all I gotta say

B.2162 December 3, 2022 — Kingsport, TN

Yes and now they′re causing road rage…makes me wanna bright light everyone i see coming but that wouldn′t solve the problem

B.2163 December 3, 2022 — Kingsport, TN

Yes ban em…ive seen some that aren′t bad so i know they can be built correctly but most are ridiculous and we′ve dealt with this long enough and im over it

B.2164 December 3, 2022 — Kingsport, TN

Lets ban em…im gonna start fussing about em every website, every newsletter or wherever i see or hear about em im gonna fuss about em cause i just about wrecked on the way home just now which is why im here releasing all my anger on every comment i see

B.2165 December 3, 2022 — Kingsport, TN

Yea cant believe im gonna have to pull a Corey Hart just to drive now

B.2166 December 3, 2022 — Kingsport, TN

Yea and they even have the nerve to ride your bumper on top of the ridiculous lights. The lights move as well and usually right in every mirror of my car. I literally just had to stop in the middle of the road a few min ago to motion the truck behind me around cause i was blind and yes i was boiling mad but i let it go so im on here releasing my anger if anyone has those really bright ones and see me coming all i gotta say is good luck cause im not giving an inch anymore

B.2167 December 3, 2022 — Kingsport, TN

The jeeps are worst of all em. Those are ridiculous and im sick of all of em… they′re bringing out the roadrage in me. BAN THESE LIGHTS. You know they have to know how bright they are but they don′t care as long as they make the sell and their drivers can see in their vehicle. Im over it so good luck to all yall with those lights when u see me coming cause im not giving an inch anymore and not slowing down no more cause i cant see. Hope we make it

B.2168 December 3, 2022 — Kingsport, TN

Push to ban em…thats what im doing .lets all work together…ive seen some that aren′t bad so i know they can be built correctly but they only worry bout their vehicle sale and the ones driving their vehicle. If they see me coming all i gotta say is good luck cause im not giving an inch nor slowing down anymore

B.2169 December 3, 2022 — Kingsport, TN

Push to ban em

B.2170 December 3, 2022 — Kingsport, TN

Push to ban em

B.2171 December 3, 2022 — San Diego, CA

I can′t see when there′s a car with bright headlights behind me. There′s no way to get away from the light and it′s super dangerous to guess at where you′re going when you′re driving.

B.2172 December 3, 2022 — Stourbridge, ENG, United Kingdom

I had a crash not long ago all because i was blinded by another cars LED super bright headlights and couldn′t see, therefore, crashed. Luckily it was minor, no one was hurt. Big cars, small cars, it really doesnt matter, they all seem to have super bright lights that dazzle drivers and all it takes is a setting through the ECU to bring down the brightness. My car isnt bright so i can confidently say im not the reason for increase in numbers of crashes but it would be great if all other cars was the same. Why have them so bright for? This must be addressed.

B.2173 December 4, 2022 — Braintree, ENG, United Kingdom

These lights are so dangerous…far too glaring.

B.2174 December 4, 2022 — Eastsound, WA

I live on an island where there are no city lights and I am literally blinded by oncoming cars that have new headlights they are a death trap

B.2175 December 5, 2022 — Carmel, IN

I live in Chicago and have a very mild astigmatism. In the winter it gets dark at 4:30 and driving with all these unregulated, uncalibrated, unaimed high beams can make driving in the dark dangerous to the point of dissuading me entirely. They're needlessly blinding and the light pollution is ridiculous.

B.2176 December 5, 2022 — Columbus, OH

I'm afraid to look at other cars, and that's not safe.

B.2177 December 5, 2022 — Holdbrook, NY

My eye sight damage has increased faster over the last 5 years due to driving at night and being subject to excessive bright lights. This damage has been confirmed by my Optometrist. There seems to be no escaping these bright lights unless I move all three of my rear view mirrors to direct the reflection elsewhere, thus impairing my safe view of the road even further. It's only worse with Jeeps and Large pickup trucks. I live in a suburban area and there is no reason for lights this bright.

B.2178 December 5, 2022 — Wake Forest, NC

I have become scared to drive at night because I can't see from the bright lights. It's horrible. General Motors trucks are the worst offenders. Bring the auto leveling headlights to the US quickly please.

B.2179 December 6, 2022 — Emmett, MI

Its mostly because aftermarket led bulbs by Sylvania and other companies....just go in autozone/walmarts etc you will see them for sale and they will go in any vehicle except they say only for offroad or such. So people are putting those into stuff not designed for use in their headlight assembly and no way to aim them correctly. More and more people are doing this. Yes some vehicles like newer jeeps come stock with wayyy too bright leds but monkey see monkey do they all go and buy them because why not everyone else is doing it right? They ate lucky i am not like i was in my younger years i would of been hitting them back with a spotlight in return for blinding me.

B.2180 December 6, 2022 — Emmett, MI

Its mostly because aftermarket led bulbs by Sylvania and other companies....just go in autozone/walmarts etc you will see them for sale and they will go in any vehicle except they say only for offroad or such. So people are putting those into stuff not designed for use in their headlight assembly and no way to aim them correctly. More and more people are doing this. Yes some vehicles like newer jeeps come stock with wayyy too bright leds but monkey see monkey do they all go and buy them because why not everyone else is doing it right? They ate lucky i am not like i was in my younger years i would of been hitting them back with a spotlight in return for blinding me.

B.2181 December 6, 2022 — Raleigh, NC

Bright headlights are dangerous to oncoming traffic.

B.2182 December 6, 2022 — Three Oaks, MI

LED headlights are too bright. They need to be ticketed and banned. They are blinding and dangerous.

B.2183 December 6, 2022 — WALLASEY, United Kingdom

I find the bright lights coming towards me makes it difficult to see where I am going

B.2184 December 7, 2022 — Stowe, VT

It leaves burned after images in my vision even if I'm averting my eyes. Causes instant migraines. Completely ruins my ability to see the road. Impossible to use rear view and side view mirrors when an LED equipped car is directly behind.

B.2185 December 9, 2022 — Excelsior Springs, MO

I've become much more sensitive to light recently and the LED lights that were annoying and disorienting when I was first driving have become blinding. These types of headlights may make driving at night easier for those in the car but that comes by sacrificing everyone else's ability to see properly.

B.2186 December 9, 2022 — harrison, NY

I can't see what's in front of me when I am blinded by these LED lights,

B.2187 December 10, 2022 — Grants Pass, OR

I actually want to END people who drive cars with these. But it's illegal to murder so I'm signing a petition instead.

B.2188 December 10, 2022 — Shortsville, NY

Last week I ended up running a stop sign at a four way intersection because I was blinded by the lights on a pickup truck. Thank God no one was coming the other way or I might not be here to sign this. Thank you Mom and Dad for posting this!❤

B.2189 December 11, 2022 — Fishkill, NY

I drove on I95 north last night and was amazed at the number of vehicles with offensive headlights. It makes driving at night a bit scary. These high profile vehicles with unbelievably bright lights bear down on other vehicles causing blindness and disorientation. How are these allowed? This is a nightmare—literally.

B.2190 December 11, 2022 — GRAYSVILLE, AL

Those lights make it hard for me to drive at night and I used to love driving at night.

B.2191 December 11, 2022 — Phoenix, AZ

LED lights are dangerous and being sold to the public in the name of energy efficiency, despite health risks. There are better ways to conserve energy.

B.2192 December 12, 2022 — Huddleston, VA

I am signing because dont think these light do anything buy blind the oncoming cars. It is especially bad on the country roads

B.2193 December 13, 2022 — Casselberry, FL

I like to be able to see where I'm going when driving at night, but the intensity of LED headlights causes so much pain that I have to struggle not to avert my gaze when there is oncoming traffic. This is obviously a safety hazard, and after driving any distance more than a few miles at night, I often experience migraines and eyestrain headaches.

B.2194 December 13, 2022 — Collinsville, OK

Led headlights are dangerous!!!

B.2195 December 13, 2022 — Hounslow, United Kingdom

These headlights are blindingly bright and reduce the chance of seeing any pedestrians in that vicinity . Drivers will naturally close their eyes for a split second or look away which will give an opportunity to cause an accident in that split second. Also, when one of these over bright cars are coming towards you, it distorts your vision and you are unable to see any potential obstacle until it is too late.

B.2196 December 13, 2022 — Lake Orion, United States

I don't want to die because of someone else's too-bright LED headlights blinding me, my husband, or any of the drivers in front of us in the road!

B.2197 December 14, 2022 — Mantachie, MS

I've been blinded at least five times anytime I drive my18 wheeler at night-it is ridiculous and blinding for at least 15 seconds every time 勞

B.2198 December 14, 2022 — Whittier, NC

These lights are flat-out dangerous. Within the last month, I have been blinded (seeing purple spots) by three separate vehicles running these aftermarket LED's. Each of these incidents happened in BROAD DAYLIGHT. These lights are typically improperly aimed and are completely unnecessary for the safe conduct of the driver of the vehicle, day or night. To those who use them, your rights do not trump mine. While we're at it, let's ban the use of light bars, intended for off-road use, on public highways. There should be a restriction on the number of light sources, light frequency spectrum, dispersion, total lumens, etc. These people are putting others (elders, children, and others) at risk. To my rural friends. If I never see another lifted pickup truck, with its tail lowered blazing lights now blinding more people, wrecking the stability of the vehicle, and reducing the driver's visibility, it will be too soon. My state, North Carolina, has outlawed the practice of lowering the rear. Yet I continue to see these vehicles with out-of-state plates. My final word on this is that because you think it's cool, doesn't make it a good and safe idea.

B.2199 December 15, 2022 — United States

I personally am affected by LED lights, as they trigger severe migraine attacks and prevent me from rest and sleep, which males it even worse. I personally know others who are severely and badly affected by LED lights in the environment to the point where they can no longer participated in the LED dominated world, which is only getting worse. This may seem so trivial to you or others, but lighting choices can and do affect humans, animals, insects, and our environment on a scale much larger than we like to believe. Please speak up if LED lights are affecting you or anyone or anything in any negative way -whether it's small or large. Our voices are what's needed for change for all!

B.2200 December 16, 2022 — Eureka, MT

Your eyes don't recover as fast with LED lights coming at you compared to normal headlights. We have talked to other people who have problems with LEDs also. Unfortunately the snowplows in our state are using very bright flashing LEDs now facing behind them which are horrible to follow when dark. They are dangerous!

B.2201 December 16, 2022 — London, United Kingdom

It's dangerous and it affects lots of people.

B.2202 December 16, 2022 — Pascoag, RI

It's a Safety issue! If I'm blinded by oncoming vehicle I can't see any pedestrians!

B.2203 December 16, 2022 — Templeton, CA

This has become an increasing issue for me as more people get cars with these high-emitting headlights. I don't do crazy things with my eyes that make me especially sensitive. However, I have almost gotten in a couple of accidents due to the blinding light of oncoming traffic. I slump in my seat to avoid the rearview mirror lights. This is no way to live. Sometimes we just can't avoid driving at night and this is unfair to the public. Bring back the warmer but efficient lighting! If it ain't broke...

B.2204 December 17, 2022 — Center Line, MI

I want to drive safely at night without being blinded by other vehicles constantly.

B.2205 December 17, 2022 — VA, United States

These headlights are entirely too bright! When driving on the freeway, with a LED truck behind me and I need to pass the car in front I can't see behind me to safely go into the next lane. One evening I was driving through a small town, the oncoming SUV had BLINDING headlights, I couldn't see the people trying to cross the street. That scared me to death. These need to be banned for the safety of all people. Angela Aron Perkins

B.2206 December 18, 2022 — Helena, MT

I drive on two lane rural roads often. In addition to increased traffic, bright led and hid headlights are making driving at night too dangerous. I have to drive well below the speed limit just so I can stay in control when I'm blinded by a new car. This problem is even worse in the winter, when it's dark out during peak traffic hours and lights are amplified by snow.

B.2207 December 18, 2022 — Whitman, MA

As a frequent bicyclist, it can be a HUGE problem to be blinded by car headlights and tail lights. I try to buy responsible bicycle lights that aren't blinding to other people, but some car lights are so bright that I can hardly see after my eyes adjust! It is true that for healthy eyes, less light sources at night actually allow better night vision. The less light pollution we create, the better we can all see the road ahead.

B.2208 December 19, 2022 — Asbury Park, NY

This is dangerous

B.2209 December 19, 2022 — Frenchtown, NJ

These headlights are dangerous! There are times I have to pull over and come to a stop I am so blinded by them.

B.2210 December 19, 2022 — Hampton, Canada

The bright headlights are extremely unsafe.

B.2211 December 19, 2022 — Trenton, NJ

It's absurd can't even drive at night anymore!!! It needs to be changed

B.2212 December 20, 2022 — Lilburn, GA

I'm 50, with astigmatism and I've had Lasik. Even with glasses designed to cut the glare from lights at night I'm frequently blinded to a ridiculous degree by so called normal headlights. I also drive a Miata so I'm low to the ground and with newer trucks being so high up there is no way to escape it when they are behind me, it makes my mirrors useless. There is no need for this level of brightness in traffic. Yesterday's hi beams seem to be today's normal ones.

B.2213 December 20, 2022 — MI, United States

I find myself affected by these ultra-bright headlights, and I don't even have any underlying conditions for these lights to aggravate. I think we ought to invest in more streetlamps instead, which would make the brighter headlights unnecessary.

B.2214 December 20, 2022 — Port Arthur, TX

These are causing physiological damage to people, besides being absolutely blinding.

B.2215 December 21, 2022 — Grove City, OH

Getting blinded by these headlights has set up a passive form of distracted- and dangerous - driving conditions. My eyes cannot control their brightness. I can only control my driving while being blinded from behind as well as from what is coming towards me. The super brights are not sexy, not necessary, cannot be easily changed out of a vehicle for softer lights, and are stirring up road rage reactions in the eyes of the beholders.

B.2216 December 21, 2022 — Morgan City, LA

I'm sick of these blinding headlights it's Rediculous at night driving

B.2217 December 21, 2022 — Portland, OR

Driving blind is mortally dangerous even for an instant.

B.2218 December 21, 2022 — Portland, OR

Thank you Mark Baker for starting this petition along with your two friends! I was getting ready to start one myself and you beat me to it! Good for you my friend! We try not to drive after dark too much anymore because of these headlights. It is just too hard if not impossible at times to see! Not only do they need to stop making these headlights, but they also need to replace the ones that are out there on so many vehicles because if we don’t these vehicles that the lights are left in are sure to cause more traffic accidents! Due to the cost though I doubt that will happen but in my opinion, it still needs and should be done! ������

B.2219 December 21, 2022 — Traverse City, MI

Driving at night has become untenable for me because of the blinding glare of these lights. They are a hazard.

B.2220 December 22, 2022 — Portland, OR

I avoid driving at night when I need to strictly due to other's offensively bright lights. When I do drive, I place my mirrors into positions that makes them harder to use to avoid high intensity reflections.

B.2221 December 22, 2022 — Sanger, CA

I hate those lights. They are blinding not only coming toward you, but also when they are behind you

B.2222 December 22, 2022 — avondale, AZ

Car manufacturers have no brain now a day.

B.2223 December 22, 2022 — kansas city, MO

Im constantly blinded on the road by people in suv's and trucks with literal sun bright headlights. Its a real danger.

B.2224 December 23, 2022 — Belchertown, MA

the driving conditions in rural America have gotten ridiculous. There are no street lights or background light so your pupils dilate even more until these new led lights come along and are so bright that they feel like they're burning your retinas!

B.2225 December 23, 2022 — Enfield, ENG, United Kingdom

LED headlights are dangerous

B.2226 December 24, 2022 — Boise, ID

Bright headlights are awful

B.2227 December 28, 2022 — Bayfield, Canada

I'm signing this because these over bright headlights are a serious safety issue!

B.2228 December 29, 2022 — Joshua, TX

Tired of these lights blinding me to where I can't see for several minutes

B.2229 December 30, 2022 — Bakersfield, CA

Dangerous road conditions

B.2230 December 30, 2022 — Charlottesville, VA

New bright headlights are so blinding at night when they approach from behind driver can't see which lane the car is in and can't safely change lanes

B.2231 December 30, 2022 — New haven, CT

I am getting retina burnout from these headlights!

B.2232 December 31, 2022 — Atlanta, GA

These are dangerous for my family who sometimes cannot avoid driving at night

B.2233 December 31, 2022 — St Paul, MN

The more time goes on being lax on this issue the more these lights are popping up on our roads, and the more miserable it gets to drive at night.

B.2234 December 31, 2022 — Williamston, NC

I frequently drive long distances, so I do a lot of night driving. I have very light sensitive eyes and I get blinded by these headlights the way most people get blinded by high beams. We won't talk about how bad it is when I'm dealing with a driver who doesn't seem to know how to turn off the high beams on his already-too-bright lights. I've had to pull off the road to let my eyes readjust.

Comments left in 2023

January 2023

B.2235 January 1, 2023 — Johnstown, PA

Can't make our roads safer but sure can send other countries billions of dollars. We as Americans should be sick and tired of this crap.

B.2236 January 2, 2023 — Mount Vernon, OH

I'm signing because of the danger it causes for me to drive at night. The lighting needs to change, soon, before I get blinded and hit someone!!!

B.2237 January 3, 2023 — Little Stoke, ENG, United Kingdom

Current headlights are ridiculous! We are not in the desert! They are absolutely blinding and ultimately dangerous. Also, people don't seem to have the aim correct!

B.2238 January 3, 2023 — New Orleans, LA

LED headlights are fucking blinding

B.2239 January 4, 2023 — Scranton, PA

I'm a 24 year old young man with good eyesight (with my glasses on, of course), and tonight I was nearly blinded by a newer SUV with these ridiculously bright blueish-white lights. I've come across vehicles like these before, and they're always a problem, but I usually pass them by or turn soon after encountering them. Tonight was different. This driver followed me for several miles through the city and on the highway and their LED lights coming in from all of my mirrors were absolutely blinding; it was painful just trying to focus on the road in front of me. After nearly 10 minutes in traffic with this vehicle behind me, I had to take a detour and stop just to rest my eyes for a minute. There either needs to be major steps taken to lessen the impact of these blinding LED lights or they need to be banned. I'm not a driver that gets distracted easily, so I imagine other drivers with less than great eyesight might have major issues, especially if they're exposed to them over extended periods, like I was.

B.2240 January 4, 2023 — Winchester, VA

I'm signing because at night it gets bad foggy raining out. You could sit for a minute in a parking lot someone comes parking in front of you wit them stupid bright blue LED lights on high beams then next thing you know you can't see for awhile. Whomever started to put these blinded lights totally didn't analyze or think this through how the lights could blind out someone or even yet people with seizures it could effect those with seizures

B.2241 January 5, 2023 — Alpha, OH

sometimes bright headlights are more dangerous than no headlights.

B.2242 January 5, 2023 — Brampton, Canada

It's tooo damn bright and my eyes hurt!

B.2243 January 5, 2023 — Pell City, AL

I've been a truck driver for over 16 years and I'm on the road a lot at night. The led headlights are essentially like having your high beams on constantly. I'm beginning to have frequent headaches and unable to scan the road as well as before the led headlights were introduced. The excessive brightness of the "daytime" classified headlights create dangerous situations whether someone is passing me or crossing my path on the highway. In order to keep everyone safe; we need to ban these headlights.

B.2244 January 5, 2023 — Warrior, AL

I have had to stop my car in the middle of the road suddenly because I could no longer see the road and a drop off was to my right; the on coming car momentarily blinded me with their headlights. I have run off the road on two occasions because I couldn't see after passing a car with LED headlights. I have sit crouched down and toward the middle of my car if they are behind me OR position my mirrors to an unsafe place to keep the glare out of my eyes. I have had to pull off the road many times

to just let the person pass me because I couldn't drive due to their headlights. This is a huge safety hazard!!!

B.2245 January 5, 2023 — Westerly, RI

These are a danger to everyone that travels at night.

B.2246 January 6, 2023 — Covington, LA

LED lights are not equivalent or better than incandescent lights, and are especially detrimental and dangerous in certain situations (ie, automobile headlamps).

B.2247 January 6, 2023 — Dallas, GA

It is True, LED headlights Makes it Difficult to See Particularly on Dark Nights. Being an Able to See for a Second Can Cost Your Life or Someone Elses.

B.2248 January 6, 2023 — Georgetown, OH

Day or night they are blinding! You cannot tell if they are dim or high and when it rains especially at night, completely blinding literally have to come to a stop to either keep from going off road or hitting them!

B.2249 January 6, 2023 — Pittston, PA

I have epilepsy. When a line of cars drives infront of another with a set of bright LED lights, it causes my heart to race. Not only do I have to worry about emergency services hazard lights, I now have to watch for civilians ill equipped vehicles. This does not happen with a standard yellow bulb. I avoid driving at night at all costs now. Its one thing for it to be an emergency response crew..theyre there for assistance. These are civilians. It's absurd that this is okay. They're doing it with street lights too and they're always going out, resulting in a fast pulse like flicker.

B.2250 January 6, 2023 — Suckit, AP

I'm tired of being blinded

B.2251 January 6, 2023 — Tucson, AZ

There's no reason LED headlights must be a blue-tinged 'cool white' emulating the HID arc; they can be tuned to emit white light of any color temperature, and should be legally required to emit a 'warm white' (or better yet, selective yellow) spectrum, with minimal blue wavelengths that cause significant glare and other visual issues deleterious to driver safety.

B.2252 January 7, 2023 — Somerville, MA

I can't see when the bright lights hit me while driving at night

B.2253 January 8, 2023 — Bath, NY

I detest the danger that these ridiculous lights cause. I've been driving for 60 years, when people haven't dimmed their lights it was highly annoying, not blinding. With these nasty blinding LED lights,I don't dare drive at night, anymore. How about a dose of reality!

B.2254 January 8, 2023 — Lafayette, LA

Police blue lights are too bright as well.

B.2255 January 9, 2023 — Bellevue, WA

These white headlights are blinding my visibility of the road. Looking away to avoid these white headlights is very high of distracted driving. Exposure to white headlights for a few minutes driving on road causing headaches. In an attempt to look away from these white headlights, drivers may not be able to detect any sudden occurrence of person/animal on road, and delays the reaction time.

B.2256 January 9, 2023 — Hampton, VA

I almost caused an accident last week b/c an SUV with BRIGHT, cool white headlights was right on the tail of my little coupe, BLINDING me!! It wasn't just the reflection from my mirrors, which was painful enough, but it seemed like a spotlight was on my car! I was in the left lane of the end of an off-ramp, waiting for the light, to turn onto a busy three-lane, two-way street, when he pulled up (VERY close) behind me! I had to turn VERY SLOWLY, (BARELY moving at all) and still veered a little into

the next lane! I continued to drive VERY SLOWLY, in an effort to force the idiot to go around me! Even then, it took almost a full minute for my eyes to readjust! This was in a pretty well-lit area, with NO fog - this is MADNESS!! SOMETHING NEEDS to be done, NOW!!!!

B.2257 January 10, 2023 — Chiefland, FL

I cannot see at night due to the use of LED or HID headlights.

B.2258 January 10, 2023 — Åland Islands

LED headlights are dangerous on unlit rural roads - the glare completely drowns out a view of the road edges and the shape/width of the oncoming vehicle.

B.2259 January 12, 2023 — Irving, TX

Someone on the road flashes their LED lights at me rapidly fast because they were mad I was going to slow for them. People are literally using these to harm individuals because of their own uncontrollable road rage. I nearly got in a wreck trying to get away from them because I was BLINDED.

B.2260 January 12, 2023 — Seattle, WA

These new headlights are absolutely blinding at night time

B.2261 January 13, 2023 — Brentwood Bay, Canada

These lights are not necessary and dangerous!

B.2262 January 13, 2023 — Mankato, MN

Driving at night is becoming dangerous, it seems. Oncoming lights are way too bright.

B.2263 January 13, 2023 — Nelson, Canada

I avoid driving when dark because I feel blinded by the lights of oncoming vehicles. It is just too dangerous.

B.2264 January 13, 2023 — North Saanich, Canada

Bright headlights in oncoming vehicles are a safety hazard and either they must be modified to reduce glare or windshields must provide enhanced shielding.

B.2265 January 13, 2023 — Salt Spring Island, Canada

those oncoming car lights are dangerous , I am very concerned about having to slow down and becoming a hazard myself having to close my eyes until that car has passed.

B.2266 January 13, 2023 — Victoria BC, Canada

It is dangerous to be driving and have such high beam lights blinding me. I have to cover my side mirror if someone behind me has them or I can't see ahead of me. It's Very distracting.

B.2267 January 13, 2023 — Victoria, BC, Canada

I'm about to give up driving at night because of these blinding headlights, which severely limits my social life.

B.2268 January 13, 2023 — Victoria, Canada

These lights are blinding! And dangerous for on coming drivers.

B.2269 January 13, 2023 — Victoria, Canada

These lights are blinding. Why are they allowed? We have to buckle up but ok to drive blind?

B.2270 January 13, 2023 — Victoria, Canada

These are to darn Bright.

B.2271 January 14, 2023 — Burnaby, Canada

I hsbr same issues with these lights

B.2272 January 14, 2023 — Comox, Canada

Blinding headlights are dangerous !

B.2273 January 14, 2023 — Duncan, Canada

Not only are the LED headlights blinding going forward but are extremely blinding when you are followed from behind. I have to move my review mirror down in order to get my sight back. I think all cars and trucks should switch back to tungsten lighting by law.

B.2274 January 14, 2023 — Nanaimo, Canada

It's dangerous no one's lights should be that bright

B.2275 January 14, 2023 — New Westminster, Canada

These LED lights are a hazard. They are too bright. When they are calibrated poorly, they are even more blinding for oncoming traffic than driving with high beams on all the time!

B.2276 January 14, 2023 — Port Alberni BC, Canada

the new head lights are too Bright,i thought the the lights could not be over 35 watts ?

B.2277 January 14, 2023 — Saanich, Canada

I am blinded on the roadways and wonder why these lights are permitted on the roads!

B.2278 January 15, 2023 — Christina Lake bc, Canada

I have light sensitivity and vertigo both are affected by leds

B.2279 January 15, 2023 — Dracut, MA

i'm sick of being blinded by headlights every night

B.2280 January 15, 2023 — Kitchener, Canada

These lights cause a smaller field of vision to oncoming drivers and that issue is multiplied when it's dark and rainy. As a professional driver for 34 years I find these lights dangerous , especially when these lights are on the front end of todays huge pickups and SUV'S, having them behind you causes it's own issues with the blinding light reflecting into your eyes via the rear view mirror. On a separate note, why do so many people drive with their high beams on, it exasorbates the problem.

B.2281 January 15, 2023 — Lazo, Canada

I'm tired of getting a migraine whenever I drive at night, and it only gets worse when it rains and everything becomes a reflective surface.

B.2282 January 15, 2023 — Makawao, HI

Blinding headlights suck either coming at you or coming up behind. Can't see anything else but that blinding light, it's dangerous!!

B.2283 January 15, 2023 — Nanaimo, Canada

Lights are blinding at night.

B.2284 January 15, 2023 — New Westminster, Canada

I 100% agree

B.2285 January 15, 2023 — QUALICUM BEACH, Canada

Because we all need to be safe

B.2286 January 15, 2023 — Sooke, Canada

I find the new LED lights blinding. They are dangerous and keep people from driving at night thereby reducing their quality of life Please regulate the strength, type, and angle of car headlights.

B.2287 January 15, 2023 — Surrey, Canada

I drive and hate those lights coming at me. My biggest fear is the blinding effect. Please ban those darn lights

B.2288 January 15, 2023 — Vernon, Canada

more than just a distraction, tjey are dangerous

B.2289 January 16, 2023 — Armstrong, Canada

These lights are unnecessarily bright and very dangerous. Many vehicles do not have them aligned properly either.

B.2290 January 16, 2023 — Birmingham, AL

I have photophobia (sensitivity to light), and driving at night or in the rain is especially difficult when LED headlights are repeatedly shining in my eyes. Warmer and less bright lights are much preferred.

B.2291 January 16, 2023 — Port Moody, BC, Canada

They're dangerous!!

B.2292 January 16, 2023 — Qualicum Beach, Canada

Bright whites are the worst to drive against. They're blinding, dangerous, and cause horrendous glare. GET RID OF THEM NOW. I won't ever buy a car that has them, ever.

B.2293 January 16, 2023 — Squamish, Canada

LED headlights should be Banned! Absolutely blinding to oncoming traffic

B.2294 January 16, 2023 — United States

This is dead serious! The LED headlights completely blind the oncoming driver and continue to be the main reason for fatalities. Unfortunately, it's all about these car manufacturers saving money. Find a soft bulb that doesn't cause blinding glare! This has to stop!!!

B.2295 January 17, 2023 — Columbus, GA

I have had trucks and SUV's approaching from behind and in front of my car and have been totally blinded.

B.2296 January 17, 2023 — Grants Pass, OR

It's getting to the point where driving at night is more dangerous than ever. It seems like at least half the vehicles out there these days have absolutely blindingly bright headlights. Quite often the only thing I can see is the fog line when these vehicles are coming at me. It's no surprise to me that the motor vehicle death rate is on the rise. Driving at night anymore is downright scary.

B.2297 January 17, 2023 — Morristown, NJ

I drive a sedan and a hatchback.

B.2298 January 17, 2023 — Mount Pearl, Canada

Vicki Crocker

B.2299 January 17, 2023 — Newark, DE

These lights have been bothering me both when I drive, and when I walk on foot at night. They make it very hard to see. Old headlights were just fine...and there's no reason LED lights can't be just as good, they just need to turn down the brightness to the same levels as before, and softening the color temperature would also help. I have LED lights in my home that look just like old incadescent lights, so there is no reason we can't make car headlights that are the same!!! I want this fixed ASAP.

B.2300 January 17, 2023 — Tempe, AZ

There needs to be rules around bright LED Headlights. They are a hazard to Evey

B.2301 January 18, 2023 — FREDERICTON, Canada

I agree with Mac Moss

B.2302 January 18, 2023 — Miami, FL

We Thank You for Your signature & support Karen. Please Share this petition with as many people as possible & please take a look at this other petition as well. Thanks Again. https://www.change.org/p/justin-trudeau-elimination-of-bright-hid-led-headlights

B.2303 January 18, 2023 — Sacramento, CA
Catherine Nevin

B.2304 January 18, 2023 — Toronto, Canada
I agree

B.2305 January 18, 2023 — Victoria, Canada
For years, I have struggled with night driving due to the white lights. They cover my entire windshield when coming at me and my tires have gone off the edge of the road on a curve on a few occasions. The bright white lights are too dangerous to use, especially on pickup trucks which are highter than any car. I am grateful for this petition. Karen Martin, Victoria, BC

B.2306 January 18, 2023 — cold lake, Canada
I have be blinded by these lights on the highway. Not safe to be hurtling into nothingness all of a sudden

B.2307 January 19, 2023 — Albuquerque, NM
Lights that are too bright are not safe for oncoming drivers. This needs to be regulated.

B.2308 January 19, 2023 — Couridjah, Australia
I'm so sick of being completely blinded driving home from work at night on 100km country roads. And of people that think their high beams aren't on and their car came like that so it's fine. It's not fine, it's dangerous, selfish and stupid. Clean the casing and lower them before you get someone ram into you because they literally can not see.

B.2309 January 19, 2023 — Northampton, MA
We need to ban excessively bright headlights for everybody's well-being.

B.2310 January 20, 2023 — Montreal, Canada
I, like the others who sign this, experience this phenomenon every time I drive at night. In ordinary sedans and coupes, the effect of these lights is hard enough to deal with. How many pick-up trucks and SUVs are currently on the road, often with fancy secondary strings of lights. The effect is stunning and very dangerous. I find myself braking suddenly and slowing down because I have become blinded. They are a danger. Please fix this. problem. It should not exist.

B.2311 January 20, 2023 — Salem, MA
Im blinded by the lights... I can not drive at night because of these lights

B.2312 January 20, 2023 — Salt Spring Island, Canada
These headlights ARE blinding, especially at night without streetlights and proper lines on the roads. These lights should be banned!!!

B.2313 January 20, 2023 — Toronto, Canada
Those LED lights look bad. I see them on cars and they glare and throw a bad light. They are unhealthy and our Christmas tree looks sad with these lights. They are a mistake. Gov't makes so many mistakes and it costs so much...life and dollars.

B.2314 January 20, 2023 — Victoria, Canada
I'm avoiding driving or cycling at night because of the blinding led lights of oncoming new cars trucks and suv. I've had to stop and pull over to wait and get my vision back

B.2315 January 20, 2023 — salt spring island, Canada
driving at night has become impossible and dangerous so many times I have had to come to a full stop knowing there is a curve in front of me but am not able to see it.

B.2316 January 21, 2023 — SaltSpring Island, Canada
Because of the blinding lights @ night I won't drive @ night any more!

B.2317 January 21, 2023 — parsippanny, NJ
I am a parent to a teen and i am concerned about all teens

B.2318 January 22, 2023 — Manchester, NH
LED Bright lights are bright.

B.2319 January 22, 2023 — Stratford, ON, Canada
Blinding headlights makes danger.

B.2320 January 23, 2023 — Spokane, WA
The extreme brightness and angle of the LED headlights has made it so I can't safely drive at night. Even during the day I have to switch my review mirror to night driving and often flip my side mirrors to avoid the glare. and wear sunglasses day and night. Non of this is safe and has also negatively affected my activities in all areas of my life. This needs fixing.

B.2321 January 24, 2023 — Mount Laurel, NJ
I support

B.2322 January 24, 2023 — Seneca Falls, NY
I can't drive at night anymore. Blinded by headlights is dangerous.

B.2323 January 24, 2023 — Toronto, Canada
I want to improve road safety at night.

B.2324 January 25, 2023 — Billerica, MA
Elaine Crow I am blinded when driving at night and feel it is a serious problem.

B.2325 January 25, 2023 — Cheney, WA
I'm tired of having my vision messed up for 30 minutes after having bright lighted vehicles behind me. It should not be legal to have a light so bright that the driver is not able to look in their rear view mirror and side mirrors, this is a hazard.

B.2326 January 25, 2023 — Chicago, IL
led lighting is HORRIBLE...Dangerous, Ugly, Invasive, Unfriendly...while writing this many fatalities because of.....!

B.2327 January 25, 2023 — Springfield, OH
Tired of being blinded. The driver with the leds can see but the glare is blinding oncoming traffic.

B.2328 January 25, 2023 — WIldwood, MO
I had cataract surgery in 2017 at the age of 60. Driving at night is now difficult, and I'm still working so it's unavoidable. The advent of extremely bright bulbs has made it horrendous and is an accident waiting to happen.

B.2329 January 27, 2023 — Galway, Ireland
This seems to be a global issue now. We can't see where we are going. Blinded by the light!

B.2330 January 28, 2023 — Pinckney, MI
I've been blinded every time I drive after 9 pm- more times then I can count. I doubt if all these people have their high beams on, but it just as blinding!!!!!

B.2331 January 28, 2023 — Spokane, WA
I am blinded by the super bright headlights which makes driving at night very dangerous for me and I'm sure many others.

B.2332 January 29, 2023 — Houston, TX
There's no reason for those bright a$$ lights

B.2333 January 29, 2023 — Vancouver, Canada

Those type of headlights are blinding when oncoming.

B.2334 January 30, 2023 — Blakely, PA

It's so scary being intermittently blinded when I'm driving at night. I literally cannot see when a vehicle with LED headlights is oncoming and then for a few seconds after it passes. Which means when there's several cars in a row coming at me with the LED headlights, I can be completely unable to see for a minute or more. That is terrifying.

B.2335 January 30, 2023 — Huddersfield, ENG, United Kingdom

They are too bright and blinding

B.2336 January 30, 2023 — Las Vegas, NV

I can not see to drive when these LED headlights shine directly in my eyes. I seem to go blind. Very dangerous.

February 2023

B.2337 February 1, 2023 — Driftwood, TX

While driving at night I've lost the ability to see the road when vehicles coming in the opposite direction have incredibly bright headlights that blind my eyes. I don't understand why people who purchase vehicles with extremely bright headlights don't seem to grasp the reality that they are putting themselves, and others, in danger of causing head-on collisions at night because of the impact their very bright headlights have on other drivers.

B.2338 February 1, 2023 — Durham, NC

My cataract surgery resulted in more glare from lights at night, but it wasn't until the LED and Xenon lights became more common that it became a serious problem for me. Sometimes, I'm so blinded by oncoming headlights that I can't even see the lane markers for a few seconds. I need to be able to drive at night.

B.2339 February 2, 2023 — Emmett, ID

I'm sick and tired of the led lights everywhere. headlights that blind me from seeing any potential road hazards, police lights that almost have me come to a complete stop from the extreme flashing glare that only gets worse with new model squad cars. There's the neighbors who replaced their 6 outside lights with led on 24-7 so now I have to keep my blinds always closed at night. Add the new led street lights 4 blocks away, the only stars that one can see now are only the brightest. I live in a small town of 5k that 20 years ago there were lots of stars and darkness at night. No more.

B.2340 February 4, 2023 — Holly Ridge, NC

The headlight are blinding.have came close way to many times of going off the road being blinded by on coming headlights.

B.2341 February 4, 2023 — Santa Fe, NM

This is not just a health issue, but it is very much a safety issue! Blinding LED headlights cause collisions! When faced with blinding head lights, it is impossible to see the lane designations, or the vehicles that may be stopped ahead; it only takes a few seconds for the distraction and the disorientation to result in a collision and injury. There is no justification for LED headlights on vehicles or street lights. A law against them must result in a mandated car inspection that is required before a vehicle can be registered yearly, and/ or a hefty fine would stop the use of LEDs. But first, there must be a clear regulation.

B.2342 February 5, 2023 — NY, United States

I have to avoid driving at night because the glare from these LED lights is horrendous. They force me to look away from the road (does that strike anyone as dangerous?) or put up a hand in my front windshield to shield my eyes (same question). I wrote a complaint to the NYS DMV years ago but never heard back from them. These lights are someday going to drive me into a tree. They're fatally blinding. My son says the same thing when he drives - and that the light image is still in his eyes

EVEN after the car has passed, blinding him still. I already posted my enraged comments about LED lights in general on the light bulb ban opposition petition. Thank you so much for doing this petition.

B.2343 February 6, 2023 — Berkeley, CA

These lights are just awful. Ban them!

B.2344 February 8, 2023 — sb, CA

Headlights and brights have become the same. The only difference on new cars is when they turn on the brights the headlights angle up. Ill flash my brights at someone because i cant see a thing, they ignore it and ill have to stop in the middle of the road blocking traffic due to not being able to see anything but a wall of white like the photo above. Its not my fault you bought a car with headlights that bright, the owners should be required to dim them with tint or lesser bulbs by law.

B.2345 February 9, 2023 — Milford, NE

I signed because it causes eye injury, I drive at night and it makes perception of Road lines and boundaries extremely dangerous. When a bulb is over 4300 kelivin it provides no real benefit and washes out shapes and figures in the road. Making them appear to be in a different spot on the road, than they really are. With more than 68% of cars on the road being swapped to these bulbs. Its time officers enforce these rules and issue citations.

B.2346 February 11, 2023 — Clay City, KY

Yes they need to do away with the led lights . They blind me at night .

B.2347 February 11, 2023 — Kirkland, WA

Headlights are ruining my vision. If you do a bit of research you will discover that they are now using Laser technology in modern headlights? Are they trying to create a generation of blind people? This lights are ridiculous. They are not even safe! What is the point of blinding the on coming traffic? That doesn't seem to make any sense.

B.2348 February 12, 2023 — Billings, MT

I'm sick of being blinded by these lights and having to move my mirrors just because one of these people is behind me. They give me migraines and have blinded me many times while driving.

B.2349 February 12, 2023 — St. Kitts & Nevis

I hate being blinded

B.2350 February 12, 2023 — harvard, IL

They are binding and absolutely unnecessary. There's no reason someone needs to see a raccoon's butthole from a mile away and blind everyone is the process.

B.2351 February 13, 2023 — Bloomfield Hills, MI

Extremely dangerous for drivers of all ages. The car company that can solve this will sell more cars. Put some engineers on making these lights safer instead of adding more to the front and rear and inside of cars. Flying over cities now the lights on highways are extremely bright and all white. Ugly and blinding. Very unsafe. How many fatalities caused by this will the car companies say is acceptable before they solve the issue?

B.2352 February 13, 2023 — Granger, TX

I literally have to hold my hand up to block the glaring blue lights of oncoming traffic. The worst offenders are the pick-up trucks that are typically fitted with lift and light kits - which means MORE blinding blue-white LEDs.

B.2353 February 13, 2023 — Holland, MI

My eyes have been effective so bad I cannot drive safely anymore at night also when they are on standing still I get blinded.

B.2354 February 13, 2023 — United States

I know my own vehicle also blind other drivers. Had taken to the dealer to try to fix and told there's nothing they can do! So many time people high beam me thinking I have my high beam on! This is really ridiculous!

B.2355 February 13, 2023 — United States

This needs to go "viral" before these car manufacturers will do something about it! My guess is the car engineers don't even know how to drive! They probably Uber to work!

B.2356 February 14, 2023 — Atlanta, GA

I can't see at night

B.2357 February 14, 2023 — Batavia, OH

I signed because I would prefer not to be killed in an easily preventable accident caused by blinding headlights.

B.2358 February 14, 2023 — Crown Point, IN

I am legitimately afraid of crashing because I can't see with oncoming traffic.

B.2359 February 14, 2023 — Franklinton, NC

It's simply infuriating how regulatory authorities can be so blind to such a glaring health & safety issue. Ban these migraine-inducers!

B.2360 February 14, 2023 — Pittsburgh, PA

I'm only 53, but I have had to give up most driving at night. I have light sensitivity because of severe nearsightedness and migraines, and today's blinding headlights overwhelm my ability to see anything at all while driving at night. Lights are intended to help us to see our environment; when all we can see is the lights themselves, they are no longer useful or beneficial.

B.2361 February 14, 2023 — Salt Lake City, UT

I stopped driving at night not because of the deer, etc. but because of these lights

B.2362 February 15, 2023 — Bozeman, MT

Headlights are getting brighter and are blinding me while driving. Not only that, people are using illegal light bars.

B.2363 February 15, 2023 — Lincoln, IL

Hi, It's ridiculous, but it's good to know I'm not alone with the dread. You literally can't see the road in front of you, almost anything at all. Warmer yellow lights are nicer! Came across this on google articles. For the cure. Nicholas

B.2364 February 15, 2023 — Northfield, OH

I also restrict my driving at night due to the bright, blue-toned headlights located at eye-level

B.2365 February 16, 2023 — Beaverton, OR

[name removed] - Excellent observation. Please post these same comments on our petition to the FDA to regulate LED strobe lights: https://www.regulations.gov/document/FDA-2023-P-0233-0001

B.2366 February 16, 2023 — Chipley, FL

Many of these vehicles are after market equipped and there are already laws in most states requiring D.O.T. approval for all lighting but there are many false D.O.T. certifications on aftermarket equipment. A larger problem is police vehicle emergency lighting. Not only are the static lights absolutely blinding but before the evil of LED the beacons rotated and that rotation illuminated officers and others standing at or near the scene. However the LED light bars only emit blinding unidirectional light so objects other than the light source become invisible. If your are a LEO or know anyone that is a LEO please let them know drivers are not trying to run over them, they simply can't see them due to the non rotating beacon so stand behind that beacon and never near the roadway or

between the LEO vehicle and the roadway. Young drivers with healthy vision are vulnerable but those with even mild visual impairment may "follow the light" causing a collision with the source vehicle. If you wish to experiment stand in central location while someone a few feet away rotates a bright beam 360 degrees and note all objects are visible as the light is directed toward them. Next stop the rotation and shine that bright light directly in the eyes of the observer and ask if they can see any other objects in the vicinity. Setina and others should be smart enough to ascertain this situation but apparently they are not so it's up to those of us who care to enlighten them and prohibit police from purchasing these dangerous devices. Each time I hear of an officer being struck or nearly being struck at an accident scene I know these lights very likely played a part in that injury or death.

B.2367 February 16, 2023 — Dorchester, MA

I can't see shit!

B.2368 February 16, 2023 — Elgin, IL

I'm sick of being blinded on the way to work!!!!

B.2369 February 16, 2023 — La Crosse, WI

These lights are entirely too bright. I used to drive truck. On a windy 2 lace road aon a rainy night with no streetlights or other options and me weighing in at nearly 80,000 lbs, even sitting high up you are unable to see and off the driver coming at you, you may be running over them. You are not able to see anything but bright and reflection off the wet surface of the road.

B.2370 February 16, 2023 — Pawtucket, RI

Stock or aftermarket, these headlights should be illegal and possess at least a thousand dollar fine. The headlight manufacturers should be sued to hell & back.

B.2371 February 16, 2023 — San Diego, CA

It's NOT safe getting blinded by these outrageously bright lights that'll block my vision of the road, and prevent me from using my mirrors!

B.2372 February 16, 2023 — United States

I like to be able to see when I drive :)

B.2373 February 16, 2023 — Winter Haven, FL

I left the blinding rain reflection out of my comment. As one who hates night driving due to the incoming blinding lights, if it's raining, nothing is that important to risk an accident due to all the variables annoying lights have, now adding the double vision of reflective road conditions. I think at 65, I'm going to start learning how to navigate the senior assistance programs, learning at my pace, not being thrown into it, last minute not knowing what in earth I'm doing!!!

B.2374 February 17, 2023 — Bloomington, MN

many people have light sensitive eyes and this compounds the problem of bright headlights. Some drivers seem unaware that their lights are aimed wrong, directing their beams into the eyes of other drivers, while other drivers have their high beams on unnecessarily, also blinding their fellow drivers. This needs to stop. Drivers with bright beams on should be ticketed and issued fines. Headlights should be standardized to be below the eye-lines of other drivers.

B.2375 February 17, 2023 — Lewiston, ME

Getting blinded by more and more oncoming cars every night!

B.2376 February 17, 2023 — McKinney, TX

It's a serious problem, especially for those on smaller cars.

B.2377 February 17, 2023 — Newfane, VT

These headlights and tail lights are truly dangerous. They blind and distract and seem to be everywhere. Perhaps they improve the vision of the person who is driving with them but how can that justify their use when they blind oncoming traffic. They need to be banned.

B.2378 February 17, 2023 — Saint Petersburg, FL

I have been blinded by vehicle low beams that shine directly in my eyes instead of at the road.

B.2379 February 17, 2023 — Wallingford, VT

Newer headlights are way too bright - distracting and fatiguing - and on far too many trucks and SUVs, too high off the ground

B.2380 February 18, 2023 — Hudson, NY

First off this is a relief to know I'm not alone. I drive an hour home daily and this is through back country roads leaving my eyes unaccustomed to bright lights. I used to white knuckle drive in severe snow storms and now I'm doing this every time I drive after dark.

B.2381 February 18, 2023 — Lincoln, IL

Troll

B.2382 February 18, 2023 — Los Angeles, CA

It's dangerous to drive at night because of the blinding headlights - especially if you're in a sedan at the mercy of bigger and bigger SUVs!

B.2383 February 18, 2023 — McKinney, TX

Almost got fired for scratching a parked vehicle because I couldn't see due to blinding headlamps from another parked vehicle. I was in a delivery vehicle much higher than regular cars but still caught beams. This is not an alignment issue as the car companies are saying in order to shift the burden onto citizens. This problem can only be solved by banning unnecessarily bright lights on the road. You only need to see what's on the road far enough ahead to be safe. You don't need to light up everything between you an the horizon.

B.2384 February 18, 2023 — Ottawa, Canada

People have taken things too far and it will only get worse. This is just another form of reckless driving. If you can see the road with normal lights, you shouldn't be driving.

B.2385 February 18, 2023 — Port Saint Lucie, FL

Blinding lights causes accidents

B.2386 February 19, 2023 — Ottawa, Canada

*Can't see...

B.2387 February 19, 2023 — Rexburg, ID

I'm tired of being blinded and not seeing the road ahead

B.2388 February 20, 2023 — Homer, AK

Led lights are unsafe to oncoming vehicles. Anyone who has been on the receiving end of them knows this.

B.2389 February 20, 2023 — Laramie, WY

To keep my loved ones safe

B.2390 February 20, 2023 — Vancouver, Canada

I too am tired of being blinded by these lights. There used to be a "rule" when on a rural road or sans streetlights, you had to dim your high beams when you see an approaching car. These lights are far more blinding than a high beam light emitting from a "regular" headlight. Definitely Should be made illegal. Also, if you are driving a vehicle with these blinding lights, there is a risk of someone colliding with you due to temporary blindness.

B.2391 February 21, 2023 — Portsmouth, RI

We MUST BAN THESE LED HEADLIGHTS...They cause Eye Damage. They also cause accidents cuz you can't see past them like a Broadway Theatre Spotlight. Also Business Signs and Green Traffic Lightd are bad for the eyes. Let's gets these LED Lights banned before it's too late and our eyes are damaged.

B.2392 February 21, 2023 — Portsmouth, RI

LED LIGHTS ARE BLINDING and can cause accidents and eye damage. These LED LIGHT Manufacturers and Car Manufacturers need to be held accountable for the damage they are doing while making billions of dollars at the expense of our eye health and road safety.

B.2393 February 21, 2023 — United States

They need to be illegal. Yellow lights only.

B.2394 February 23, 2023 — Elk Grove, CA

Been blinded by these things while driving at night.

B.2395 February 23, 2023 — HERMON, ME

As a motorcyclist and migraine sufferer, I am acutely aware of this problem. Polarized glasses help but even then there are times when I am simply blinded by oncoming headlights - AND headlights in my mirrors. I sometimes wear sunglasses at night, fold out my mirrors and close my eyes while driving - none of which are remotely safe of course but still better than being blinded and seeing nothing for the next few moments.

B.2396 February 24, 2023 — Dursley, ENG, United Kingdom

Over bright headlights are a disaster in action. Surely the authorities can see they are dangerous to other road users. As they give a very bright spread of illumination they also can encourage drivers to drive too fast.

B.2397 February 24, 2023 — Phoenix, AZ

I'm tired of having spotty vision at night after being entirely blinded by completely unnecessarily bright lights from other vehicles. It's a safety risk AND it's permanently damaging to eyesight. Those lights should have NEVER been allowed to be installed into cars.

B.2398 February 24, 2023 — Placentia, CA

I literally can not see

B.2399 February 25, 2023 — Alexandria, VA

I am blinded by head lights .....both coming toward me and in my rear view mirrors!! It's dangerous and PAINFUL

B.2400 February 25, 2023 — Bolton, United Kingdom

My eyes are very sensitive and the head lights on cars are so bright and only getting brighter I have nearly crashed into parked cars as I'm driving past them with the glare of oncoming traffic it's very unsafe to the point I try to avoid driving when it goes dark

B.2401 February 25, 2023 — Boulder, WY

Being blinded while driving especially in our area because of living in the largest deer migration route in the USA

B.2402 February 25, 2023 — Chicago, IL

They are Uncomfortable

B.2403 February 25, 2023 — Clifton Park, NY

Honda pilot lights and pickup headlights are too bright

B.2404 February 25, 2023 — New Haven, CT

I can no longer drive at night, especially in the rain, due to the blinding brightness of led headlights. They are surely causing accidents.

B.2405 February 25, 2023 — Nixa, MO

These headlights are blinging and it makes me want to close my eyes. Instead I squint to be able to see.

B.2406 February 25, 2023 — Oakland, CA
Shauna Revelli

B.2407 February 25, 2023 — Salt Lake City, UT
The headlights blind me and I can't drive at night!

B.2408 February 25, 2023 — Seattle, WA
Driving at night, even in the late afternoon is getting increasingly unpleasant and dangerous unnecessarily.

B.2409 February 25, 2023 — South Euclid, OH
This is a serious safety issue. I can barely drive at night anymore, because I do not feel safe because I can barely see because of these absurdly bright headlights. Between this and people on their damned cell phones, it is getting less safe every day on the road.

B.2410 February 25, 2023 — Tuttle, OK
In my area, rural Oklahoma, the newer trucks lights are adjusted to high so when a trailer is hooked up they blind oncoming traffic. On many occasions I've just pulled to the side not being able to see.

B.2411 February 26, 2023 — Arab, AL
I can't drive at night anymore due to the led headlights. It hurts my eyes and I can't see, which is unsafe for everyone.

B.2412 February 26, 2023 — Barrie, Canada
I get blinded daily more and more over the last few years

B.2413 February 26, 2023 — Beaverton, OR
None of this is ok. Thank you for signing.

B.2414 February 26, 2023 — Bensalem, PA
Shining a light in people's eyes is used as torture, distraction, and to confuse them. That is what driving with these lights coming at me and from behind me does to me. It is blinding and distracts my attention from being literally able to see and pay attention to everything going on while driving.

B.2415 February 26, 2023 — Calabasas, CA
Headlights are truly blinding.

B.2416 February 26, 2023 — Chesnee, SC
I'm tired of being blinded by these lights. They are dangerous to oncoming traffic.

B.2417 February 26, 2023 — Columbus, GA
I thought it was just me that was having problems at night because of the brighter vehicle lights but now I SEE it isn't.

B.2418 February 26, 2023 — Cortland, IL
The new, super bright headlights are outrageous and need to be corrected ASAP!

B.2419 February 26, 2023 — Evansville, IN
We need change and increased safety.

B.2420 February 26, 2023 — Fuquay Varina, NC
I find LED headlights to present a driving hazard in many situations. They should be regulated to ensure they are just as safe as HID and halogen headlights. The height at which headlights are mounted on a vehicle should also be regulated?

B.2421 February 26, 2023 — Grand Rapids, MI
I am being blinded by these new lights. It literally causes me to turn my head away, thereby causing me to become a "distracted driver". If I physically cannot keep looking forward due to the pain from

bright oncoming headlights, how am I to be able to be fully engaged in safe driving? Please, please.....LOWER THE LUMENS!!!

B.2422 February 26, 2023 — Grove City, OH

I absolutely detest these lights. They hurt my eyes and make it less safe for drivers coming the opposite way.

B.2423 February 26, 2023 — Haltom City, TX

I've nearly been run off the road due to being blinded by oncoming vehicles with bright LED headlights.

B.2424 February 26, 2023 — Harvest, AL

Bright oncoming headlights are a safety hazard.

B.2425 February 26, 2023 — High Point, NC

Blinding headlights are dangerous and this important issue must be addressed.

B.2426 February 26, 2023 — Lansing, MI

Bright or righly called blinding headlights don't help anyone. It's the opposite, they can distract drivers, pedestrians and animals, and could cause accidents. Stop using them!

B.2427 February 26, 2023 — Loudon, NH

As an Optometrist, I have had a huge increase in patient complaints regarding the perceived brightness of newer headlights, and the dangerous effect on night driving.

B.2428 February 26, 2023 — Lunenburg, VT

I agree! It's a danger to everyone in the road with no real benefit for the driver.

B.2429 February 26, 2023 — Madison, OH

I've been completely blinded by these headlights. I think they should be banned EVERYWHERE. Absolutely NO reason why I should be blinded while driving, by another driver. Oh, and....the LEDs on police cruisers is JUST AS BAD.

B.2430 February 26, 2023 — Milford, OH

This is what government can do something about. This can measurably improve day to day life in the U.S.. There is an actual answer to this problem. It would be nice to see this tackled and unwinnable arguments/fights over issues like abortion (pro or con) tabled. Long enough to solve issues we can actually solve.

B.2431 February 26, 2023 — Mobile, AL

April Kasper

B.2432 February 26, 2023 — Montreal, Canada

Enough is enough!

B.2433 February 26, 2023 — Nashville, TN

This has been a problem for years now and seriously needs to be addressed! Many people just can't Drive after sunset anymore because of the newer and brighter lights. And if you're in front of a truck or keep, or suv that sits higher up, you may as well pull over and let them pass because you will be blinded if you don't. Time for a change and make it a law!

B.2434 February 26, 2023 — Nashville, TN

*jeep

B.2435 February 26, 2023 — Naugatuck, CT

I too am affected by being blinded by LED headlights. My vision while driving becomes such a hazard when a vehicle coming the opposite direction blinds me, which almost has me either almost hit the other vehicle or a sharp turn that causes me to go off road.

B.2436 February 26, 2023 — OGDEN, UT

I'm tired of being blinded. Afraid I'll end up in an accident because of it!

B.2437 February 26, 2023 — Phoenix, United States

The LED headlights are very blinding and there are to many running lights around the headlights and as hould reduced

B.2438 February 26, 2023 — Pollock Pines, CA

I'm tired of being blinded while driving at night

B.2439 February 26, 2023 — Portland, OR

I have a TBI (traumatic brain injury) from being hit head on by a drunk driver 15yrs ago. I have to wear sunglasses and a bucket hat almost 24/7 due to all of the LED lights from cars, many of which are painfully bright even in the daytime. Thats in addition to every other light in sight being swapped out for LEDs now as well, ex. street lights, buildings, buses, etc. I have to look at the ground when walking at night which puts me at risk for accidents, assaults, etc. I know I am hypersensitive due to my TBI but these lights are so far from natural I know that with time healthy folks will be having increased health issues. Already every person on the road is in danger as vehicles are in constant motion blinding them with LEDs from all different directions, angles, and heights. I remember getting tickets for leaving on high beams just 20yrs ago in cars where u switched em on with your foot. Today's running lights are brighter than those!!! How is this ok?

B.2440 February 26, 2023 — Portland, OR

I have had to stop driving at night (and on darker days!), I'm afraid for myself and others and think this is a major safety issue in our country!

B.2441 February 26, 2023 — Rahway, NJ

I'm so tired of being blinded at night. I used to live driving at night but more I dread it! Please fix these headlights!

B.2442 February 26, 2023 — Richmond, VA

It has become difficult and dangerous to drive at night.

B.2443 February 26, 2023 — San Francisco, CA

Not just the brightness level and color spectrum of these LED / HID lights but also the angle at which these are installed making a modern cars “lo-beam” act like a regular cars “hi-beam”. Add to this idiotic AI technology like automatic high beam, you end up with blinding cars in the opposite direction.

B.2444 February 26, 2023 — So. Burlington,, VT

the headlights are way too bright, and I cannot see if there is someone on the side of the road. I do not want to hit someone walking their dog because of stupid too bright oncoming hesadlamps, or a tree alongside the road on a curve.

B.2445 February 26, 2023 — Sophia, NC

Been "blinded" by these bright headlights especially when they are on taller trucks and suv. Also get blinded by emergency vehicles having blinding emergency lighting.

B.2446 February 26, 2023 — Tampa, FL

These lights are blinding and disorienting. Go back to yellow lights!!!!

B.2447 February 26, 2023 — Temecula, CA

I'm signing because I almost hit a motorcyclist while changing lanes at night. The car behind them had really bright lights and I couldn't't see the motorcycle. There's times I can't see the lines on the road. Also, it makes driving with astigmatism even worse.

B.2448 February 26, 2023 — Tisbury, MA

I want to see the stars

B.2449 February 26, 2023 — Traverse City, MI

Drive a small car and am light sensitive. Adaptive lights would be awesome and less painful.

B.2450 February 26, 2023 — Wakefield, MA

What has ever happened to DOT rules regarding automotive lights? Today's super bright blinding head lights are dangerous and are aimed too high off the road. Restore sane and reasonable headlight rules and save lives while not blinding oncoming traffic.

B.2451 February 26, 2023 — Winchester, MA

I was convinced people were just refusing to turn down their high beams, but this is worse. America has always been behind the rest of the world in headlight technology. It used to be that our sealed beams gave much less visibility than Europe's replaceable bulbs, but now our cars just spew blinding light. This is of a piece with giant pickup trucks that have head-height hoods to appeal to our reptilian brains, and at the same time mash the brains out of any pedestrians they hit. We need our laws updated to keep up with the marketing departments of the Big Three automakers.

B.2452 February 27, 2023 — Milwaukee, WI

Today a Lincoln Navigator was driving behind me. During the day with their high beams on. The light was blinding me in my rear view mirror and driver side mirror. I couldn't see to even drive. There needs to be some kind of regulation on these lights. I would think this new normal of brightness will blind people or we will have a lot more eye damage in the future for the young.

B.2453 February 27, 2023 — Reynoldsville, PA

I'm signing this because I can't count the number of times these bright headlights have almost made me drive off the road. I also have noted an increase in my headaches and migranes after driving at night and passing cars with these headlights, or having them drive behind me. I prefer the duller yellow ones, we could see and it doesn't kill my eyes to drive at night if they pass me by or are driving behind me.

B.2454 February 27, 2023 — United States

Blinding headlights are dangerous.

B.2455 February 27, 2023 — leitrim, Ireland

Since introduction of LEDs, I suffer from migraine, nausea, vertigo, difficulty concentrating, especially from excessively white blue LEDs. Also driving has become just about tolerable and a frustrating uncomfortable experience. I used to enjoy driving, now I avoid it.

B.2456 February 28, 2023 — Goodyear, AZ

Not safe to be as Bright as high beams...

B.2457 February 28, 2023 — Honolulu, HI

A lot of the newer headlights are blinding...

B.2458 February 28, 2023 — Lawrence, KS

the glare of oncoming lights is blinding at times. I actually have to block them with my hand in order to see the road!

B.2459 February 28, 2023 — London, United Kingdom

They are so dangerous and completely blinding

B.2460 February 28, 2023 — Loveland, OH

It's blinding and dangerous

B.2461 February 28, 2023 — Manhattan, IL

I'm getting blinded during the dark on way to and from work. I wonder how many people are killed in accidents caused by these lights. I noticed jeeps low beams are really blinding.

B.2462 February 28, 2023 — Marbury, AL

The new headlights are extremely dangerous I have almost wrecked several times from them blinding me. I suffer from migraines and I am very light sensitive already. They not only blind you as they are approaching but even afterwards all you can see a spots and your eyes which prevent you from being able to see to drive afterwards. I have to put my sun visor down and hold my hand up in front of my face to block the lights as I'm driving or sitting still even. Also not only the headlights but has anyone else noticed the tail lights and blinkers are terribly blinding as well when you're sitting behind a vehicle at a stoplight. I truly wish that they would pass a law Banning the LED headlights and tail lights, brake lights and blinkers! Including the colored ones, especially the blue ones! And mandate restrictions height and brightness with mandatory state inspections!

B.2463 February 28, 2023 — Portland, OR

These lights are literally blinding. I also heard cyclists are having more accidents bc of them - they can't see either.

B.2464 February 28, 2023 — hull, ENG, United Kingdom

It's dangerous!

March 2023

B.2465 March 1, 2023 — Ashburn, VA

I CANT SEE

B.2466 March 1, 2023 — Clarkston, GA

I certainly have this problem and never drive at night. Regular headlights are enough glare, no one needs to be blinded while driving.

B.2467 March 1, 2023 — Fairview Park, OH

Yes, thank you! I now have to wear sunglasses at night due to these LED headlights, making night driving even more dangerous!!! This is madness!

B.2468 March 1, 2023 — Houston, TX

I prefer to drive a smaller car as I am only one person and don't need to use a lot of gas. Lately it feels hazardous to drive at night when these taller vehicles's bright blue-wave headlights are in my eyes. Even after a brief flash, my eye sight is temporarily compromised and I am still seeing spots for 15-20 minutes. This cannot be good for our eyes. Many of us suffer from migraines as well, and this can absolutely trigger them.

B.2469 March 1, 2023 — Huntsville, AL

I can almost not drive at night because of blinding lights

B.2470 March 1, 2023 — Indianapolis, IN

I often wonder if drivers are using their bright lights that are causing a blinding glare. LED/HID don't help drivers see better and yet are dangerous in many ways. Regulation could save lives.

B.2471 March 1, 2023 — Newark, NJ

This is extremely dangerous and can cause accidents

B.2472 March 1, 2023 — Reynoldsburg, OH

I hate driving at night seeing everything alright, and some schmuck nearly causes me crash because of the dumb high beams!

B.2473 March 2, 2023 — Cape Coral, United States

Tired of unaware people driving rolling flash bangs

B.2474 March 2, 2023 — Columbia, SC

I'm signing because first of all, I care! And to be honest, my eyes are getting older too. These lights are blinding to many of us and very dangerous for that reason. Thanks for considering the facts.

B.2475 March 2, 2023 — Paris, IL

I commute to and from work. These lights blind travelers on interstates already going 80mph.

B.2476 March 3, 2023 — Lutz, FL

December 2022 I was run off the road, blided by their headlights(they were also in my lane) and ended up in a ditch with a $700 tow bill while they drove off into the night. Blinding headlights were the reason I couldn't see and swerved into the ditch

B.2477 March 3, 2023 — Mooresville, NC

I have, along with other people that I have talked to, also have complaints about these BLINDING headlights. I have suggested that we fail a lawsuit against these LED headlights. It's almost traumatizing, driving after the sun goes down or when its raining. I am afraid that I or someone driving in vicinity will wreck, causing serious bodily harm. Something need to be done, ASAP!!!!! Chrystal Flake

B.2478 March 3, 2023 — Rensselaer, NY

It is now extremely difficult to drive at night with the headlights coming at me. I drive an older taller minivan so it is not the level of my vision field coming into p,at, it is the new headlights.

B.2479 March 3, 2023 — bowling green, KY

I become completely blinded by oncoming LED lights and have to adjust all my mirrors when cars are behind me with LED lights. It has become very dangerous to drive at night because of these lights. I truly cannot believe that this is becoming the norm on new vehicles. I am in my 50's so I do have older eyes, but my 20-year-old daughter also has the same difficulty seeing in the same situations. It is even more overwhelming when driving on narrow 2-lane roads. I fear being on a narrow, unfamiliar road at night. I think they should be banned and manufacturers should be forced to recall and replace them on factory-issued vehicles. At the very least, stop rolling them off the production lines with these lights now!!

B.2480 March 4, 2023 — Modesto, CA

Saves lives I agree with the petition

B.2481 March 5, 2023 — Algonquin, IL

I have photosensitivity and astigmatism in both eyes. I seriously can’t drive for more than a few minutes without getting blinded and instantly dizzy. I come home with a mild headache at best every single time. It is VERY scary. How is this legal? I already have bad anxiety driving and this has made it x200 times worse. I’m so scared i’m gonna hit someone or something one of these days. PLEASE do something about this. It’s not just me. Too many people are having issues with it. Please take this seriously.

B.2482 March 5, 2023 — Bridgewater, NJ

Drivers are literally blinded when an oncoming vehicle is approaching AND after they've passed. And it's almost equally as distracting when LEDs shine in your eyes via the rear and side view mirrors. And so what are drivers reduced to doing in order to not be blinded? We look off to the side of the road when oncoming cars are passing, which of course is dangerous but at least we don't get momentarily blinded. We also adjust our mirrors to positions that aren't optimal so that we don't get blinded from behind. Note that I have absolutely no problem driving in the dark with warm toned halogen lights, even on country roads. But when I've driven cars with LEDs I find it harder to see long distance than with halogens. The eye is meant to adapt to low lighting, so a super bright light is counterproductive when trying to see in the dark. Halogens disperse light more naturally and the light slowly dissipates in the distance allowing for the eyes to adapt to the surrounding darkness, whereas LEDs create a stark bright/dark boundary where the light ends and everything beyond it is perceived by the eyes as pitch black and basically invisible. Not to mention that light/dark line is distracting when driving on hills. It's completely baffling that car companies are coming out with features that are supposed to make driving safer, such as lane assist and rear cameras, yet at the same time they install blinding LED headlights which pose much more dangerous consequences such as head-on collisions or running off the side of the road.

B.2483 March 5, 2023 — Bridgewater, NJ

 Way too many people on the road with their lights angled in the wrong direction. Sometimes when there's an oncoming car with high beams I'll flash my high beams to activate their car's automatic switch to low beam, or if they don't have automatic at least it reminds the other driver that they need to turn down their high beams.

B.2484 March 5, 2023 — Odessa, FL

I struggle to drive at night due to these headlights

B.2485 March 5, 2023 — Staten Island, NY

As someone with impaired vision which isn't an issue but I also have an astigmatism..all light's already look like little light explosions as..BUT LED lights!!..it LITERALLY burn my eyes ..and then having it reflect off the side and rear view mirrors is ABSOLUTELY TORTURE..GET RID OF LED HEADLIGHTS

B.2486 March 5, 2023 — Staten Island, NY

I constantly have to lower my driver side view mirror down just so I block out the light..and the rear view thank god has the little piece that I switch up which puts it in I guess like a reflective or somethin like that..but that works really good to block the lights but I'm able to still use the rear view mirror

B.2487 March 6, 2023 — Baltimore, MD

I wish I could share with lawmakers the view from my condo/high rise. Every few minutes at night a blinding light from an intersection 1.4 miles blinds me. If that level of bright light from an Led Car headlight can reach and disrupt from over a mile away, what can that be like for the person in front of them. I've tried recording it but my iPhone camera/video is terrible. I feel like it would be a great indicator of just how bright these lights are.

B.2488 March 7, 2023 — Jacksonville, FL

I am a human who drives and has eyes.

B.2489 March 7, 2023 — Philadelphia, PA

These blinding headlights are dangerous and should be outlawed

B.2490 March 7, 2023 — Silverado, CA

I have had to stop driving at night because of led headlights especially Pickups and SUVs

B.2491 March 7, 2023 — Summerville, SC

I can hardly drive at night anymore from these lights ruining my eyes.

B.2492 March 8, 2023 — Baltimore, MD

It's physical painful and emotionally exhausting to drive at night. Not only are the lights a sensory hell, they also are preventing me from seeing where I'm going. It's so dangerous.

B.2493 March 8, 2023 — New Albin, IA

I do not drive at night anymore because of the intense glare from these lights. It not only hurts my eyes it is extremely dangerous and there have been numerous accidents, injuries, and even deaths because of these lights. People over Profits!

B.2494 March 8, 2023 — Portland, OR

These lights are dangerous. I frequently get blinded at night and cannot see well for a few seconds. I can't jeopardize my family because of these unregulated lights

B.2495 March 8, 2023 — Reykjavik, Iceland

I live in Iceland and these bright headlights are terrible. They destroy our eyes and our environment. More and more cars have these bright headlights. I use sunglasses when driving in dark. The authorities are totally corrupt allowing these lights. They don't care about common people, they only care about big buisness.

B.2496 March 9, 2023 — Garden Grove, CA

Diminishing the nightvision of drivers leads to dangerous road conditions for all road users

B.2497 March 9, 2023 — San Francisco, CA

LED headlights are blinding.

B.2498 March 10, 2023 — Grand Blanc, MI

I wish they'd bring back affordable, easy to replace, glass sealed beam halogen headlights.

B.2499 March 10, 2023 — Halifax, Canada

Not yet convinced this is a problem? Check out reddit.com/r/fuckYourHeadlights to see photos/videos and read about experiences from thousands of people all over the world.

B.2500 March 10, 2023 — Smithfield, RI

Difficulty, danger and fatigue driving at night caused by blinding white LED headlights.

B.2501 March 10, 2023 — Terre Haute, IN

Needs attention.

B.2502 March 10, 2023 — Washington, NJ

This should be a no brainer. I cant believe anyone thought this was a good idea. Im tired of driving home from work, and essentially letting jesus take the wheel, because I cant see anything. The blinding light of a thousand suns burning right through my retinas causes black spots to appear in my eyes, so the blindness lingers much longer than the actual headlights. There was never a problem with the old headlights. I could see just fine before the blue lights came.

B.2503 March 11, 2023 — Mauldin, SC

I have eyes that are very sensitive to light and bright (especially white) things.. I honestly can’t see (low riding car) every single light shines right into my window. Hear me out okay, (I’m obviously not the only one who can’t see.) If someone could create having your brights on be the LED BS, then regular running lights be the warm yellow again (WHERE I CAN SEE AGAIN AND SEE PAST THE CAR AND NOT WONDER WHATS ON THE OTHER SIDE OF THE LIGHT WALL I’M LOOKING AT) I just feel like it wouldn’t just help me but a lot of other’s too.

B.2504 March 11, 2023 — Mauldin, SC

Y’all stay safe out there! Always try to be aware of ur surroundings ❤️ ❤️

B.2505 March 12, 2023 — Atlantic Beach, NY

Driving at night has become a perilous adventure, especially on winding roads. I am continually blinded by these high power lights and no longer feel safe.

B.2506 March 12, 2023 — Chennai, India

I drive too and am constantly blinded by high beam headlights at night which makes me freak out

B.2507 March 12, 2023 — Chennai, TN, India

I have many times been blinded by headlights and nearly run over someone

B.2508 March 12, 2023 — Cypress, TX

They blind me on the road. My wife almost ran off the road blinded by a truck with LED. She can't drive at night anymore. They also trigger her migraines. They are dangerous!!!! And affect people's physical health!!!!

B.2509 March 12, 2023 — Greenville, SC

They are ridiculous and unnecessary!

B.2510 March 12, 2023 — Rogers, AR

I have astigmatism and these headlights at night are so blinding and dangerous. The LEDs are not the problem, it's the glare — there needs to be some kind of luminance regulations put in place as this is life safety issue.

B.2511 March 12, 2023 — Somerset, NJ

Everyone I know, including me, are blinded by these headlights at night, making driving dangerous for everybody!

B.2512 March 12, 2023 — Williamsburg, OH

These are dangerous as they temporarily blind oncoming traffic creating a possible deadly situation.

B.2513 March 13, 2023 — Baltimore, MD

I suffer from migraines and can no longer drive at night without risking triggering a debilitating migraine.

B.2514 March 13, 2023 — Chicago, IL

The headlights are blinding and eye damaging. It's ABSURD. And who is really at fault when an accident occurs as a result of being blinded? Is the the fault of a driver or the manufacturers?????

B.2515 March 13, 2023 — Fresno, United States

I have experienced near crashes because of people either behind or coming towards me. I used to drive to work in the mountains where it is much worse.

B.2516 March 14, 2023 — Asheville, NC

Super bright LED headlights and accessory lights are not only a nuisance, but are also dangerous for the other drivers on the road. They not only cause a distraction when being confronted with them, but also when being approached from the rear. Please pass regulations to limit the brightness and color of what is acceptable for being on the road.

B.2517 March 14, 2023 — Attleboro, MA

I have TBI and it is extremely difficult and scary to drive with blinding lights coming at you.

B.2518 March 14, 2023 — Baton Rouge, LA

I don't want to be blind

B.2519 March 14, 2023 — Bogue Chitto, MS

Headlights are too bright and distracting. They are so bright that they are commonly used to blind other drivers on purpose.

B.2520 March 14, 2023 — Brooklyn, NY

I've been blinded by these newer headlights and almost crashed because of it. It's ridiculous we have got to this point.

B.2521 March 14, 2023 — Canby, OR

Blinding headlights are a massive safety hazard.

B.2522 March 14, 2023 — Haiku, HI

Im in my early 30's and I've done my best to stop driving at night solely because of the popularity of lifted vehicles with blinding lights. There are often times when I am so blinded that I can not see the road and I am driving off memory. The person blinding me is putting their life in my hands and they are doing it without my consent. It is insanity. I drive an SUV, I can only imagine how bad it is for people driving lower vehicles. And the truth is many 'lifted bright lighters' literally and metaphorically look down on people in smaller cars. It's Idiocracy.

B.2523 March 14, 2023 — Highton, Australia

I'm 45 my car is 2012 model these new cars have very very very bright leds headlights it is very very dangerous I find it very difficult to see it would be great if somehow the government could replace older headlights for a cheaper price for leds so we all can see for people in need it it is very dangerous

& scary something needs to be done just make them affordable on older cars without LED headlights just being honest it can be very scary

B.2524 March 14, 2023 — Indianapolis, IN

As an optician I have countless patients that complain about how these lights have made driving more difficult and more dangerous. The height of the lights needs to be addressed as well. Many of the trucks being sold today have headlights that are placed directly at eye level of anyone in a normal sized vehicle.

B.2525 March 14, 2023 — Rochester, IN

I drive home from work at night and I feel like my eyesight is getting worse due to being blinded every single night.

B.2526 March 14, 2023 — Stanfordville, NY

IT AGGRAVATES MY ASTIGMATISM!

B.2527 March 14, 2023 — Washington, DC

I live in an urban area and these are so unnecessary and dangerous on city streets.

B.2528 March 14, 2023 — Williamston, NC

I'm tired of being blinded for up to a minute by cars oncoming, one day it's going to cause me to wreck and hurt myself and my family

B.2529 March 15, 2023 — Dorset, ENG, United Kingdom

I can no longer confidently drive at night due to having very light-sensitive eyes.

B.2530 March 15, 2023 — Huntingdon Valley, PA

I have been blinded by new headlights

B.2531 March 17, 2023 — Fayetteville, AR

Because LED lights are illegal and I don't want to DIE. There will be death lawsuits if these blinding lights don't cease.

B.2532 March 17, 2023 — New Haven, CT

Wanda Faison

B.2533 March 18, 2023 — Austin, TX

They are so very dangerous.

B.2534 March 19, 2023 — North Tonawanda, NY

"The LEDs are not the problem...." NOOOOOO! Use your head! LED's *are* the problem!

B.2535 March 19, 2023 — North Tonawanda, NY

Inconsiderate individuals. That's the New Normal!

B.2536 March 19, 2023 — North Tonawanda, NY

I know EXACTLY what you are referring to! I see it all the time on my walk!

B.2537 March 19, 2023 — brooklyn, NY

Them shitsis too bright yo

B.2538 March 20, 2023 — Cibolo, TX

These lights has caused severe pain and migraines to myself and eleven year old son. The pain last for awhile after being blinded or waiting at a stop light. I'm a nurse and work nights. Just imagine that!!!

B.2539 March 20, 2023 — Littlehampton, ENG, United Kingdom

I no longer feel safe driving at night. I can't see properly with the blinding lights of other cars and this is curtailing my personal and family life.

B.2540 March 21, 2023 — Avondale, AZ

i'm only 22 and i had to stop driving at night as much as possible because of lights like this. i have astigmatism and driving with people who have bright lights on the road blinds me so bad. it's unsafe and our government needs to do something about it.

B.2541 March 21, 2023 — Mount Juliet, TN

These lights are unnecessarily bright making them an unsafe distraction on the road.

B.2542 March 22, 2023 — Brooklyn, NY

These headlights are a real nuisance, they leave a mark in your eyes that takes a few minutes to go away sometimes, and they're not necessary.

B.2543 March 22, 2023 — lehigh acres, FL

I CANT SEE! Literally. The New LED Headlights arent even on "High-Beam" and they're lighting up the whole inside of my car, blinding me, and now allowing me to see PAST their car On MY LANE. What if there was a pedestrian, or a stopped car on the side of the road. WE NEED A SOLUTION

B.2544 March 23, 2023 — Santa Rosa, CA

I have never had a problem driving at night until the increased use of blinding headlights became the normal. I cant believe I have avoided tinting my windows for 10 years (the sun is fine!) but am now considering it for the nigh-time?! No thank you. This is a real problem, and I cant imagine how it affects the visually sensitive or elderly drivers.

B.2545 March 23, 2023 — United States

I like to see at night

B.2546 March 24, 2023 — Orange, CA

These high intensity lights are dangerous to other drivers on the road

B.2547 March 25, 2023 — Tucson, AZ

I fucking hate those lights

B.2548 March 26, 2023 — Plymouth, IN

There is no reason for them light's to truly be that bright I truly have to stop just to make sure I'm staying safe and on the right side of the road

B.2549 March 26, 2023 — Royal Oak, MI

Screw these lights.

B.2550 March 26, 2023 — White Bear Lake, MN

I'm tired of almost crashing from being blinded by these awful things

B.2551 March 29, 2023 — Moorpark, CA

These lights are fucking ridiculous, they're literally brighter than the high beams on my car, and WHY THE FUCK are they always adjusted right at eye level? Aim them at the fuckin street not the fuckin moon!

B.2552 March 29, 2023 — Santa Monica, CA

I can't see when I drive at night any more cause these headlights are blinding.

B.2553 March 31, 2023 — Richmond, VA

I'm tired of being blinded by LED headlights at night! They are so distracting and dangerous!

April 2023

B.2554 April 1, 2023 — Lockport, IL

They come towards me and I can't see. Its awful i can't even see the road.

B.2555 April 1, 2023 — Richmond, IL

I like safe roads

B.2556 April 2, 2023 — Antioch, CA

I suffer from photosensitivity and optical migraines. The sudden blinding light in contrast to the dark surroundings is excruciating. It causes an uncontrollable flinch or squint. This translates to blurry vision, halos, and sharp pains. Headlights simply do NOT need to be this bright. A well focused light would not do this.

B.2557 April 2, 2023 — Denver, CO

I'm not trying to die on the road.

B.2558 April 2, 2023 — Morgantown, WV

When you get old, lights start to blind you. Well, regular car lights aren't a problem for me, but these LEDs are brutal. Especially on high-rise trucks, it's constant blinding even in my night-time rear view mirror, and in a hilly town I'm regularly expected to go over the top of the hill and take a turn while blinded. We have laws prohibiting using your high beams because they can blind people, and LEDs are BRIGHTER... why on earth are they legal?

B.2559 April 4, 2023 — Tampa, FL

I recently got stuck behind an ambulance whose brake lights were so bright they hurt my retinas and I had to look away from the road, endangering me and others. If they're getting so bright they cause retinal pain, this has become a national crisis. LED lights need to be banned on ALL external vehicle lights!

B.2560 April 4, 2023 — Wheaton, IL

light pollution is hazardous to everyone's health

B.2561 April 5, 2023 — Burnaby, Canada

I am tired of being blinded while driving by these headlights.

B.2562 April 5, 2023 — London, ENG, United Kingdom

My solution is to wear sunglasses while driving at night and memorise the road ahead for when blinded, but it is not ideal!

B.2563 April 5, 2023 — Portland, OR

These headlights are unnecessarily bright, and exceptionally worse when used in higher riding, or lifted vehicles. There needs to be more strict regulation.

B.2564 April 5, 2023 — Saskatoon, Canada

I hate being blinded by really bright headlights shining in my eyes at night. There needs to be a limit

B.2565 April 5, 2023 — Washington, DC

They are dangerous

B.2566 April 6, 2023 — Oakhurst, NJ

I avoid night driving whenever possible, as someone in a sedan, I am simply not able to see with these LEDs in my face. I have to pull over and wait for them to pass. And this is coming from someone with no vision issues whatsoever. These need to be regulated

B.2567 April 7, 2023 — Clinton, MD

I'm terrified to drive at night because the headlight situation is dangerous for me

B.2568 April 7, 2023 — Coldspring, TX

These lights impact my ability to see at night.

B.2569 April 8, 2023 — Gorebridge, SCT, United Kingdom

These lights blind me. I have to raise a driving hand to blank them off, which I hate doing since it's not safe.

B.2570 April 9, 2023 — Falls Church, VA

This is a significant and solvable problem.

B.2571 April 9, 2023 — Grand Rapids, MI

I have nearly gotten pushed off the road from drivers tailgating me at night. I have to pull over frequently and have intense headaches from driving at night. I've tried numerous expensive night driving glasses that do not help. I already have pre-existing light sensitivity and this has made life almost intolerable- I won't go out, go anywhere some days because I worry about dealing with eye strain and headaches. Some cars even have flashing lights that make me feel like I am going to faint. I also have ADHD and it's extremely difficult to focus. This is endangering us all. Please do something about this.

B.2572 April 9, 2023 — Oakdale, CA

I have developed a light sensitivity and LED lights absolutely hurt my brain.. it's very important to me to not have to buy these bulbs.. please lift the ban!!!

B.2573 April 9, 2023 — silver spring, MD

Im blinded by the lights.

B.2574 April 10, 2023 — Panama City, FL

I have worn glasses since I was 5, and I have blue eyes. My eyes are not super sensitive to light but these modern hid and led headlights are absolutely blinding. Making driving at night painful if not dangerous for anyone driving at them. As a hunter I can appreciate bright lights when off the main road but not on the roadway. Almost all streets are well lit these days with lights even being installed on the interstate at transitional areas for safety. No one needs lights this bright and if they do then maybe they should do what my grandmother does and do their driving while the sun is up.

B.2575 April 10, 2023 — Perth, Australia

I have astigmatism, which makes driving hard at night, even with glasses to aid me. Add in the LED lights on new cars, I avoid driving at night as much as possible as I don't want to go blind and cause of be in an accident

B.2576 April 10, 2023 — Portland, OR

So sick of overcompensating jerks blinding people at night and making the roads dangerous for everyone else.

B.2577 April 10, 2023 — new york, NY

LEDs are dangerous and harmful

B.2578 April 13, 2023 — Antioch, IL

Driving to work at 5 am it is always dark. I drive an older truck so the small cars lights do not blind me as badly but the new trucks on the road have those white leds, they are brighter than my conventional yellow high beams.

B.2579 April 13, 2023 — Ashburn, VA

almost caused soooo many accidents

B.2580 April 13, 2023 — Aurora, CO

I'm tired of being blinded by these types of headlights as I drive home every evening. Many times I cannot see the painted lines on the highway as they are so bright.

B.2581 April 13, 2023 — Bakersfield, United States

It's more dangerous to be blinded by the opposing traffic at night. The newer lights are painfully blinding and are worse than ever. They make night driving miserable and dangerous.

B.2582 April 13, 2023 — Baldwin, LA

I'm tired of being blinded by 1000 suns at night while driving anywhere.

B.2583 April 13, 2023 — Bath, PA

I'm a home health aid who drives far to work in the dark. I am concerned my eyes are being permanently damaged by the insanely bright lights of newer vehicles. I'm also worried I'm going to have an accident due to impaired vision. After a vehicle with bright lights passes me, it usually takes at least 15 seconds until I stop seeing spots and my night vision begins to return. During that time, I'm technically visually impaired. I'm really worried I'll hit a deer/animal or possibly drive off the road. I'm not old, only in my 30's. I go to the optometrist/ophthalmologist every year and I do not have anything wrong with my vision. It is simply a fact that vehicles are being made with excessively bright lights. There's also the issue of after-market lights which needs to be addressed. People using extra sets of bright lights, blue/colored lights, LED light bars, spotlights, etc. These ALL need to be regulated if they're approved for on-road use. Anything unregulated or not approved needs to be clearly labeled as "Off-road use ONLY" and give law enforcement the ability to enforce this as a matter of public safety. Years ago, part of yearly vehicle inspection was checking headlights. They used to make sure the headlights were adjusted properly so they weren't aiming directly into oncoming traffic. For some reason, this is no longer part of state inspection. It's especially important for SUVs, Jeeps and trucks to have their lights properly tilted downward, otherwise they are at eye-level of oncoming car traffic and will aim directly into those drivers' eyes. So there's several issues that need to be addressed: lights that are too bright, the color spectrum of headlights, regulation of lights and the ability to enforce these regulations, clearly labeling unregulated lights for "off-road use only" and once again making headlight specifications part of yearly vehicle inspection. There's a lot which can be done to address these problems. There are many ways we can make sure all drivers have good visibility. I hope now that you see what a big problem this is, you'll take the matter seriously and act on it. Please help make it safer to drive at night without the risk of damage to our vision and having accidents because of other driver's lights.

B.2584 April 13, 2023 — Bedford, TX

It's too dangerous for me to drive at night now due to the brightness of the headlights. Since headlights are no longer part of the inspection process for annual vehicle inspections it is only gotten worse.

B.2585 April 13, 2023 — Birmingham, AL

The amount of accidents I've narrowly avoided due to led headlights on vehicles like a Toyota camery is insane. This shouldn't even be an issue.

B.2586 April 13, 2023 — Colorado Springs, CO

I believe in this

B.2587 April 13, 2023 — Hatboro, PA

I'm SICK of blinding LED's in new cars! Especially Ford pickups with FOUR low beams!!!

B.2588 April 13, 2023 — Healdsburg, CA

Tonight, after being blinded by a jacked up truck across from me, both of us waiting for a green signal. I take my turn which there happens to be road construction on and hit some orange cones because I have big white spots in my eyes. I couldn't tell the difference of the lanes and when coming to another light I couldn't tell the distance between me and the car ahead of me. These lights are causing vision impairment to all drivers and the effects last several minutes. I had to pull over until those white spots faded enough to drive safely.

B.2589 April 13, 2023 — Healdsburg, CA

I believe it is causing eye damage. It's just like looking directly at the sun.

B.2590 April 13, 2023 — Huntingdon Valley, PA

I've been complaining about the bright lights since the halogens came out! Have had to hold my hands in front of my eyes and THAT is dangerous while driving!!!

B.2591 April 13, 2023 — IA, United States

I've HAD IT with these ******* LED headlights. I only drive in the dark now when I absolutely have no choice, which has completely destroyed my social life, family life, is risking my job, and puts my

life in jeopardy every time I meet these blinding DEVIL LIGHTS. My eyes don't just hurt after meeting them anymore, they hurt in the daytime as well now, after years of exposure. And I know I'm not alone. The NHTSA and the other government agencies responsible for this avoidable catastrophe owe me and the rest of us $$$$$ compensation for essentially destroying our lives. Everyone of us should start thinking about early retirement, cause some day these CRIMINALS are going to get sued for every dollar they have.

B.2592 April 13, 2023 — Irving, TX

Humanity need's to prevail over profits

B.2593 April 13, 2023 — Lascassas, TN

I'm light sensitive to begin with, and these obscenely bright headlights make it much worse.

B.2594 April 13, 2023 — Long Beach Township, NJ

These lights are blinding, dangerous & should not be allowed. Without regulations to prohibit, this is affecting so many people & causing so many accidents, even death.

B.2595 April 13, 2023 — Loveland, OH

LED headlights suck. I'd like to SEE when I'm driving.

B.2596 April 13, 2023 — Malvern, PA

I have been temporarily blinded by Led lights while driving, especially when it's raining.

B.2597 April 13, 2023 — NJ, United States

I don't want to drive with blindness, the blindness may only last a few seconds, but those few seconds can be a matter of life or death

B.2598 April 13, 2023 — New York, NY

I am sick of being blinded at night by these people with insanely bright headlights.

B.2599 April 13, 2023 — Ocean City, NJ

well, I thought I was just old, crazy or imagining things when I started complaining to myself about the bright lights...and cursing at drivers (windows closed)...moving my mirrors up down, in & out ...trying to actually SEE!...I have a difficult time seeing bicycles, pedestrians and the actual ROAD at times....and those damn high profile suv's and pickup trucks are HORRIBLE!...I don't know know if the owner's are aware of how dangerous their vehicles are, or even care? What makes me angry is the fact that if I have MY "brights" on to see, these drivers (of big brand new vehicles) signal me to turn my lights down! HaHaHa! I DO NOT COMPLY!! how do they like it!???

B.2600 April 13, 2023 — Olympia, WA

Many cars headlights are too bright

B.2601 April 13, 2023 — Philadelphia, PA

It's blinding and triggers migraines. Additionally, you can't see for a significant period of time after experiencing. This is a recipe for disaster!

B.2602 April 13, 2023 — Philadelphia, PA

I really can't stand those high lights on cars it's blinding and scary when u can see the road,especially for pol with night blindness,and if ur on a road that turns and winding,and head on..someone is going to get hurt or killed.

B.2603 April 13, 2023 — Pittsburgh, PA

I, too, am fed up with ridiculously bright headlights on cars at night. At first, I thought some people were driving with their high beams on, but then I thought to myself, it can't be this many people driving around with their high beams on at the same time. Too many times I have been blinded by oncoming traffic, which is extremely dangerous, not to mention, the interior of my car being brightly lit by the headlights on the car behind me while also being blinded by the flare in my rear and side view mirrors. How are these lights even legal? There's zero consideration for the safety of other drivers.

B.2604 April 13, 2023 — Shawnee, United States

Blinding headlights have been getting worse over the past several years. Blinding opposing traffic is unacceptable as it puts everyone in the road at risk.

B.2605 April 13, 2023 — Tillsonburg, Canada

Extremely dangerous - as a truck driver it greatly interferes with me driving safely on the big roads!!!

B.2606 April 13, 2023 — Toledo, MI

They need to outlaw fog lights when not needed as well

B.2607 April 13, 2023 — Van Nuys, CA

Safety should be the number one concern when driving. Headlights are bright enough when someone has their high beams on inappropriately, but the new "low" beams are too bright and are equivalent to the high beams.

B.2608 April 13, 2023 — Wildwood, IL

Edmund jorgensen

B.2609 April 14, 2023 — Albany, NY

There comes a point when energy savings or whatever reasons manufacturers are giving for using LEDs or for the safety of the driver behind those lights is negated by the Hideous Lack of Safety for oncoming drivers. Ask insurance companies how many claims there are for drivers who went off the side of the road because the road curved and the driver didn't because the driver was so blinded by oncoming LEDs they didn't see it. Ask insurance companies how many claims are for drivers who went off the side of the road because the driver flinched when suddenly hit with LEDs coming out of a cross street or driveway. I know several elderly people who will not drive at night, not because they have bad night vision, but because trying to drive safely while dealing with blinding LEDs is too high stress for their hearts. Blinded by the light makes for great song lyrics, but not for driving safety.

B.2610 April 14, 2023 — Bernville, PA

I have blue eyes which only compounds the problem..

B.2611 April 14, 2023 — Brooklyn, NY

The rent is too damn high...errr I mean the lights are too damn bright!!!

B.2612 April 14, 2023 — Clarksville, TN

Robert, Have your friends sign this petition and end this once and for all!

B.2613 April 14, 2023 — Glen Rock, NJ

The bright lights make it hard to see and create a dangerous condition

B.2614 April 14, 2023 — Gruetli-Laager, TN

Airport runway lights .. hideous

B.2615 April 14, 2023 — Guilford, CT

I have reduced visibility in low light. My eyes adjust slowly. These needlessly bright LEDs make it very difficult for me to see while driving at night especially in the rain with the reflective wet roads. It's unbelievably inconsiderate to blind others for your own minor visibility increase.

B.2616 April 14, 2023 — Haledon, NJ

It is very hard to see during night driving

B.2617 April 14, 2023 — Hamlet, IN

Denise Amendola

B.2618 April 14, 2023 — Hobart, IN

It forces me to look away until they pass which is unsafe. This has caused me a night life. I have given up driving at night unless completely necessary.. if you need lights that bright. We have always had

them. Called brights and every one knows you turn them off when another car is coming.. because it blinds them.. common sense for 100 years what the hell happened.

B.2619 April 14, 2023 — Houston, United States

Not only are headlights on trucks missmatched in hight for smaller cars but oncoming lights are too bright. Especially "blue lights" are too bright. It's not safe, there are time when you just absolutely cannot see the road. Police lights are also getting brighter it seems, along with construction workers flashing lights.

B.2620 April 14, 2023 — Indianapolis, IN

I don't know how many times I have had to pull over because I could not see due to the car blinding me. I thought maybe I'm just getting older and that's why it bothers me so but now I realize this isn't me it's the headlights getting brighter and brighter.

B.2621 April 14, 2023 — Jacksonville, FL

I have been blinded many times while driving at night and have limited my night driving because of it. It is so dangerous.

B.2622 April 14, 2023 — Lansdowne, PA

Safety first

B.2623 April 14, 2023 — Newark, OH

New headlights are way to bright. Most look like the high beams are on when they aren't

B.2624 April 14, 2023 — Philadelphia, PA

These headlight should be illegal

B.2625 April 14, 2023 — Roanoke, VA

If I can't see EVERY time a car goes by me, they should not have them. I've almost ran off the road several times because of those eyeball burning lights. It's bull. And I will run into you

B.2626 April 14, 2023 — Royersford, PA

The lights are blinding in these newer cars. It actually hurts my eyes to look at them.

B.2627 April 14, 2023 — Seattle, WA

Being blinded by high intensity light is no fun and is quite dangerous. This of us in lower sitting vehicles are particularly vulnerable. Plus, don't we have enough light pollution around us?

B.2628 April 14, 2023 — Tucson, AZ

I hace the same issue in arizona some hwadlights are soo over bright n blick the vision from seeing whats in front if uorcoming at you due to the hazardous brightness if their headlights

B.2629 April 14, 2023 — United States

Yes, headlights should be regulated by the Department of Public Safety for each State!

B.2630 April 14, 2023 — United States

Football stadium headlights are aweful.

B.2631 April 14, 2023 — Valley Stream, NY

Can't see at night with these blinding LED lights. Very dangerous.

B.2632 April 15, 2023 — Adairsville, GA

The lights blind me and also cause me to have migraine headaches. Not safe. Not good.

B.2633 April 15, 2023 — Ashland, OH

I have been in this situation many times! Its hard to see at night. These headlights need to be controlled

B.2634 April 15, 2023 — Auburn, WA

Ban these unsafe and obnoxious headlights, and pass hefty fines for a$$holes who put them on their vehicles.

B.2635 April 15, 2023 — Aurora, CO

These ultra bright headlights are a hazard to everyone on the road.

B.2636 April 15, 2023 — Bedford, TX

Some headlights are so bright you can "x-ray" flash the bones in you sheild hand trying to block em being 50k x brighter than noontime sunlight.. need welding goggles not to go blind from em...

B.2637 April 15, 2023 — Bloomington, CA

Adaptive headlights mean high beams come on if area is more hilly. We have streetlights, yet cars blind us all the time and drivers say it's the car putting them on. You don't have to use that feature, it's just lazy driving. Don't cause somebody else to crash into you and hurt your kids. Because you can't be smart enough when to turn on your high beams and not turn on your high beams, you will hurt yourself or others. If I'm on the sidewalk walking a I can see without high beams. Then you can see without high beams when driving. It's a huge problem in california too.

B.2638 April 15, 2023 — Bolingbrook, IL

Most people's headlights are aimed too high and too bright, blinding pedestrians and drivers alike.

B.2639 April 15, 2023 — Boston, MA

I have eye damage from head light glare

B.2640 April 15, 2023 — Carlsbad, CA

I've nearly crashed because of those things

B.2641 April 15, 2023 — Charlotte, NC

The bright headlights are very hazardous, leading to increased accidents and fatalities. I'm restricted from driving at night because of the bright headlights!

B.2642 April 15, 2023 — Charlotte, NC

I agree that this problem has to be corrected

B.2643 April 15, 2023 — Chatsworth, CA

I can no longer drive at night because of the new headlight. So dangerous

B.2644 April 15, 2023 — Chicago, IL

I shouldn't have to wear my sunglasses at night to drive o

B.2645 April 15, 2023 — Chicago, IL

It's not just headlights, it's also blinding LED Brakelights when you're behind a car with those at a stop light. I keep seeing them more and more

B.2646 April 15, 2023 — Cincinnati, United States

I'm an OTR truck driver and it's worse than ever on roads at night. Plus ever since I had covid, my eyes are super sensitive to light. People don't realize that they are blinding other drivers and create a huge opportunity for accidents that can kill people.

B.2647 April 15, 2023 — Cincinnati, United States

I have a strip of red LED lights taped above my drivers seat in my 18 wheeler that I turn on at night. It helps reduce the effects of bright lights from other vehicles. Not 100% but it does help.

B.2648 April 15, 2023 — Colorado springs, CO

I have a light sensitivity and work nights, I have to turn my rear view mirror up and wear tinted lenses to drive without being blinded. It isn't just brighter lights, but people running with more than two forward facing lights or with brights/fog lights on as well.

B.2649 April 15, 2023 — Conover, NC

I drive a compact car and whether behind me or coming toward me, I am blinded by these ridiculously bright lights. They are dangerous and need to be regulated.

B.2650 April 15, 2023 — Coon Rapids, MN

I literally have to wear tinted safety glasses to drive at night.

B.2651 April 15, 2023 — Dacula, GA

A few months ago I was driving home from work - an easy 14 minute drive on back roads at the time. There is one turn where I needed to see both ways before turning as there is no light there. It wasn't even dark yet. The truck behind me had lights on that were so bright I literally couldn't see to my right AT all. I literally had to make the turn hoping there was no one there. Luckily no one was there but in my life I've never wanted to stop my car, get out and address the driver of a car so badly before in my life.

B.2652 April 15, 2023 — Dallas, TX

I'm a trucker . Those headlights are dangerous at night, especially on 2way roads. They are so bright that they block 75% of my road vision. Get rid of them asap before I have a wreck and possibly kill someone or myself.

B.2653 April 15, 2023 — Detroit Lakes, MN

I hate bright headlights

B.2654 April 15, 2023 — Dothan, AL

Headlights that are currently being used are excessively bright. They make driving in hours of darkness much more dangerous as they eliminate the ability to see anything other than the light.

B.2655 April 15, 2023 — Escanaba, MI

I found this petition/drive on the CITIZEN FREE PRESS news aggregator website. Finally! LED headlights are a curse! Horrible! I avoid nighttime driving as much as possible for this reason. Beware: It is the normal course for government regulatory/safety agencies to be bought off and OWNED by the very industries they "regulate." Let's do this! Thank you, organizers!

B.2656 April 15, 2023 — Evansville, IN

It's blinding. The lights are so bright and blinding I can't watch the road because I can't see anything but the glaring lights!

B.2657 April 15, 2023 — Franklin, NY

Those headlights make it hard the on coming traffic to see as well. This is why we have high beam and low beam, but the low beams are brighter than the high beams with these bulbs, it's ridiculous!

B.2658 April 15, 2023 — Gainesville, FL

I often have to look away from oncoming traffic -- even during the day -- because of overly bright headlights. The new super bright headlights are a dangerous safety issue.

B.2659 April 15, 2023 — Gastonia, NC

I am literally left blinded and CANNOT see when those obnoxious trucks with their idiotic led lights get behind me. Those bright lights can easily cause an accident and cause long term eye issues.

B.2660 April 15, 2023 — Goldboro, Canada

I have been blinded often by brilliant oncoming headlights, mostly on the 'redneck style trucks'.

B.2661 April 15, 2023 — Grand Junction, CO

It's nice to see when you need it but not at the expense of oncoming traffic. We need to limit the lumen concentration or wavelengths somehow.

B.2662 April 15, 2023 — Hartsburg, MO

I am blinded by the brightness of the led lights on vehicles. Can’t drive at night because of it!!!

B.2663 April 15, 2023 — Haubstadt, IN

This is a real concern for my husband & myself. There should be regulations on something that blinds you while driving.

B.2664 April 15, 2023 — Independence, MO

All blinding light needs to be addressed, period! I chose to sign this petition as I've been personally affected and have known others to be affected. I feel more lives can be saved from horrific traffic accidents if limitations are imposed.

B.2665 April 15, 2023 — Indialantic, FL

I hate blinding lights because they are dangerous and annoying!

B.2666 April 15, 2023 — Latham, NY

Everyone is safer with less blinding lights.

B.2667 April 15, 2023 — Lehighton, PA

I agree that this is dangerous. It's ok that your lights are so bright that it causes a shadow of my car and you can see great but everyone else is blinded by your bright headlights and can not see safety to drive. How is this safe?

B.2668 April 15, 2023 — Lorain, OH

There's a special place in hell for people who drive vehicles with LED lights.

B.2669 April 15, 2023 — Medford, NJ

If you need extremely bright headlights while driving through neighborhoods or town streets, you are driving too fast. These lights are blinding to other drivers and pedestrians and encourage excessive speed at night

B.2670 April 15, 2023 — Melbourne, FL

These are blinding lights at night and makes it hard to see the road before and after the vehicle passes by!

B.2671 April 15, 2023 — Midlothian, TX

The lights are too bright to oncoming drivers, even on low beam, especially on two lane roads!

B.2672 April 15, 2023 — Moultrie, GA

I'm signing because I don't think anyone needs to see up a junebugs butt a mile down the road,these LED LIGHTS blind you and I'm sure are the cause of many accidents

B.2673 April 15, 2023 — Nashua, NH

I'm signing because this has started to affect me at 41 years old. I find that it takes almost a full minute to recover from being blinded and on the twisty back roads of New England, this is incredibly dangerous.

B.2674 April 15, 2023 — Newtown, PA

Constantly blinded by hrad lights

B.2675 April 15, 2023 — Oak Lawn, IL

These lights are totally unnecessary and dangerous.

B.2676 April 15, 2023 — Olympia, WA

I hate them, and it should definitely be illegal.

B.2677 April 15, 2023 — Omaha, NE

Drivers in my state - NE - consistently drive with their brights and or multi-stscked LED vehicles... I frequently can't even see the right side of the road to look away from the glare... and have to drop my speed to maneuver on out tight or curved roads...

B.2678 April 15, 2023 — Orlando, FL

I don't feel safe driving at night in fear that I may hit someone, cause an accident or drive of the road into a ditch because these lights are so over powering. I literally have to look down onto the white or yellow lines to the right side and even then I'm nervous, blinded and scared. So have to do everything before the sun set completely out here where I live. It really sucks because I have to tell my kids that I can't take them somewhere or pick them up from somewhere after a certain time because of these blinding lights. And even when I flash mine as to kindly signal them to dim their lights while close to cars coming close they completely ignore it. It's frustrating.

B.2679 April 15, 2023 — Philadelphia, PA

I cannot drive at night due to bright headlights

B.2680 April 15, 2023 — Pittsburgh, PA

This is a very dangerous problem. It's the ultra bright lights that blind oncoming traffic. Absolutely NO need in headlights being this bright!

B.2681 April 15, 2023 — Pittsburgh, PA

I do this exact thing on longer trips. I put my sunglasses on. I have to as to not be blinded!

B.2682 April 15, 2023 — Ponca City, OK

At night I get blinded regularly when I drive. While there is an incoming car I can only see the road and if a deer jumped out which happens often around here I'd probably be a fatality myself.

B.2683 April 15, 2023 — Proctorville, OH

I can barely see to drive on two-lane roads at night because of these lights! I fear I'm going to hit someone head-on!

B.2684 April 15, 2023 — Rutland, VT

The lights are blinding even in the day time-in the daytime it’s like the sun hitting your eyes.

B.2685 April 15, 2023 — Saginaw, MI

I'm a glass wearer with very thick lenses and an astigmatism. Even with my lenses shaved, anti-glare, etc. I'm still blind at night, especially if it's raining on newly paved streets. It's not always just the incoming traffic either. Sometimes my rearview and sideview bounces the light of the person behind me. At that point I'm sucking the light just to see my lines. It's horrible and had become more and more difficult to drive over the years.

B.2686 April 15, 2023 — San Jose, CA

I almost crashed once because the other car had custom lights misaimed. It was pitch black, raining and there comes the blinding sun, the whole road disappeared; I put my high beams on to see, he did the same blinding me way more.

B.2687 April 15, 2023 — Sandpoint, ID

Too many times I've seen accidents because of excessive bright headlights! Seems regulation is the only option.

B.2688 April 15, 2023 — Seabrook, TX

I thought it was just me.

B.2689 April 15, 2023 — Seymour, United States

I have been driving a semi for 28 years and the past 15 years it is crazy to see how many people have these blinding lights. Jeeps and pickups are the worst. Especially if they're hauling anything on a trailer or in the back.

B.2690 April 15, 2023 — Spring Valley, CA

I have to drive at times late at night. This has almost caused me to get into car accidents a number of times! I have been a licensed driver for 44 years. This was never an issue until the past 15 years or so.

In the past ten it has increased enormously! I don't like driving at night due to this. It has to be corrected now!

B.2691 April 15, 2023 — Springfield, MA

It's extra frustrating, especially in a small car, to have super bright white lights making it so that I can't see what's coming up on my left or right when I'm on the highway. So much of the population lives in well lit cities anyhow, wer don't need the standard bulbs to be brighter than what the brights used to be.

B.2692 April 15, 2023 — TX, United States

I have to stop until they pass me. Otherwise, I can't see what's on the road when the lights are heading in my direction. Street lights are very dim and makes driving with incoming bright lights a hazard.

B.2693 April 15, 2023 — Tinley Park, IL

Blinding

B.2694 April 15, 2023 — Toms River, NJ

Justine Ward

B.2695 April 15, 2023 — Tustin, MI

I have green eyes. This means light at night is 100% harder on them. The fact of the matter is I think these "better" headlights are causing more crashes especially with deer. If a deer is blind they are going to be disoriented thus it's more likely to run into the thing blinding it.

B.2696 April 15, 2023 — United States

They are bright and high. They need limited. New tech should not take so long to be adopted in the US.

B.2697 April 15, 2023 — Valencia, United States

Combine the lights with interment divisors on the highway and your have yourself frequent high intensity flickers that take several seconds to clear from your focus. Very dangerous.

B.2698 April 15, 2023 — Victorville, CA

I am tired of being blinded. I've almost had numeraccidents because I can't see and then people turn their high beams on too. When driving in the city, there is no need for high beams.

B.2699 April 15, 2023 — WOODBRIDGE, VA

Modern headlights are as bright as welding arcs. There are times that my vision is impaired from a mile away. Close your eyes for 10-15 seconds the next time you're driving and see if you feel safe. Sometimes I wear sunglasses to drive at night.

B.2700 April 15, 2023 — Weare, NH

It's about time Someone does something about these headlights

B.2701 April 15, 2023 — West Fargo, ND

Getting blinding, glaring light in my face while night driving is terrible

B.2702 April 15, 2023 — Williston, VT

I used to LOVE night driving. But now, it is a near-constant barrage if absolutely blinding lights! Each time, I swear the incoming driver has his/her brights in. But no! These outrageous, ludicrously dangerous lights have caused several close calls lately. I am completely astounded these blinding lights were EVER considered safe for automobiles. And side from the sheer terror of being blinded and getting into an accident, there is now the added concern to one's eye health long term. Outrageous! Stop the assault on night drivers!!!

B.2703 April 15, 2023 — burlingame, CA

These new headlights blind me while driving. They are like highbeams but aren't. Florescent should be reserved for police officers. They scare me because I can not see ahead of me and fear one day I will hit someone.

B.2704 April 15, 2023 — mccomb, MS

This petition is long overdue. The aftermarket blue headlight need to he included in this petition

B.2705 April 16, 2023 — Arvada, CO

I am literally looking to leave a job that I absolutely love because I am having so much trouble seeing against on-coming headlights on the highway I have to travel. Because I work 10-hour days, I cannot adjust my travel times so that I both go to and come from work in the daylight. I have no choice but to drive in the dark either going to or coming from work. I drive 20.5 miles each way to get to work, and the highway I travel has several very narrow areas where there are really sharp curves. I get held up at least twice a week by accidents where other people have either hit each other or run into one of the concrete barriers in these areas because they can't see any better than I can against people's blinding headlights. I know it is only a matter of time before I am the one in one of those accidents.

B.2706 April 16, 2023 — Bangor, ME

Some of these lights are too blinding and I have nearly gone off the road multiple times and to a new driver this could be fatal really quickly.

B.2707 April 16, 2023 — Bismarck, ND

It's nice of NFL stadiums to donate their lighting banks to people in need of headlights, but it is so unnecessary

B.2708 April 16, 2023 — Boulder Creek, CA

Light sensitivity without brights on, including all types of color

B.2709 April 16, 2023 — Bremerton, WA

After driving in the night and getting blinded so much as I drive a Honda fit, i see long light tendrils and can hardly drive at night anymore. Being so low to the ground there is literally no escape from assholes with super bright lights. I'll try to slow down but often times they just ride my ass and blind me more. I've been in cars with these lights and often times the driver cares very little for the people in front of them and will not pass because they would rather do the blinding than get some soft light in there eyes. This is a medical danger and needs to be addressed. Instead of making new arbitrary rules just to fine us, can you make a rule to save us. I'd have a number on speeddial just to report assholes like this and gladly call it because it's common sense and it's entirely on the driver to ensure that everyone can drive safely on the road.

B.2710 April 16, 2023 — Broomfield, CO

These lights present dangerous conditions for all those who encounter them while driving, bicycling or walking. Finally, this issue can be addressed!

B.2711 April 16, 2023 — Bumpass, VA

Ford trucks have 2 sets of headlights all the time. Very dangerous to be blinded on the mountain road I drive on every day. Please ban Ford trucks double headlights

B.2712 April 16, 2023 — Bumpass, VA

Ford trucks have 2 sets of headlights all the time. Very dangerous to be blinded on the mountain road I drive on every day. Please ban Ford trucks double headlights

B.2713 April 16, 2023 — Burns, OR

Blinding lights.

B.2714 April 16, 2023 — Clarksville, TN

Arien, Send the lights home for friends to help them sign this petition to get the right position to get to do so please

B.2715 April 16, 2023 — Detroit, MI

Yes!!!!I'm soon happy to see this I'm an uber driver and have been dealing with this problem for a few years now to the point where I even had to stop driving at night because it's just too difficult to see.i

thought there was already laws in place for this but ether way I'm just so glad someone is finally talking about it.

B.2716 April 16, 2023 — Duvall, WA

these led lights are not directional. they spray light out in all directions, whereas previous HID and projector-type headlamps had far better control of where the light goes. also, ban the automatic high beam feature, it doesn't work!

B.2717 April 16, 2023 — EAST CANTON, OH

I am naturally light sensitive due to my eye color and genetics. It is a very common problem that people suffer through and many are unaware that they are light sensitive. This has been an issue that has made me quit my job due to night drives home. I also feel that all lights should be at a standard height on all vehicles as that is ignored as well. Different heights of lights can sometimes be directly in drivers eyes due to manufacturer or after market designs.

B.2718 April 16, 2023 — Elizabethtown, PA

I hate them lights

B.2719 April 16, 2023 — Estacada, OR

Hell yeah!! I'm always complaining about this, thanks for taking a stand ☒. Especially when it's dark and rainy I often have to drive by looking at the passenger side lane line as to not be blinded!

B.2720 April 16, 2023 — Evansville, IN

As a grubhub driver, I drive at night alot. There are times I nearly have to come to a stop when passing cars with said headlights because I am blinded. I never know anymore if someone has their brights on or they just have obnoxious headlights.

B.2721 April 16, 2023 — Fontana, CA

I hate the blinding lights and every time i drive at night I have to adjust my mirrors as they become useless with the newer lights

B.2722 April 16, 2023 — Fort Lauderdale, FL

Sick of being blinded at night on the road!

B.2723 April 16, 2023 — Franklin, NC

These lights are a hazard to everyone

B.2724 April 16, 2023 — Fremont, CA

blinding headlights are unsafe and cause accidents and kill people!!

B.2725 April 16, 2023 — Fullerton, CA

I hate those overbright headlights! I drive up/down the state on I-5 and those headlights make the trip awful!

B.2726 April 16, 2023 — Gardnerville, NV

I drive significant miles and these lights present a wide range of risks including dangerous shadowing from behind and blinding from the front. They should be outlawed

B.2727 April 16, 2023 — Geneseo, NY

Brighlights are very blinding and dangerous. Whether you are driving a car or a truck. Just because people can't see animals in the dark, let's just blind everyone cause you are a moron. Emergency vehicle's should have bright lights, not a moron who wants to blind people. Thank you fir this petition.

B.2728 April 16, 2023 — Grand Saline, TX

The new headlights are very blinding & dangerous, especially the jeep products. Makes me want to take a ball bat & bust everyone of them out. But unfortunately, it will take a higher up "important person" to be affected by this issue to get anything changed.

B.2729 April 16, 2023 — Guelph, Canada

Risking lives to save a little bit of energy by allowing LED lights is disgusting. In winter they get covered with frozen slush and do not generate enough heat to melt the snow so you can't see the car.

B.2730 April 16, 2023 — Hialeah, FL

I live in a big city plenty of light. People drive around here with flood lights and bars like they are driving on country dirty roads. It's out of control.

B.2731 April 16, 2023 — Highlands, TX

I travel roads near me that have no sidewalks and deep drainage ditches. bad headlights, blind me, so if someone was walking on the road, I would not see them.

B.2732 April 16, 2023 — Honolulu, HI

Whether they're shining into someone's eyes head-on or into their mirrors from behind, sacrificing one person's ability vision in order for another to see better makes the road more dangerous for everyone, not safer. Adaptive headlight systems are not enough. It will take decades to get all of the vehicles that endanger other drivers with their blinding lights replaced. There needs to be comprehensive Federal DOT action forcing massive recalls to replace the headlight assemblies of cars currently on the road, and legislation to enforce it. Laws are supposed to protect the public good, and safe roads are about as ancient and essential a public good as it gets.

B.2733 April 16, 2023 — Huntersville, NC

In the rain, with the new led headlights, it's near impossible to see the lane lines.

B.2734 April 16, 2023 — Jacksonville, FL

I'm sick of being blinded in a city and state full of red neck trucks.

B.2735 April 16, 2023 — Jeffersonville, IN

Those head lights blind me too

B.2736 April 16, 2023 — Joliet, IL

Its horrible at night to be blinded by theseclights

B.2737 April 16, 2023 — Kansas City, MO

This happens to me everyday blinding lights in my eyes and in my rear view mirrors. I hope we can facilitate some kind of change.

B.2738 April 16, 2023 — Katy, TX

Any driver who is blind enough needing a blinding stadium projector to be able to drive is a dangerous driver and should be banned from driving. The vehicles having such headlights should also be banned. They are no good except causing dangerous and possibly fatal collisions. Sadly the count is rising. Please stop this non sense.

B.2739 April 16, 2023 — Katy, United States

The lights are so bright sometimes I can't even see if front of me. I have to turn the tear veiw mirror down and sometimes that doesn't even help! Also, I've noticed even people with older cars are now driving with their high beams are. And the big trucks woth their bright lights are very bright! This is crazy!

B.2740 April 16, 2023 — Laramie, WY

My car is a 2000 Ford car. The second those lights show up the lines disappear for me. Almost killed me multiple times actually got me pulled over once

B.2741 April 16, 2023 — Las Vegas, NV

My eyes are very sensitive and the newer headlights look like someone has their brights on. It's bad no matter what size vehicle I'm in, whether it sits high or low

B.2742 April 16, 2023 — Los Angeles, CA

These lights are killing us!

B.2743 April 16, 2023 — Los Angeles, CA
BRING THIS TO LA!

B.2744 April 16, 2023 — Los Angeles, CA
It is getting ridiculous.

B.2745 April 16, 2023 — Manlius, NY
I can't see while driving into these bright lights

B.2746 April 16, 2023 — Marietta, GA
Automatic high beams may be great for the drivers who own them, but they blind me when they come at me in my car. They're supposed to dim when another car is near, but they don't see my low-beams until I'm already blinded. These things create a hazard for other drivers and should be illegal.

B.2747 April 16, 2023 — Marietta, GA

B.2748 April 16, 2023 — Miami, FL
Yes! They neeed regulation, as much as high beams are…

B.2749 April 16, 2023 — Middletown, DE
Glad to hear I'm not alone in my frustration. I fear the truck companies will lobby against any action to restrict headlight glare caused by vehicles that are too high

B.2750 April 16, 2023 — Mohrsville, PA
I hear from many older people that the white headlights cause a temporary blindness from the newer headlights. Takes a few seconds to readjust their vision. It does the same to me. That few second adjustment could put a person off the road or into another vehicle. The old yellow color lights didn't have that effect. I feel the newer white headlamps are a hazard to driving because most vehicles don't have them adjusted properly. The dam lights burn into your brain. Don't know how the white lights can be deemed safe for use on the highways. They need to be banned and go back to the old yellow lights. Much safer.

B.2751 April 16, 2023 — Mount Pleasant, MI
I'm tired of being blinded driving at night.

B.2752 April 16, 2023 — Niles, OH
Those lights are ridiculous and turn me into a blind angry driver - instantly.

B.2753 April 16, 2023 — Ottawa, Canada
Chantal Gagne

B.2754 April 16, 2023 — Pataskala, OH
Contrary to the IIHS argument that LED lights are safer and pose no safety hazard (when properly aligned) many of us find these lights to be dangerously blinding. They not only sometimes pierce one's skull but they wash out the road making it impossible to see the driving path. Even from behind they are obnoxious. The IIHS is not asking the right questions and their defense of these lights, ad an organization funded by insurance companies, is suspicious.

B.2755 April 16, 2023 — Pelion, SC
It's absurd that it's totally legal to blast blinding light into people's eyes while they're driving.

B.2756 April 16, 2023 — Philadelphia, PA
I had a brain surgery a few years back. It is extremely difficult to see at night time due to the bright headlights. My community gets very dark and yet people are speeding with high beams on unnecessarily. The trucks and tow trucks are a major problem too. Rushing for work with these bright lights completely covering the vehicle. Someone is going to get hurt if nothing is done about it.

B.2757 April 16, 2023 — Plainfield, NH

I would like night driving to be safer

B.2758 April 16, 2023 — Plano, TX

Driving at night has become dangerous. My family is tired of hearing me complain about being blinded by oncoming traffic. Seems like it started overnight. Don't remember it being a problem before lockdown but after a couple of years WFH I started driving at night again and that is when I noticed the problem. I can't tell if everyone is driving with their bright lights on or not. When I can look it seems multiple bulbs are lit up in each lenses assembly. Whatever the cause it needs to stop. I can't believe the people who build cars and the government employees who are responsible for highways are immune from experiencing headlight blindness's themselves. Somebody in a position of authority needs to recognize the problem and take action.

B.2759 April 16, 2023 — Poolesville, MD

The lights have gotten just too damn bright.

B.2760 April 16, 2023 — Potsdam, NY

i think it is unfair to allow cars and trucks with powerful led lights. I cannot see and most people with such led lights have no respect for other drivers.

B.2761 April 16, 2023 — Reston, VA

I drive a Honda Accord, and I am blinded more and more by those SUVs with ultra bright headlights, to the point that I will only drive at night if I have to!! It's especially bad on turns when those lights hit my side view mirror!

B.2762 April 16, 2023 — Rhinebeck, United States

Headlights are too high on large vehicles. Too many people drive with their high beams on.

B.2763 April 16, 2023 — San Jose, CA

Headlights nowadays give me a headache. Way to bright, super white, causes me migraines and eye pain

B.2764 April 16, 2023 — Santa Clarita, CA

I drive a low car & makes me insane when the majority of cars around me blind me! I'm lower than most, so I'm constantly adjusting my mirrors when driving or stopped simply so I can focus on the road! Not safe at all, especially with so many rude drivers these days. I do not drive slow, but I'm in a charger, so winding roads are a huge issue. It's terrifying to be driving on winding mountain 1 lane roads with some jerk close behind me until I'm able to pull over, with their lights completely blinding me. So many more instances that I could go on about, but I'm sure everyone here already knows them.

B.2765 April 16, 2023 — Schenectady, NY

Very blinding at night, which is hazard.

B.2766 April 16, 2023 — Seabrook, United States

I'm blinded by the liggggggghttttttt! I seriously can't see driving down my main road home at night, oncoming cars lights are too bright to see the road ahead.

B.2767 April 16, 2023 — Seattle, WA

Back in the late 80's you could not run off road lights because they were dangerously bright. Today's lights are even brighter. We did fine with the lights 20 years ago. Tighter lights only help to blind oncoming drivers.

B.2768 April 16, 2023 — Sewell, NJ

There have been times where the bright white LED headlights are so bright that I struggle to see the lines and road. As someone with glasses, it sucks worse when they are slightly smudged too.

B.2769 April 16, 2023 — Spring, TX

This is a real problem! These blinding headlights trigger excruciating and debilitating migraines!

B.2770 April 16, 2023 — Stevensville, MD

I am constantly blinded by these!!!! So dangerous!

B.2771 April 16, 2023 — Taylor, MI

I'm tired of being blinded by these ridiculous headlights.

B.2772 April 16, 2023 — Tuckerton, NJ

They are easy targets for law enforcement, so let's enforce some laws.

B.2773 April 16, 2023 — Turlock, CA

I'd like to be able to drive safely at night without being blinded.

B.2774 April 16, 2023 — Unadilla, NY

I find many led style headlights to be obnoxious. That includes the OEM's. I believe it is very dangerous. When the one year old vehicle behind me using his low beams is casting a shadow of my vehicle in my high beams, its gotten out of hand.

B.2775 April 16, 2023 — Union City, CA

Bright headlights are dangerous.

B.2776 April 16, 2023 — United States

It is unsafe.

B.2777 April 16, 2023 — United States

They are nothing but painful!!!!

B.2778 April 16, 2023 — United States

Bright light do affect night drivers negatively, especially when the vehicle is behind you. It prevents you from seeing anything in rearview or side mirrors, and is prevents visual focus ahead (in front of) your vehicle due to the blaring lights that overwhelm vision; it's like the equivalent of looking directly at the sun - which any human should know is dangerous for the health of their eyes. If you flip your center rearview mirror, you still won't be able to escape it because the effect is also on your side exterior mirrors, if the vehicle remains behind you.

B.2779 April 16, 2023 — United States

Sonia yanez

B.2780 April 16, 2023 — Valencia, CA

They're blinding and a trigger for migraines!

B.2781 April 16, 2023 — Valencia, PA

I would like to start by saying, I am a good driver. I am always respectful of others on the road. My biggest complaint is the glare from bright headlights! They are so bright that I can't see the road. There have been many occasions where I had to slow down or almost come to a complete stop, because I can not see the road. These bright lights are dangerous, and are going to cause an accident. It's also blinding when they are in your rear view mirror! I have to flip my mirror up, so I can see to drive. And I have to put my hands in front of my side mirrors to block the bright light. There are high beams on cars for a reason, you can turn them off so your not blinding other drivers. I avoid driving at night because of the bright lights. I'm afraid one of these days I will end up in an accident because I'm being blinded. I hope this petition proves useful, the lights gotta go!

B.2782 April 16, 2023 — Valparaiso, IN

I found that wearing glasses that reduce blue light make a difference. It doesn't appear that way at first, but driving seems easier after a while. Look for glasses to cut down blue light emissions from computer monitors. Good luck!

B.2783 April 16, 2023 — Valparaiso, IN

I wrote my Congressman, both Senators, and the NHTSA about this issue back in December 2021. I'm tired of being blinded in my compact car. I have found that glasses that are typically used to cut down on blue light emissions from computer monitors seem to help when driving. But it really shouldn't have to come to having to use something like that!

B.2784 April 16, 2023 — Vincennes, IN

This has been a problem for years. I thought it was just because I'm getting older. I'm 40. We the people need to stand up!

B.2785 April 16, 2023 — Vonore, TN

I hate blinding lights. Get rid of it!

B.2786 April 16, 2023 — WA, United States

I work solely at night and I'm tired of being blinded my whole commute. Sometimes I have to even close my eyes because the lights are THAT bright

B.2787 April 16, 2023 — Watervliet, NY

I already have astigmatism and these lights make it dangerous for myself and others to be driving at night.

B.2788 April 16, 2023 — Whittier, CA

Please help us with this nonsense.

B.2789 April 16, 2023 — Winder, GA

So glad to see someone is trying to do something about this. These outrageously bright headlights make driving at night very difficult. Even the bright LED lights indoors are causing many people problems. My daughter is having to quit her job because of these lights. They are literally making her sick.

B.2790 April 16, 2023 — gardnerville, NV

They are a nuisance and downright dangerous

B.2791 April 16, 2023 — montgomery, TX

It's ridiculous how bright these lights are and have experienced it myself driving! Very dangerous when you can't see!

B.2792 April 16, 2023 — olympia, WA

Bright white lights blind drivers who must pass by them and that's too dangerous and must be outlawed. Call or email your legislators and congresspeople!

B.2793 April 16, 2023 — ruskin, FL

Dog thief's are disgusting creatures who do not understand that the animal they steal greaves for their home and family! They are cold hearted non humans!

B.2794 April 17, 2023 — Atlanta, GA

I choose to no longer be the driver at night time because of blinding lights. Now that Rivian has made their home in my community, this issue is much worse. The factory is very near my home and many people are driving these vehicles and hopefully it can be understood why I make a choice to not put myself in danger. I've already had my life significantly altered due to a car accident and the driving of another. How would I ever be able to explain that a vehicle's headlights is the liable party in an accident? The blame would be placed on me alone and this is WRONG. I know this because I worked in claims for a large insurer. Something everyone should think about when deciding if this petition is worth their signature. I also hope someone who has decision making capabilities on this issue sees my comment and looks into fair claim-handling practices and notices that consumers may very well be footing the bill for recovery for reasons they are not liable for.

B.2795 April 17, 2023 — Bridgeton, NJ

These lights are blinding. I hope this changed for the safety of all.

B.2796 April 17, 2023 — Chicago, IL

Trying to see at night with rude ass drivers and their bright lights is a really hard thing to do

B.2797 April 17, 2023 — Fort St. John, BC, Canada, Canada

From my experience those headlights prevented me from seeing & she possible, I slowed down & pulled offer to side of road

B.2798 April 17, 2023 — Huntsville, AL

I am signing because it is dangerous and very disrespectful to oncoming traffic.

B.2799 April 17, 2023 — Huntsville, AL

These excessively bright headlights are unnecessary; even at legal highway speeds you don't need to see 18 miles up the road. In urban environments where the streets are well-lit and traffic moves relatively slowly, headlights are mainly useful for making vehicles more visible, not for seeing what's inside the trunk of the car in front. Bottom line is that excessively bright headlights are a danger to everyone on the road and should be banned outright.

B.2800 April 17, 2023 — Jackson, TN

The lights are blinding. And for someone who has issues with her eyes it can be dangerous to drive at night with headlights like LED's.

B.2801 April 17, 2023 — La Jolla, CA

Take out the emissions regulations loophole for light trucks too so that car companies lose the financial incentive to push SUVs and pickups down our throats. It would reduce variation in vehicle height and thus make the road safer for people driving normal cars or riding bikes.

B.2802 April 17, 2023 — Leander, TX

blinding lights are dangerous!

B.2803 April 17, 2023 — Meridian, ID

On top of having eye stigma, I also have a scarred retina that, among other things, gets "burn-in" really easily from intense light, and the effect from those headlights can sometimes linger for 5 minutes at a time--not ideal as a delivery driver.

B.2804 April 17, 2023 — Newfoundland, PA

These headlights are dangerous to oncoming traffic. They blind us all.

B.2805 April 17, 2023 — Oakland, CA

They're too bright!

B.2806 April 17, 2023 — Olathe, KS

I too have problems with the bright lights on headlights. It is very disorienting.

B.2807 April 17, 2023 — Pinnacle, NC

Only ignorant people choose to blind other people at night driving with bright lights.

B.2808 April 17, 2023 — Ponca City, OK

Blinding headlights suck

B.2809 April 17, 2023 — Portland, ME

It used to be that eeeevery so often, I'd end up in front of somebody with improperly aligned headlights, but the easy solution was to let them pass when I was able. Now this problem is no longer a once-in-a-while thing, it's EVERY DAY. Every morning I drive to work, and every day I am forced to shield my eyes from the countless ultra-bright LED headlights on vehicles of all shapes and sizes. This is far beyond annoying or uncomfortable-- it's made driving at night nearly impossible, and driving during the day painful and dangerous. We need regulation yesterday.

B.2810 April 17, 2023 — Rockville, MD

My eyes are green, which means that they have less melanin to protect them with. Since I can't afford a car, I must take public transportation a lot. This means having to sit at bus stops enduring an endless stream of vehicles blazing their headlights into my eyes from the streets and parking lots. This can get physically painful after awhile. However, I have no choice, because I need to keep a steady watch for my bus, or I'll miss it. I sometimes can't even escape from these torturously bright headlights when I'm walking out of a door, or even looking out a window. As such, I even got an eye full of them while eating at a restaurant. Words can't even begin to describe how much I hate those overly bright headlights!

B.2811 April 17, 2023 — Rockville, MD

Those lights are incredibly hard on pedestrians, too.

B.2812 April 17, 2023 — Rockville, MD

Are those the yellow glasses?

B.2813 April 17, 2023 — Rockville, MD

Where I live, the government forces drivers to have their high beams on both day and night...!!!

B.2814 April 17, 2023 — San Diego, CA

I am frequently blinded by headlights

B.2815 April 17, 2023 — Santa Maria, CA

I frequently have to drive along a pass to get to work at night. Hill on one side, cliff on the other. These new car lights are just atrocious, not to mention the brights on some of these cars and work trucks. It's to the point that I have to go from 50 mph to about 25 in order to feel like I'm not going to run off the edge from blindness. Sometimes I can't even see 10 feet ahead of myself cause of this.

B.2816 April 17, 2023 — Toronto, Canada

F150s

B.2817 April 17, 2023 — Tyrone, PA

These lights blind you they are so bright.

B.2818 April 17, 2023 — United States

I have recently build up cataract and flash spot in my eyes and I am only 46 years old. White led headlight is always my problem. Sometimes I need to wear sun glasses driving regardless day or night.

B.2819 April 17, 2023 — Vineland, NJ

These headlights cause such a glare that they are blinding. I find them unsafe to drivers. I cannot see safely when driving.

B.2820 April 17, 2023 — West milford, NJ

Dangerously bright

B.2821 April 17, 2023 — bloomsburg, PA

These lights can only be used in placed where you may tint your window other wise they blind opposing drivers and its not appropriate

B.2822 April 17, 2023 — shelby township, MI

Debra Basilico

B.2823 April 18, 2023 — Cuyahoga Falls, OH

Holly Dobies

B.2824 April 18, 2023 — Indian Trail, NC

I deal with astigmatisms and these headlights make it nearly impossible for me to safely drive after dark. On a busy road with a dozen or so oncoming cars, most having these headlights now, my vision

is just bright starbursts everywhere, nearly whiting out my field of view to the point I almost can't see the lines on the road even. Eventually someone is going to wreck because of this and go after either the vehicle manufacturer or or the aftermarket headlight manufacturer and very rightfully so.

B.2825 April 18, 2023 — Mantua, OH

LED headlights are not necessary.

B.2826 April 18, 2023 — Salt Lake City, UT

Driving is dangerous enough without be blinded by careless drivers and poor automobile design!

B.2827 April 18, 2023 — Sutton, United Kingdom

Blinding headlights are potentially fatal

B.2828 April 18, 2023 — United States

The lights are too bright

B.2829 April 18, 2023 — missoula, MT

The lights we had in the 90's were perfect. They were bright enough to see everything at night but soft enough to not blind anyone. These lights are trashy and impracticaly bright. How many people are killed by being blinded by these impractical light.

B.2830 April 19, 2023 — Bismarck, ND

All aftermarket LED bulb replacement's are illegal for use on the US road ways. This is an issue of not enforcing FMVSS No. 108 by officers and also a total lack of prosecuting those who sell these lights under the guise of them being legal. Reputable aftermarket LED light producers make it very clear that the lights are designed for off road use.

B.2831 April 19, 2023 — Fayetteville, AR

Some headlights are blinding even on dim.

B.2832 April 19, 2023 — Riverside, CA

This sh*t is ridiculous! I get newer lights but these are above & beyond blinding! I can't even imagine what their high beams look like. Initially I didn't know these were the new norm in cars, so I did what anyone else would do to let a fellow driver know(in case they didn't) they had their high beams on.....many a driver either turned on & off their reg headlights to let me know that's all the got, some flashed their high beams (WOW!) to let me know they weren't using high beams. This is gonna kill a lot of ppl!!!

B.2833 April 19, 2023 — Tampa, FL

Because they cause temporary blindness in drivers whether in back of you or oncoming! Dangerous!!

B.2834 April 19, 2023 — United States

I almost ran into the car in front of me one night. The on coming cars were so close together and the 2 lanes are separated by only a stripe on the ground. What if we had a wall separating the 2 lanes?? Both sides face each other, so we are always blairing bright, bright lights at each other. Does anyone care?

B.2835 April 20, 2023 — Dumont, NJ

Mary Turner

B.2836 April 20, 2023 — Philadelphia, PA

It's beyond absurd that this has not been addressed already. There really isn't much else to say. This should be self explanatory. It's similar to driving into the sun in the morning and unable to see the road, but yet we have rules for how far your tires can be outside of the wheel wells

B.2837 April 21, 2023 — woodbridge, ENG, United Kingdom

Simply because LED lights are dangerous. Numerous times, I have been dazzled by lighrs that were no better tgan on full beam.

B.2838 April 22, 2023 — Hamilton, Canada

LED headlights continue to blind myself and other drivers even in the brightness of daylight. It is extremely dangerous to blind other drivers and against the highway traffic act. LEDs are dangerous and unnecessary.

B.2839 April 24, 2023 — Spotsylvania, VA

I'm blinded by the light.

B.2840 April 25, 2023 — San Jacinto, CA

Raised trucks that don't adjust their lights down to regulated distance and when you flash them, their lights point 45 degrees up. And tow trucks with all six headlights on high beam when regular driving, not on service call. They blind you enough that you cannot see stationary big rigs waiting to make a left turn on a one lane road. Lastly those cars and trucks that have LED light bars between their headlights always on bright and light up the inside of your car like it was an ET. So, need enforceable regulation on brightness, intensity & distance on raised vehicles. Set at the factory and/or dealers for their areas and notices to buyers from auto and tire dealers and custom shops. Lastly more roaming police light check stations. Usually, no trouble with big rig lights so why can't P/U trucks keep it down?

B.2841 April 26, 2023 — Dallas, TX

The LED headlights are dangerous to other drivers.

B.2842 April 28, 2023 — Deatsville, AL

Sometimes I'm being blinded from both ahead and behind. It's actually really scary, because I can't just slow down. People get aggressive. So I literally can't tell if I'm about to hit something. I don't even have an astigmatism.

B.2843 April 29, 2023 — Ludlow, MA

Headlights are outta control and unsafe.

B.2844 April 30, 2023 — Camarines Sur, CT, Philippines

Bright white led lights blind oncoming traffic thus posing a danger to motorists and pedestrians.

May 2023

B.2845 May 3, 2023 — Provo, UT

I care about human life

B.2846 May 3, 2023 — United States

I want to drive safe at night

B.2847 May 3, 2023 — Westwood, NJ

I like being able to see

B.2848 May 4, 2023 — Petaluma, CA

These headlight can be blinding to oncoming drivers and thus very dangerous

B.2849 May 4, 2023 — Riverhead, NY

These lights are blinding, which makes it LESS safe for oncoming drivers. There needs to be some standard for safety for both the driver and oncoming traffic.

B.2850 May 4, 2023 — Spring, TX

I can't see when these lights hit my eyes. Too dangerous!

B.2851 May 5, 2023 — Burt, MI

I remember reading years ago, when I first noticed how these very bright lights affected my ability to see well when driving at night, that part of the reason it is a problem here in the US is because our headlights are directed upward to illuminate road signs. In other countries, where signs are illuminated through other means, the headlights are directed downward so they are not shining

directly into the eyes of drivers in oncoming traffic. Barring a complete change in how our road signs are illuminated, I would like to see more regulation on the use of very bright LED lights.

B.2852 May 5, 2023 — Simpsonville, SC

This has to be changed. There is no excuse for using lights that cause injury and death.

B.2853 May 5, 2023 — Woodinville, WA

I cant see when im driving at night

B.2854 May 10, 2023 — Salisbury, MD

There have been numerous times at LED headlights have almost caused me to have an accident. HIDs we're banned for this very reason back in the early 2000s.

B.2855 May 12, 2023 — Capistrano Beach, CA

I can't see on the road or use my mirrors at times due to these headlights, which is very unsafe. They also trigger migraines for me.

B.2856 May 12, 2023 — Huntington Beach, CA

I FUCKING HATE HOW BRIGHT HEADLIGHTS ARE!!!! LIKE JUST LEAVE EM ON AS BRIGHTS WBHEN YOU TURN ON BRIGHTS, NOT NORMAL HEADLIGHTS

B.2857 May 13, 2023 — Chicago, IL

They are blinding

B.2858 May 13, 2023 — Irvington, NJ

I want to save lives

B.2859 May 14, 2023 — Grass Valley, CA

I have astigmatisms and driving at night is already very difficult.

B.2860 May 15, 2023 — Kettering, ENG, United Kingdom

The bright headlights at night have nearly caused me to have an accident. I find them to bright and a hazard

B.2861 May 16, 2023 — Victoria, Canada

I dont want to die after being blinded by someone's headlights.

B.2862 May 17, 2023 — Bloomfield, NJ

I have become uneasy driving at night due to these insanely bright headlights on newer vehicles. They cause instant night blindness preventing you from seeing who or what might be in the road in front of you. I have also suffered actual pain from encountering these lights head on. Other than aesthetics they serve no useful purpose and are making our roads, especially our local one's extremely dangerous.

B.2863 May 17, 2023 — Bromley, United Kingdom

I am fed up with being 'blinded' by these headlights - it so SO dangerous.

B.2864 May 17, 2023 — London, ENG, United Kingdom

Because they are dangerous

B.2865 May 18, 2023 — Centereach, NY

yeahhhh fuck led headlights

B.2866 May 19, 2023 — West Springfield, MA

I have these lights on my car, and I understand that they are extremely blinding, dangerous, causing accidents and injuries. They should be banned everywhere, and any car that has them should be able to have incandescent lights installed immediately for free. We do not need to make another contraption to deal with the effects of these lights. Stop making them, stop installing them, and

reinstall normal incandescent bulbs on all cars that currently have them. Common sense says this is the only way.

B.2867 May 20, 2023 — Glendale, AZ

I pulled out in front of oncoming traffic because a truck was blinding me at night. We were both making a left turn in the middle of the intersection. I just missed being hit head on. I was completely blinded. I had to get away from it so I turned in front of oncoming traffic.

B.2868 May 23, 2023 — Sydney, Australia

because i have had near misses with bright LED headlights which are temporarily blinding

B.2869 May 26, 2023 — Ashland, MA

We need to find the balance between energy efficiency and health. Corporate influences must not overrule science and common sense. Please bring back incandescents until a new safe solution is developed.

B.2870 May 27, 2023 — Port Saint Lucie, FL

why not

B.2871 May 29, 2023 — Mooresville, NC

I wish I could take back my signature. This is a petition requesting the ban of a particular technology, not the regulation of headlights.

B.2872 May 31, 2023 — Madison, WI

Not true

B.2873 May 31, 2023 — New Iberia, LA

Some of these headlights and taillights can trigger seizures and severe migraines in people with certain neurological diseases. I shouldn't have to give up driving at 38 y/o due to the risk of seizure or debilitating migraines, but I've had to do just that.

June 2023

B.2874 June 1, 2023 — Prospect, KY

Even after cataract surgery removed the halos and stars from lights at night, I am frequently blinded by oncoming headlights worse than any previous high-beams. It prevents me from seeing oncoming traffic, or blinds me from behind and prevents me from seeing anything else around me, like road hazards and other vehicles. People are supposed to dim their lights for oncoming traffic; the new LED headlights are brighter than old high-beams! So. Dangerous!

B.2875 June 5, 2023 — South Orange, NJ

The use of these ultra bright headlights is extremely blinding and distracting not only are drivers blinded from on coming traffic, they are also blinded by reflective light from all rear and side mirrors. These effects ts are worsened on anyone older or dealing with simple eye conditions like astigmatism. This a large percent of the population that drives. Bright lights from oncoming traffic also blind drivers to pedestrians and bikers on town and city roads.

B.2876 June 10, 2023 — Grand Falls-Windsor, Canada

sick of these dumb pricks with bright ass headlights on well lit roads

B.2877 June 27, 2023 — Bronson, FL

LED Headlights are dangerous to oncoming traffic, even in the daytime. Stop the assault on other drivers.

B.2878 June 27, 2023 — Peoria, AZ

I'm tired of being blinded by these dangerous lights while driving at night. They are not safe.

July 2023

B.2879 July 10, 2023 — Nalgonda, India

Definitely, there has to be regulations about what kinds of lights are good for oncoming traffic and not just for looks or something. Lights should serve the purpose and not otherwise. I wonder if there had been any discussions about bringing LED lights into usage as headlights and drls etc. This regulation should be made international for the good of mankind.

B.2880 July 22, 2023 — Dayton, OH

Because tired of being blinded at night!

B.2881 July 24, 2023 — Valley Stream, NY

I'm signing because bright headlights and tail lights have made driving at night so incredibly unpleasant that I rather not drive at night at all. I'm a 33 year old person, not in my 60s or above. The fact that people of all ages are affected should be evidence that the lights being made today fail to meet certain standards and it's causing distraction, disorientation and danger on the road for ALL.

B.2882 July 26, 2023 — Calgary, Canada

Who is responsible if accident happens when I was blinded by this head lights.

August 2023

B.2883 August 1, 2023 — Murrieta, CA

Led headlights are blinding and unnecessary and dangerous.

B.2884 August 2, 2023 — Greensboro, NC

I don't understand, do some people just not have any night vision or are they too mentally retarded to realize they're being blinded? Why are all of these new lights so f@cking bright?!

B.2885 August 3, 2023 — Ottawa, Canada

The car lights are so blindin when I drive even if I looks away from the car. I have to adjust my mirrors because the glare is so bright it's like if you're looking at the sun. Leaves a spot on my eyes when looking forward or back mirror. They are too intense.

B.2886 August 3, 2023 — Scottsdale, AZ

https://www.activistpost.com/2023/07/behind-your-back-yet-in-front-of-your-eyes-blinding-technologies-for-vision-burnout.html

B.2887 August 5, 2023 — Hammond, IN

Why? I'd like to be see why i'm flying down a highway at 75. They are literally painful and cause discomfort. EMS/Police lights too. I'm not being hyperbolic or dramatic. These need to go.

B.2888 August 8, 2023 — Pleasant Hill, CA

I'm tired of being blinded by these types of headlights. They're not safe

B.2889 August 10, 2023 — Levittown, PA

We don't have reliable or effective public transit across America and it's designed for people to rely of automobiles and I basically had to stop driving because when the sun goes down I literally can't see the street lines the second another car is driving in my direction. I imagine this is a huge problem for a lot of people and there aren't really any good alternatives other than just risking your life

B.2890 August 11, 2023 — Township of Taylorsville, NC

I do a lot of night driving and I can't count how many times that I've been blinded by these outrageous lights. There's no sense in them being that bright. It has almost caused a few accidents for me on long trips.

B.2891 August 13, 2023 — Lexington, NC

I literally cannot see at all when driving past an LED headlight car (or when in front of one). It is INSANE that they're allowed to be on the road. It's dangerous and irresponsible and has caused and will continue to cause vehicular accidents. Please fix this!

B.2892 August 17, 2023 — Winsted, CT

Which were just banned earlier this month!!!!

B.2893 August 17, 2023 — Winsted, CT

I'm going crazy every night almost getting blinded off the roads. It's so dangerous and horrible for everyone and everything.

B.2894 August 20, 2023 — Charlevoix, MI

Headlight output laws were put in place for a reason. Modern cars are built oblivious to this and the headlights are blinding and unsafe. Our eyes are still human just like before. The worst offenders for blinding lights are the modern police cars. When they're sitting there with flashing lights, there is 100% some situation going on. Your entire vision is washed out, even proceeding at a crawl. There's no reason the lights can't be auto dimming based on the amount of ambient daylight or lack of.

B.2895 August 21, 2023 — Cleveland, OH

I'd like to add this. How much WORSE is it when a psycho who happens to be a cop seems to get a perverse pleasure out of stalking and threatening innocent drivers - using her insanely bright lights as a weapon? A woman alone at night - not another car seen for almost 5 miles - when a woman cop keeps running up on the woman's car/tail/bumper, moving back and then speeding up - for over 4. 5 miles - IN HEAVY HEAVY FOG, up and down hills!!! When the innocent driver tries to move to see who is behind her and free her eyes from the blazing lights of 6 suns - the cop pulls her over for "weaving". The cop even acknowledged that the woman driver has complained before that "YOU ARE BLINDING ME" and I cannot see with your lights (later on video - TEN BLAZING, GLARING LIGHTS not counting the flashing bar turned on after stopping the woman). and the same cop has done this twice in 6 months (the driver is only in that town once a month!) So this is a HUGE issue - as is the willful life threatening behavior of that psycho cop (who had been fired from her only other job).

B.2896 August 21, 2023 — Murfreesboro, TN

These lights are extremely dangerous to motor vehicles and more. They cause a type of blindess and disorientation. These bright lights are the reason I don't drive at night. They shouldn't be used on motor vehicles of any type, including emergency vehicles and construction lighting.

B.2897 August 22, 2023 — Australia

i drive a lot at night and its becoming increasingly hard to not be blinded by these lights, especially because they are so high on the vehicle

B.2898 August 22, 2023 — Beaver Island, MI

I'm fighting light pollution!

B.2899 August 22, 2023 — United States

We should ban LED lights in general. Terrible idea with no proper testing done. They are literally everywhere now and I have to wear sunglasses during the day and night because of how strong these lights are. Even with my sunglasses, my eyes end up getting irritated with these new lights. I hate driving back home during the night because of how bright these lights are when they come by from the opposite lane. I've seen some street lights with LED bulbs and it's so distracting. I used to like driving at night but now I just have to deal with constant surprise flash bangs on the road. I want to go back to florescent and Halogen again. I miss not worrying if I'll get flashed in the face and not having to wait until the traffic is gone just to drive back home safely at night.

B.2900 August 23, 2023 — Roanoke, VA

I have given up driving at night after running off the road due to the blinding glare of LEDs and HIDs. These lights are dangerous!

B.2901 August 23, 2023 — Rome, GA

Projector lights in Forrester allow me to only visualize the bottom 25% of my windshield, much worse going over a hill. How the heck is this safe?? Cannot see street lights or anything on sides of road as well as 3/4 of regular viewing area. If using adaptive dim setting, oncoming traffic is constantly flashing brights at me as if I'm using high beams.

B.2902 August 24, 2023 — Atlanta, GA

Just had to follow an older handicapped person on the road for miles because a truck with blinding led lights was tailing them and blinding them. They drove significantly better once I blocked the light from their view. BAN LED HEADLIGHTS ESPECIALLY ON RAISED VEHICLES

B.2903 August 24, 2023 — China Grove, NC

I have sensitive eyes and LEDs blind me and make my eyes genuinely hurt!

B.2904 August 24, 2023 — Lincoln, United Kingdom

I wear glasses and sometimes at night I cannot see where I am going at all because of the glare from LED headlights coming the other way.

B.2905 August 24, 2023 — Seattle, WA

Driving at night is already difficult for many people. Older folks, and people with visual impairments alike. Bright lights make it difficult for people with light sensitivity to drive too. There is no need for cars to be so bright

B.2906 August 25, 2023 — Ocoee, TN

I'm gonna start busting headlights

B.2907 August 27, 2023 — Cedar Park, TX

Agreed

B.2908 August 29, 2023 — Orlando, FL

We have street lights in most areas. There is no need for those headlights. They are literally blinding driving toward or behind you in the dark. If behind me and cannot navigate out of their range, I'm forced to flip the rearview mirror up to help with the glare. My eyes begin to hurt. Highway driving at night is the worst.

B.2909 August 29, 2023 — West Chester, PA

The technology is there and used in high end manufacturing, it should be a minimum standard for all makes and models. At least have the option initially.

September 2023

B.2910 September 1, 2023 — Hopkins, MN

I am tired of tailgaters irritating my eyes. Even in the daytime, some headlights are absurd, as if they're competing with the sun.

B.2911 September 1, 2023 — Savannah, GA

I'm 68 years old and refuse to drive at night anymore. I am totally blinded by oncoming traffic's headlights.

B.2912 September 4, 2023 — West Chester, PA

I like to be able to see when I'm driving at night, which I can't when half the other cars on the road have two fucking searchlights for low beams

B.2913 September 7, 2023 — Amlwch, WLS, United Kingdom

LED's are starving us from a natural source called NIGHT TIME a time to rest

B.2914 September 7, 2023 — Knoxville, TN

These INSANE, BLINDING lights are a PAIN IN THE EYES!!! Especially if one drives a low-profile vehicle! Here you have these GIANT pickup trucks blinding you from behind & coming toward you! I

put my standard lights on BRIGHT EVERY time one of these INSANE lights come towards me if I'm not going to bother a vehicle in front of me! It's literally HELL to drive at night anymore & further it seems NO-ONE in the US Government cares to do ANYTHING about it no matter who gets petitioned. I think this will NEVER change!

B.2915 September 10, 2023 — Ottawa, Canada

Driving, walking, or cycling LED headlights are blinding no matter what age.

B.2916 September 12, 2023 — Brooklyn, NY

I am a driver of a sedan, and I am having a difficult time dealing with these bright car headlight beams all around me at night. My vision is suffering as a result and I fear that being blinded by these unnecessary lights will inevitably cause me to crash my car. These lights must be modified or banned for the safety of all people.

B.2917 September 13, 2023 — Stephentown, NY

I can not see when these blinding headlights are coming towards me...I no longer drive at night because of it.. Sure would be nice to go to dinner or a movie at night...

B.2918 September 16, 2023 — Lusby, MD

When I drive at night all I can see sometimes is bright blue dots. If people think these overly bright headlights make them safer they should ask themselves if making everyone else on the road bike is safer.

B.2919 September 17, 2023 — Woodstock, United States

Jill Nelson

B.2920 September 19, 2023 — Houston, TX

I can not believe these LED lights where even given the green light to begin with. They are extremely dangerous and painful. They give me headaches, make me want to throw up and give me anxiety. Throw the entire crew of idiots away that thought this was a good idea. No telling how many people have not lived to speak on how they lost they're life in an accident due to blinding lights. They probably just think they drove into on coming traffic for no reason. Get rid of the ridiculous LED headlight right now.

B.2921 September 20, 2023 — Stuart, FL

Absolutely getting out of control and readily available at online everywhere (Amazon), and stores like Napa, Walmart, etc. Some kid does an "upgrade" to their first vehicle by installing these ultra bright headlights (of course they buy the very brightest (for safety) and they are so excited about how much better they can see that they do the same for their mom, their dad, their girlfriend and the girl friends neighbor... It is at the point that I MUST SHIELD MY EYES with my hand and that becomes a distraction. I am certainly not alone.

B.2922 September 20, 2023 — Stuart, FL

I can't enjoy a walk at night in my neighborhood.

B.2923 September 20, 2023 — Stuart, FL

LED pollution. Yes, it doesn't get dark in suburbs anymore... almost dusky is the darkest it can get. I can't teach my kids about the starts and constellations unless I take them to a planetarium (and the gizmo uses LED lights)

B.2924 September 20, 2023 — Stuart, FL

Use dark green welding goggles to drive BUT you won't be able to see red traffic lights or brake lights

B.2925 September 20, 2023 — Stuart, FL

on road trip travels, I used to prefer to drive at night because it is cooler and easier on the eyes... NOW< forget about it....

B.2926 September 21, 2023 — Norfolk, VA

Can no longer drive at night, & even walking is difficult, due to these lights on cars and elsewhere.

B.2927 September 21, 2023 — Topeka, KS

LED lights are great for offroad use, but there is no reason to use them on the road.

B.2928 September 24, 2023 — Coatesville, PA

I cannot see at night

B.2929 September 24, 2023 — Daytona Beach, FL

Signed. Now, let's work on getting LED LIGHT BARS banned. Every single pick up and jeep in my town has them on full blast, and it doesn't even matter if you look away, you're still getting blinded. Ugh.

B.2930 September 24, 2023 — PA, United States

I suffer from photophobia due to a concussion it's struggling to drive on a normal basis but the car industry is interfering with the priceless to drive LEDs are seen by people with concussion and head injury as a strobe light and sometimes can set off a migraine in addition the car industry continues to fancy up the tail lights making them blink more or steam from center to left on turn signals . They need to go back to basics

B.2931 September 24, 2023 — Stuart, FL

Put on your flashing hazard lights momentarily and stop in the middle of the road until the dangerous situation ends. Block your eyes with your hand until the visual impairment hazard ends, too...

B.2932 September 26, 2023 — Beverly Hills, CA

The bright LED lights are horribly blinding and give me a headache. They are a hazard and should not be allowed on the road.

B.2933 September 26, 2023 — IN, United States

I am unable to drive at night because of these glaring, blinding lights. This much light is not necessary for any driver!

B.2934 September 26, 2023 — London, Canada

Was just driving home on the 401 and a rainstorm hit halfway. I could barely see a few meters with all the lights reflected from the oncoming lanes super bright LED's. If someone was behind me I was blinded in my mirrors. These lights are way too much, people are going to get hurt if something doesn't change.

B.2935 September 26, 2023 — Mahomet, IL

I'm a concerned American citizen who is often on the receiving end of these extremely dangerous unnecessarily bright blinding headlights from city police cruisers, ambulances, sheriff's vehicles, state troopers and any other and all first responders to semi trailers and all ordinary every day vehicles. I hit a deer and totaled my vehicle when I topped a hill and was severely, I mean severely blinded by a city police cruiser's 100% blinding headlights. The police cruiser was sitting on the side of the road facing the opposite direction. This accident could have been avoided.

B.2936 September 26, 2023 — Odessa, TX

These lights are dangerous!

B.2937 September 27, 2023 — Yes, FL

I swear people don't care if they could end up killing someone with those lights....

B.2938 September 29, 2023 — Bergenfield, NJ

I am 75 years young and have no problems driving at night until some inconsiderate person behind me insists on driving with their halogen high beams on or some oncoming traffic has their halogen high beams on blinding me! Those halogen headlamps should be illegal since they blind you and cause deadly accidents! They do more harm than good!

B.2939 September 29, 2023 — Demarest, NJ

It would s horrible.

B.2940 September 29, 2023 — Old Tappan, NJ

This is a problem that I've been experiencing also. Thought it was my age also. So glad to hear it is not just me! These bright headlights are dangerous & need to be addressed.

B.2941 September 29, 2023 — Oradell, NJ

These headlights have limited my ability to drive after dusk. They are dangerous and should be changed.

B.2942 September 29, 2023 — Piermont, NY

This is a real problem because the one with the bright headlights can't tell that the other person is blinded. The daytime running lights are horrible too, people think their lights are on at night but they are completely dark in the back waiting to get rear-ended. Police do not understand this either. The flashing lights and headlights are super bright so you can't see them waving you by or telling you to back up etc and you can't judge the distance because you can't see.

B.2943 September 30, 2023 — Old Tappan, NJ

They are blinding

B.2944 September 30, 2023 — Shoreline, WA

I hate being blinded while driving it makes me want to drive into a tree

October 2023

B.2945 October 1, 2023 — Brunswick, GA

These bright headlights are dangerous and I've almost been in car accidents from being blinded.

B.2946 October 1, 2023 — Hubert, NC

Astigmatisms only make it worse

B.2947 October 1, 2023 — Nyack, NY

Marie Venusti Dilluvio

B.2948 October 1, 2023 — Sammamish, WA

Those lights are menace to every single pedestrian, cyclist, and driver! I have Asperger's syndrome and I can't imagine how terrible it would be for those who are more susceptible to sensory overload or who have epilepsy or light sensitivity. I even got extreme sidewalk rage from inconsiderate drivers who don't dip their brights and now I can't do even night walks without worrying about being blinded by them. These things should be ILLEGAL!

B.2949 October 2, 2023 — Australia

The modern lights on cars are dangerous and will amount to more accidents

B.2950 October 2, 2023 — Gateshead, United Kingdom

Bright headlights are dangerous.

B.2951 October 2, 2023 — Philadelphia, PA

Led lights are just too intense. They need to be measured in lux and not lumens. Even during the day they are blinding

B.2952 October 2, 2023 — Private, TX

I am light sensitive. They make me sick, give me migraines and vertigo. Also, LED headlights are dangerously bright, blinding people in oncoming traffic.

B.2953 October 5, 2023 — Kailua-Kona, HI

It is very difficult driving at night with the blinding brightness of oncoming cars. It is very dangerous.

B.2954 October 5, 2023 — Livermore, CA

LEDs are blinding and dangerous. In the city and suburbs, you can literally drive at night with no lights on, much less blinding LED. Lumen should be limited to 1100.

B.2955 October 5, 2023 — Portland, OR

modern headlights have almost caused me to swerve into ditches or other people because i cannot see the road at all even after they pass me. I also cannot see road signs due to this and I have almost gone straight on curvy roads. It is extremely unsafe for everyone and it has almost been the cause of my death numerous times.

B.2956 October 6, 2023 — Ottawa, Canada

The blinding headlights of so many cars now make it very difficult for me to drive at night. And in the rain, the lights are even more blinding!

B.2957 October 7, 2023 — Brooklyn, NY

I can't tell the difference between people's brights and regular headlights. I am constantly blinded by 75% of cars coming in the opposite direction in good weather and when it's raining it's even worse. People seeing more in front of them should not come at the expense of blinding others.

B.2958 October 7, 2023 — Cudahy, CA

Because they are dangerous...

B.2959 October 7, 2023 — Detroit, MI

I cannot stand driving at night anymore

B.2960 October 8, 2023 — Rockport, ME

I HATE THEM!!

B.2961 October 9, 2023 — Bloomingburg, NY

Tired of being blinded by oncoming led headlights,also I've seen tail and brake lights that are also. THIS NEEDS TO STOP!!!

B.2962 October 9, 2023 — PA, United States

Yes these led lights are eliminating this group of people from driving due to light sensitivity, concussion, migraines, and seizures. They need to take this population into consideration. The white, strobe led light on top of school buses in Pennsylvania are significant to these symptoms as well.

B.2963 October 10, 2023 — Rio Grande, NJ

led headlights suck

B.2964 October 11, 2023 — Mount Laurel, NJ

Is there a way to automatically send a letter to our representatives in Congress?

B.2965 October 12, 2023 — Australia

Modern LED. HID and other headlights are so bright that I cannot see anything at all when oncoming cars shine them in my eyes. Nothing. I can't see the ground, let alone pedestrians, road dividers, or even other road traffic. I am one of several I have talked to who has had to shut their eyes while driving. What will you say when someone runs over a family member of yours and, thinking they have driven through a big pothole, keeps driving?

B.2966 October 12, 2023 — Canada

I work night shift. For me its real danger every night.

B.2967 October 13, 2023 — Queens, NY

I can barely see where I'm going at night.

B.2968 October 19, 2023 — Beaverton, OR

[name removed], please contact me. I am the admin of this petition: [electronic mail address removed]

B.2969 October 19, 2023 — Beaverton, OR

[name removed], I am the admin of this petition. Please email me: [electronic mail address removed]

B.2970 October 19, 2023 — Ferndale, MI

I was in a car accident because of this

B.2971 October 23, 2023 — Birchgrove, WLS, United Kingdom

Completely agree. Constantly being dazzled by these and the dipping headlights.

B.2972 October 27, 2023 — penfield, NY

These headlights need to be recalled and replaced immediately.

B.2973 October 28, 2023 — Omaha, NE

Blinding headlights are dangerous!!

B.2974 October 31, 2023 — Fort Worth, TX

I can't stand these lights coming at me or when they're behind me, even during the day they're aggravating.

November 2023

B.2975 November 1, 2023 — Bruceton Mills, WV

Because I deserve to be able to see safely too and I can't with these lights.

B.2976 November 1, 2023 — New York, NY

These lights are blinding, migraine inducing, dangerous and uncivilized. The dangers they cause should be enough to have them banned.

B.2977 November 2, 2023 — Kingsville, Canada

I know the negative effects of these headlights.

B.2978 November 2, 2023 — Washington, DC

I can't see!

B.2979 November 2, 2023 — ascutney, VT

These lights are BLINDING!

B.2980 November 3, 2023 — PROVIDENCE, RI

These are profoundly dangerous to all fellow drivers and genuinely leave me, at least, on the verge of an ocular headache each time I encounter a set. I take seriously my responsibility to avoid distracted driving, yet this is one poor choice I have no way to anticipate or escape. It stinks.

B.2981 November 4, 2023 — Birmingham, AL

I have headaches from driving home at night after experience the excessive light from car high beams. It is harder to see my surroundings with how bright they are.

B.2982 November 5, 2023 — San Diego, CA

I have great eyesight, and these lights are absolutely way too bright to handle and not be distracted and able to see the road. My wife has worse vision and literally hasn't driven at night for two years because it's so difficult to see.

B.2983 November 7, 2023 — Toronto, Canada

It's ridiculous how bright these lights are! The blind pedestrians and other drivers and cause accidents!

B.2984 November 9, 2023 — Lake Village, IN

They're illegal, they must be white and no brighter than 3000 candelas. This has been law since 1968. The majority of aftermarket lights DIYs add to their vehicles are illegal when used on public roads.

Lighting Location Color Headlamp: Front White Turn Signal: Front Amber Identification Lamps Front Amber Clearance Lamps Front Amber Hazard Lamps Front Amber License Plate Lamp Rear White Backup Lamps Rear White Hazard Lamps Rear Red or Amber Tail Lamps Rear Red Stop Lamps Rear Red Turn Signal Rear Red Clearance Lamps Rear Red Federal Motor Vehicle Safety Standard 108 (FMVSS 108) regulates all automotive lighting, signalling and reflective devices in the United States.

B.2985 November 10, 2023 — United States

I hate being blinded by blinding headlights and led daytime running lamps, and people driving with off road lights on public roads. #banblindingheadlights #bandeafeningexhaust

B.2986 November 11, 2023 — Hempstead, TX

I have an astigmatism and these lights scare me every day. I hope we can get these regulated and fixed

B.2987 November 11, 2023 — Orange, CA

LED Headlights Especially on trucks that are not originally fitted with them are causing me dangerous night time driving situations. As a combat Army vet I already suffer random migraines headaches. These LED headlights are way way to bright on coming towards drivers. These need to be replaced with lower output brightness.

B.2988 November 11, 2023 — Sydney, Australia

I'm tired of being blinded by cars at night.

B.2989 November 12, 2023 — Kansas City, MO

I'm signing because they're unsafe for the road! They're unsafe for anyone. They cannot possibly add enough additional acuity for the driver on the road to justifying making it exponentially more unsafe for every single driver whom they drive opposite of. They're blinding. I have to put my hands up in front of my eyes when I am driving opposite someone with these headlights, which clearly is NOT good for road safety. They're selfish, they're wrong, we need to outlaw these and make there be a legal limit for how many lumens headlights can be. Simple as that. Very glad to be supporting this petition.

B.2990 November 12, 2023 — Oakland, CA

I like being able to drive (or walk or bicycle) safely without being blinded by others' headlights

B.2991 November 12, 2023 — Smithfield, UT

I know how hard it is to drive with blinding lights.

B.2992 November 13, 2023 — Madison, WI

LED and Xenon headlights are blinding with a brightness that is unnecessary.

B.2993 November 13, 2023 — Vancouver BC, BC, Canada

The LED headlights are so bright that they blind me when I am driving. I have to wear sunglasses at night and they are still too bright. They are going to cause a lot of accidents. Living in the city is stressful enough and we do not need the whole city driving around with their high beams on blinding oncoming traffic. For that matter if a large truck is behind me it blinds me in my rear view mirror as well. This has got to be reversed immediately! So do the LED Street lights!

B.2994 November 14, 2023 — Gilbert, AZ

You guys are not aiming your reform at the true problem... LED headlights are fine, when implemented and used CORRECTLY! The problem we have is all the D-bags in lifted vehicles who have their headlights aimed higher than they should be. And also the guys who simply put LED bulbs into headlights that were designed for halogen beams, which causes glare unlike properly designed LED lights.

B.2995 November 14, 2023 — Swansea, United Kingdom

It's extremely distracting and it is painful f9r the eyes they should be kllegal

B.2996 November 15, 2023 — Baguley, ENG, United Kingdom

Tonight I almost smashed a rear door into a child who was existing on a narrow road, be ause I could not see pass the pissing lights of their car. They are dangerous enough when driving nevermind parked on narrow roads full blazing so you can't see what's going on past the car! They need banning

B.2997 November 15, 2023 — Baguley, ENG, United Kingdom

Tonight I almost smashed a rear door into a child who was existing on a narrow road, because I could not see past the pissing lights of their car. They are dangerous enough when driving nevermind parked on narrow roads full blazing so you can't see what's going on past the car! They want to thank their lucky stars I'm not one to rally around the place...They need banning

B.2998 November 15, 2023 — Columbus, OH

Lights above a certain brightness are a danger to oncoming drivers

B.2999 November 15, 2023 — Los Angeles, CA

I hate those dumb ass bright lights!! Shits dangerous

B.3000 November 15, 2023 — Lynchburg, VA

These lights are so dangerous! They are worse than regular lights on high beams! I don't know who thought these lights are safe! Companies who manufacture them should be sued, for the accidents they cause!

B.3001 November 15, 2023 — Milwaukee, WI

fuck these god damn lights

B.3002 November 15, 2023 — Palatine, IL

LED car headlights are way too bright during nighttime driving. It becomes even worse when people use high beams when they're ABSOLUTLY NOT NECESSARY. Legally, you are only allowed to use high beams when it is difficult to see and there is no approaching traffic (not just cause you feel like it). LEDs create extreme glare, which blinds all incoming traffic and from the back if they are behind you. This makes it way more dangerous to drive at night than it should be.

B.3003 November 15, 2023 — San Antonio, TX

This is dangerous for other drivers.

B.3004 November 15, 2023 — Seattle, WA

I care about people not crashing

B.3005 November 15, 2023 — United States

Brian Miller stated a few comments ago: "You guys are not aiming your reform at the true problem. LED headlights are fine, when implemented and used CORRECTLY! And also the guys who simply put LED bulbs into headlights that were designed for halogen beams, which causes glare unlike properly designed LED lights". So Brian, all of the hundreds of thousands of people on here, Facebook, Twitter, Tik Tok and other social media complaining about these headlights are wrong, and you are right? And all of the medical studies and government agencies condemning LED headlights as poisonous, photo-toxic and dangerous are also wrong, but you are right? How absolutely laughable. I drive for a living and I see headlights all day long, every day. I see them on in the daytime as well as on overcast and raining days, when it is light out. So I can clearly see that the majority of these problematic headlights ARE factory installed LED headlights on newer vehicles. Only about 20 percent of them are LED bulbs in halogen housings or aftermarket LED retrofit kits (easily identifiable). EXCEPT for semi-trucks. For them the rate of illegality is near 95 percent. As for the naysayers who continue to claim that the problem with LED headlights is merely that they are all misaligned, and that all of these vehicles with LED headlights are leaving the factory that way: that as well is absolutely laughable. And even IF that was true, that only PROVES that LED headlights are dangerous. Because any PROPER headlight would NOT be blinding or dangerous even if they WERE misaligned. In my 35 years of driving I have met many vehicles with one or two halogen headlights obviously misaligned, either pointing too high or too far into my lane. Even misaligned, no halogen headlight has EVER forced me to close my eyes, or almost made me have an accident because I could

not see anything, caused me eye pain, or given me a pounding headache. But that's a regular occurrence for me (and many others) with these so-called "correctly implemented and used" factory LED headlights. This is simple logic, Brian. Try using it sometime. The only properly designed LED headlight is one that has been smashed to shards with a baseball bat. PS: I have been typing this with a belly full of pain killers which I took to try and cope with ANOTHER ocular headache brought on by exposure to FACTORY LED headlights on my drive home from work in the dark.

B.3006 November 16, 2023 — Houston, TX

I have astigmatism and the headlights are way too bright at night which causes difficulty to see ironically.

B.3007 November 16, 2023 — Silver Spring, MD

Headlights are too damn bright nowadays, and something needs to be done about it!

B.3008 November 16, 2023 — Tampa, FL

My eyes are light sensitive, and these headlights appear to me as if they are on the 'bright' setting. They are essentially blinding for someone like me....I've had many terrible experiences trying to navigate, particularly with narrow and/winding roads, with drivers of vehicles with LED headlights. The jacked up trucks are the worst, due to where their headlights hit the side & rear view mirrors of smaller vehicles.

B.3009 November 17, 2023 — Portage, PA

Boy,the mentality

B.3010 November 18, 2023 — Ashburn, VA

I'm tired of being blinded every night

B.3011 November 18, 2023 — Bicester, ENG, United Kingdom

Just because EV cars have longer range with LEDs it should of never been passed to be allowed into production, I remember 10+ years ago when people were modifying there cars with HID and getting pulled for it, now its the norm! Is this another reason they are having to reduce speed limits because everyone is dazzled by the lights?! It needs to change.

B.3012 November 19, 2023 — Fort Worth, TX

I almost ran off into the ditch because of these light - twice (from a big truck). Was coming home from class - roads are marked but blinded me big time. Scared me.

B.3013 November 20, 2023 — Plant City, FL

It is time to make driving safe for everyone again.

B.3014 November 20, 2023 — Vancouver, Canada

They are indeed blinding for other drivers, pedestrians & animals, both pets & urban wildlife.

B.3015 November 21, 2023 — Dallas, GA

As somone eith astigmatism driving home at night has become something I dread.

B.3016 November 23, 2023 — Calhoun, GA

I believe in saving lives and agree with what this petition is saying. Plain and simple all these bright lights do indeed cuase a bright blinding to the other drivers on the road.

B.3017 November 24, 2023 — Columbus, GA

I have an astigmatism in both eyes, and am very prone to migraines and driving at night is so stressful. I wish I could just not drive at night, but it's simply not feasible. Please limit the lumens on headlights so we feel safer driving at night

B.3018 November 24, 2023 — Fort Lauderdale, FL

Safe driving

B.3019 November 28, 2023 — Martinez, CA

Not only are these lights blinding and dangerous but it is triggers migraines to people, such as myself. I was so blinded driving last night that I woke up with an excruciating migraine! These lights need to be band!!

B.3020 November 28, 2023 — Tacoma, WA

I almost hit a guy because someone else's headlights made it impossible to see the road

B.3021 November 29, 2023 — New Albany, OH

LED headlights feel like someone shining a spotlight directly in your eyes. Painful, distracting, and dangerous. Please ban these awful lights from the market!

B.3022 November 29, 2023 — Port Chester, NY

Suzanne Dolgetta

December 2023

B.3023 December 1, 2023 — Eugene, OR

I'm a senior, nearly 70, and have had cataract and DESEK surgery. So, the latest super-bright headlights really glare and bother my night vision.

B.3024 December 2, 2023 — Glasgow, SCT, United Kingdom

I be find driving home at night terrifying as I have to drive on a fast road with bends in the country and sometimes find it hard to see

B.3025 December 2, 2023 — NANTWICH, ENG, United Kingdom

I've had experience of these dazzling headlights. I have to really slow down as I can never see my surroundings

B.3026 December 3, 2023 — Hickory Hills, IL

the new headlights are to bright! They are blinding!

B.3027 December 3, 2023 — Johnson City, TN

These new LED lights are so bright!!!

B.3028 December 3, 2023 — London, KY

I was almost killed cause I was blinded by the LED headlights on a vehicle. Please do something about these headlights. No one needs headlights as blindly bright as they are.

B.3029 December 3, 2023 — Marshall, WI

LED lights are blinding and make night driving a dread. I often cancel plans or leave before dark to avoid vehicles on the road that have LED lights.

B.3030 December 4, 2023 — Moira, ENG, United Kingdom

I've had to slam my on breaks on on numerous occasions simply because I couldn't see anything ahead other than the dazzling headlights, they are very dangerous. Even more so in the rain when you are trying to avoid potholes. Plus, having such bright lights can make drivers less cautious when driving along unlit roads, making them even more of a hazard.

B.3031 December 5, 2023 — West Chester PA, PA

I am sick of being blinded and rendered unsafe by cars in the other lane. It's incredibly unsafe and inconsiderate.

B.3032 December 6, 2023 — Atlanta, GA

My eyes are highly sensitive to light, and the intense brightness, akin to high beams, illuminates my entire vehicle, blinding me. Consequently, I have to turn all my mirrors away to divert the light from my eyes, which poses a safety risk as I lose the functionality of my mirrors. In such situations, I find it necessary to pull over to the side of the road and allow the vehicles with bright lights to pass. This can

be perilous, and it's crucial for people to comprehend the impact these bright lights have on the driver ahead, surpassing even the disturbance caused by emergency blue flashing lights.

B.3033 December 6, 2023 — North Adams, MA

This shouldn't even be needed. These things are dangerous, whether you're going toward them or if they're in your rear-view. They need to GO AWAY!

B.3034 December 6, 2023 — North Haven, CT

It's so dangerous to drive at night when you are literally blinded by oncoming cars constantly!

B.3035 December 6, 2023 — Philadelphia, PA

The new lights are brighter than a high beam, making it very dangerous. Specially at night, we can't even see the roads because of these lights. Please just STOP.

B.3036 December 6, 2023 — Rocky Point, NY

Led headlights are dangerous

B.3037 December 6, 2023 — West Palm Beach, FL

These extremely bright headlights - especially on these huge trucks and SUVs are dangerous.

B.3038 December 7, 2023 — Saint Petersburg, FL

It getting is increasingly hard and uncomfortable to drive at night with more and more cars having blinding headlights. I worry that it could affect my safety, or safety of others.

B.3039 December 7, 2023 — Siloam Springs, AR

The new LED headlights have gotten out of hand. They make driving at night especially hazardous.

B.3040 December 8, 2023 — Anchorage, AK

Tired of being absolutely fucking blinded on roads

B.3041 December 8, 2023 — Long Beach, WA

Get rid of the blue headlamps completely, please.

B.3042 December 8, 2023 — San Antonio, TX

i see lights like this all the time and it never gets old. there's been multiple times i haven't been able to see because a huge truck was behind me with their lights blaring. it's unsafe, and it can cause wrecks and dies cause wrecks all the time. nobody is going to stop using them, so we should definitely ban them. i get the appeal of wanting to be able to see better at night. but over the safety of others? no

B.3043 December 9, 2023 — Los Angeles, CA

I'm 28, with no vision issues, and I still hate these blinding headlights.

B.3044 December 11, 2023 — Arlington, VA

I want to be safe in the roads at night when I drive my kids in our low to the ground station wagon!

B.3045 December 11, 2023 — Auburndale, MA

Of course! And postal delivery trucks are the worst offenders

B.3046 December 11, 2023 — Birch River, WV

I have been blinded by these lights also and have nearly been into accidents. I think people are able to see just fine with our old headlights and if they can't then maybe they should not be driving at all.

B.3047 December 11, 2023 — Clermont, FL

These lights are blinding to other drivers, incl me, which makes driving more dangerous than it already is.

B.3048 December 11, 2023 — Hinesburg, VT

The "new" headlights are too bright. When confronted w them, my eyes do not adjust to nighttime normal light levels. This is a particularly serious issue when driving through unlit places such as rural

roads and many town streets. Also, w the driving field lit so brightly in front of drivers who have these lights, a cave effect is created, thereby they cannot see to the left or right where there could be an animal, a person, a stalled car.

B.3049 December 11, 2023 — New York, NY

The blinding light is unbelievably dangerous and creates unnecessary hazards for all on the road.

B.3050 December 11, 2023 — Oakland City, IN

I agree. They say its safer for people because it allows them to see but what about those are blinded. Someone said that it looks like everyone has their brights on. There's the point when you are in traffic your lights aren't on bright and away from traffic on bright to see better. We don't need brighter lights for the low beam. Make the high beam bright to see better when your in the dark not in traffic.

B.3051 December 11, 2023 — Orlando, FL

Regulation & enforcement needed.

B.3052 December 11, 2023 — Richland, WA

I agree!

B.3053 December 11, 2023 — West Islip, NY

Too much glare at night.

B.3054 December 12, 2023 — Northampton, MA

I have almost sworn off driving at night due to the dangers of glare.

B.3055 December 12, 2023 — Norwood, MA

Blue/ super white lights make very difficult to drive at night

B.3056 December 12, 2023 — Roanoke, VA

Safety issue…I can’t see when I’m driving and cars coming at me blind me.

B.3057 December 12, 2023 — Shreveport, LA

It's ridiculous I have to wear sunglasses at night and it's still too bright. I can't file suit against them since I'm in a ditch…dead.

B.3058 December 13, 2023 — Albuquerque, NM

It’s becoming impossible to leave my house at night…I live off a two lane highway and often have to pull off the road.

B.3059 December 13, 2023 — Ashland, KY

Too many bright lights not properly aimed, but blinding me from front or rear. I travel on twisty road, and lots of deer roaming about.

B.3060 December 13, 2023 — Desert Hot Springs, CA

These lights are so dangerous at night when someone has a light case of night blindness these bright lights make things a lot worse.

B.3061 December 13, 2023 — Huntsville, AL

These lights blind you and keep you from seeing correctly.

B.3062 December 13, 2023 — New york, NY

Safety of my family

B.3063 December 13, 2023 — Otley, ENG, United Kingdom

Halogen lights on other vehicles make driving dangerous for other road users. My child is AUTISTIC and she gets distressed in the car, when we are driving in the Winter, or in low light conditions, when other road users have these blinding headlights. They are unnecessary and dangerous.

B.3064 December 13, 2023 — adrian, MI

I'm tired of being blinded

B.3065 December 14, 2023 — Ashford, ENG, United Kingdom

Every day I am blinded driving on dark country lanes by these lights that are too bright. It is seriously dangerous

B.3066 December 14, 2023 — Chelmsford, MA

They need to be banned. They are blinding when driving. Not safe at all.

B.3067 December 14, 2023 — Falls Creek, PA

If ANYBODY Needs THAT BRIGHT Of Blinding Headlights To See The Road When Driving At Night, They Shouldn't Be Driving AT ALL In The First Place. People Need To SLOW DOWN When Driving At Night, Especially In High Traffic Areas, Or ANYWHERE For That Matter. Simply OUTLAW The Bulbs And Have Them Replaced With The Traditional Yellow Bulbs At Safety Inspection Time, Or The Driver Gets Ticketed. Problem Solved REAL FAST...

B.3068 December 15, 2023 — Brooklyn, NY

I agree. They are blinding both coming at you and when behind you. I see these lights for sale everywhere. Why?!

B.3069 December 15, 2023 — Danvers, MA

It's outrageous. And I can't see at night

B.3070 December 15, 2023 — Lymington, ENG, United Kingdom

They are absolutely blinding & make it unsafe to drive.

B.3071 December 15, 2023 — North Walsham, ENG, United Kingdom

I wholeheartedly agree. These ridiculous LED car lights NEED to be banned. So dangerous and so unnecessary. They also cause long term damage to our eye sight, damaging the retina. I've often had to break sharply as the road ahead can't be seen because of oncoming cars with these blinding lights. Even cars behind blinding me with their LEDs shining into my rear view mirror. And driving far too close on country roads, being so impatient... but that's for another petition!

B.3072 December 15, 2023 — Rhinelander, WI

I would rather hit a deer than oncoming traffic! I cannot see, both when traffic is coming at me and when a car with these lights is behind me! The idea that now there will be glass that dims the glare on these lights is ludacris. When does it end? Insane. Nobody is landing a freaking 747 and testing these on an empty track? Come on. Get rid of these LED lights.

B.3073 December 16, 2023 — Flushing, MI

I have a car and have experienced this "blinding", especially when I approach a truck or SUV coming toward me in the opposite lane. I have had several near misses. This needs to corrected ASAP. What were the car manufacturers thinking?????

B.3074 December 16, 2023 — Orlando, FL

I'm tired of the recent trend toward blinding oncoming headlights!

B.3075 December 16, 2023 — Toccoa, GA

I'm tired of being blinded constantly at night because of these overly bright headlights. Also some of the drivers of cars with these headlights are inconsiderate to others when parking in lots by leaving them on while parked in front of you. Many of them also tailgate you and the lights are so bright in your mirrors it makes driving very dangerous.

B.3076 December 16, 2023 — West Newton, MA

I hate the blinding blue led lights especially!

B.3077 December 17, 2023 — Allegany, NY

I feel that the trend of ultra white bright headlights are a serious safety hazard.

B.3078 December 17, 2023 — Dallas, TX

I'm a trucker and I don't want to kill anybody because of overly bright headlights. It's so sad that the. FMCSA and the DOT are playing games with you and I and refuses to testify in front of the world and in front of bright blinding headlights with their eyes wide open staring into the beast they unleashed upon the world. I would gladly make a mobile light system with the maximum limit they allowed which is 75,000 luminous power just to see how long their eyeballs last as they testify.

B.3079 December 17, 2023 — MCMECHEN, WV

They are blinding to oncoming traffic.

B.3080 December 17, 2023 — Portland, OR

Personally tired of being blinded by these lights while driving.

B.3081 December 18, 2023 — Canmore, Canada

I like to be able to see where I'm driving at night. LED headlights are the worst

B.3082 December 18, 2023 — Kihei, HI

Road fatalities, dead birds, eye stabbing lights. Enough is enough!

B.3083 December 18, 2023 — Sterling, VA

These headlights have been a problem for me, also. I support this effort.

B.3084 December 18, 2023 — United States

The brightness makes it quite difficult to see anything else.

B.3085 December 19, 2023 — Miami, FL

Hi Annette, Halogen on Low Beam is actually Much better than LEDs as far as being safer for Everyone. The nature of LEDs being such a dense and directional form of light is the reason that we're up in arms.

B.3086 December 19, 2023 — San Diego, CA

Those lights hit you right in the face and make it impossible to see!! Please fix this!!!

B.3087 December 19, 2023 — Tooele, UT

I can't stand the halogen headlights! They give me a headache and make my night blindness so much worse.

B.3088 December 20, 2023 — Acushnet, MA

I feel that I can't safely drive at night. This impacts my social life greatly. I used to go to meetings and was involved in the community and events.

B.3089 December 20, 2023 — Brooklyn, NY

Those headlights make it so I can't see shit. That's why

B.3090 December 20, 2023 — Milford, CT

I stand for this!

B.3091 December 20, 2023 — Narberth, PA

I have astigmatism in both eyes and driving at night is brutal due to the headlights.

B.3092 December 20, 2023 — Pittsburgh, PA

{"videoUrl":"https://stream.mux.com/JwVw3OlJkRA302As4pDefGWdDI02dRwd1f00pXJnu5u2Xw","cloudflareUid":"4abfad0cf843df61086012d7df42b1e2","muxAssetId":"isZbA6u7IepSQVxnO3r01QotGvI3GSAxOjduy8rpA02Ko","muxPlaybackId":"JwVw3OlJkRA302As4pDefGWdDI02dRwd1f00pXJnu5u2Xw","muxPlaybackUrl":"https://stream.mux.com/JwVw3OlJkRA302As4pDefGWdDI02dRwd1f00pXJnu5u2Xw","muxThumbnailUrl":"https://image.mux.com/JwVw3OlJkRA302As4pDefGWdDI02dRwd1f00pXJnu5u2Xw/thumbnail.jpg"}

B.3093 December 20, 2023 — Springdale, AR

I have noticed over the last 10 years or so a lot of extra bright, blue tinted headlights. They cause pain in the eyes since blue is a color the eye is sensitive to and they are dangerous since after car has passed your eyes have shrunk the amount of light allowed into the eye so it takes a minute or so to regain your normal night vision.

B.3094 December 20, 2023 — Wall Heath, ENG, United Kingdom

Headlights are so incredibly intense these days, especially on dark country roads. I am scared to drive at night now.

B.3095 December 20, 2023 — Woburn, MA

Let's go back to when we cared about the other people on the road. Also must band auto adjust as it doesn't work fast enough. Been getting blinded by these ultra bright lights that exceed my high beams. It's dangerous. How did the USDOT miss this??? Negligence on there part to the highest degree!

B.3096 December 21, 2023 — Austin, TX

I am constantly blinded at night by these new headlights! And i am young with good vision except for some astigmatism.

B.3097 December 21, 2023 — Brookville, IN

Xenon headlights are extremely bright and blinding, if you can't use your cellphone while driving because it is a distraction from the road, then why are these headlights allowed when they distract/blind other drivers?

B.3098 December 21, 2023 — Gateshead, ENG, United Kingdom

The lights are blinding and darken visibility around us. We don't need these lights!

B.3099 December 23, 2023 — Richmond, VA

Duh!

B.3100 December 23, 2023 — Saddle Brook, NJ

Blinding headlights are simply dangerous. We need regulation to limit how bright headlights can be.

B.3101 December 24, 2023 — Dorval, Canada

Unsafe.....what if a bicycle is in front of me and I'm dazzled by these led lights

B.3102 December 24, 2023 — Jacksonville, FL

This is very dangerous gives me massive headaches. I feel like car inspections should come back and testing headlights should be one of the items that drivers either have to fix or no be allowed to have those cars on the road.

B.3103 December 25, 2023 — Casco, ME

Donna Shaw

B.3104 December 25, 2023 — Indianapolis, IN

I can barely drive at night anymore.

B.3105 December 25, 2023 — Oakdale, PA

In the last year alone, I have noticed an upturn in being blinded by overly bright headlights or high beams. I'm exceptionally tired of having to adjust my rear view mirror or side mirrors to stop being blinded.

B.3106 December 27, 2023 — Frimley, ENG, United Kingdom

It is interest of safety

B.3107 December 27, 2023 — Nanticoke, PA

It's crazy. I counted six headlights on a truck the other day. Maybe these are meant to be pavement princesses, but this amount of light suddenly can literally stun you if it comes over a hill fadt.

B.3108 December 28, 2023 — Hillsboro, OH

I'm tired of being blinded at night my extremely bright headlights. And my eyes are not overly sensitive.

B.3109 December 28, 2023 — North Bennington, VT

I am signing because I have eyes and wish not to be blinded and driven off the road after staring at two, small orbs which cast light so boiling hot that they may as well be two small suns.

B.3110 December 28, 2023 — Nottingham, MD

I just drove the most horrific night drive of my life with blinding headlights and rain making me worry if we would make it home alive. Tons of accidents on the interstate. These blinding lights make it so much more difficult to see the lines.

B.3111 December 29, 2023 — Bent Mountain, VA

I was forced to stop in heavy traffic when I was blinded by a truck with very bright headlights. Others were forced to stop as well. I feel lucky to have avoided an accident. This is not the first time.

B.3112 December 29, 2023 — Brooklyn, NY

These headlights are unsafe and unnecessary.

B.3113 December 29, 2023 — Olyphant, PA

These bright headlights make it difficult for me to drive at night. Blinding!

B.3114 December 30, 2023 — Oceanside, NY

I know LED's are better, however they need to be checked for brightness and blue light. Make them less bright and more yellow/orange.

B.3115 December 30, 2023 — United States

I cannot see for these headlights coming at me. I fear for my life and the lives of others.

B.3116 December 30, 2023 — Vancouver, WA

I can't see when hit full on with those brights.

B.3117 December 30, 2023 — Wakeman, OH

New car's and SUV's and Truck's are a very blinding and distracting intensity and color…Make's me want to put my sunglasses on but as we know this can be Deadly.

B.3118 December 31, 2023 — Atlanta, GA

Im tired of being blinded for seconds on end while driving at night. It is a safety hazard and just unnecessary road bullying in my opinion.

B.3119 December 31, 2023 — bloomingdale, NJ

he aint lying!!!!!!!!!!!

B.3120 December 31, 2023 — washington, MO

I can't see when led headlights come toward me at night.

Comments left in 2024

January 2024

B.3121 January 1, 2024 — Belmont, CA

I have astigmatisms in both eyes as well as chronic migraines that are triggered by bright lights so this is an issue that is very important to me. Bright LED lights negatively affect me almost every day of my life. Additionally, these headlights have made my ability to drive on rainy nights virtually inaccessible to me due to their ability to essentially blind me.

B.3122 January 1, 2024 — Concord, CA

Driving in towards or in front of bright blinding lights is so dangerous, and my aging eyes can not adjust quickly enough to safely drive. BLINDINGLY bright headlights should be illegal. Aftermarket modifications should also be illegal.

B.3123 January 1, 2024 — Paauilo, HI

I can no longer drive at night due to the blinding headlights LED and Halogen headlights. This has curtailed my social life and employment hours and have led to social isolation and financial instabilty. How are these lights not illegal?

B.3124 January 1, 2024 — Portland, OR

For the love of god, we need something like this

B.3125 January 1, 2024 — Sapulpa, OK

I can't see when I drive at night because selfish people drive cars with unregulated headlights that blind others while lazy government officials do nothing to correct a public safety hazard.

B.3126 January 1, 2024 — Seattle, WA

These ridiculously bright headlights leave me partially blinded and I'm worried it will lead to me hitting a pedestrian. I feel like I'm being assaulted everytime I drive at night, and sometimes even during the middle of the day by vehicles 2-3 blocks away. The attempts to refine headlight adaptive technology is a waste of time for anywhere that isn't perfectly flat at all times, such as in Seattle where I live.

B.3127 January 1, 2024 — Victoria, Canada

These super bright lights are blinding me so much as to making my driving at night very scary and dangerous to me and others

B.3128 January 2, 2024 — Beverly Hills, CA

Ok listen up everyone reading this. I have some cold hard facts to say and what I have resorted to doing First the cold facts A petition won't do anything this is a company that does what it wants. Which brings me to fact 2 Contrary to what anyone thinks or says, LED's are actually not legal on headlights. The companies just went ahead and did it as there is no recourse. Just like cops do things that aren't legal, they just go ahead and do it anyway. What are you going to do? Oncoming isn't the real problem either. The real danger is from behind you which impairs all vision. Oncoming is still dangerous but behind is completely lethal Here is what I have resorted to doing. I encourage everyone else to do the same. Because this problem is so bad I have resorted to keeping a pretty large highly polished 2-way mirror in my vehicle which I put up any time some idiot with this hazard is behind me. I'm also on the verge of covering the outside of my vehicle with mirrors

B.3129 January 2, 2024 — Beverly Hills, CA

Ok listen up everyone reading this. I have some cold hard facts to say and what I have resorted to doing First the cold facts A petition won't do anything this is a company that does what it wants. Which brings me to fact 2 Contrary to what anyone thinks or says, LED's are actually not legal on headlights. The companies just went ahead and did it as there is no recourse. B.3130 January 2, 2024 — Cheltenham, ENG, United Kingdom

I no longer drive very far at all at night due to these oncoming glaring headlights; some are not merely 'individual' headlights but ones which light up most of front AND rear of newer cars! Yes, I am an older driver but I know of many people considerably younger than I am who feel the issue of oncoming glaring/blinding headlights is not just annoying but downright dangerous!

B.3131 January 2, 2024 — United States
These lights can suck my dick

B.3132 January 3, 2024 — Holley, NY
HID's don't help the driver see better, they're only more blinding to incoming traffic. Gotta go.

B.3133 January 3, 2024 — IN, United States
Blinding headlights are really blinding in the night making me scared to drive.

B.3134 January 3, 2024 — Irving, TX
Save lives

B.3135 January 3, 2024 — Phoenix, AZ
It is blinding and dangerous to have head on traffic have these bright lights on.

B.3136 January 3, 2024 — Salt Lake City, UT
Solutions exist. We have the technology for safer roads and saving lives! For example, european headlights are safer. https://www.automotive-fleet.com/329713/europes-adaptive-beam-headlights-rate-highest-aaa-says

B.3137 January 3, 2024 — San Francisco, CA
I could no longer drive at night because of these blinding lights. Please ban them now.

B.3138 January 3, 2024 — San Francisco, CA
It’s difficult to drive at night with these blinding lights

B.3139 January 3, 2024 — United States
When blinding LED headlights are coming toward me, or any other driver, it makes it harder to see things like bikes or pedestrians, or animals. If all I see is the glaring headlights I may not know if I need to slam on the brakes for something else. Think about it! Just because you can't see something does not mean it's not there. #banblindingheadlights #banledandotherblindingheadlights

B.3140 January 3, 2024 — United States
I've literally had to stop my car in middle of St because I was blinded so bad and continue to be blinded by tree lighs

B.3141 January 3, 2024 — Washington, DC
My husband cannot go out at night anymore due to the blinding lights. I cannot see to drive in the dark. It is insane that I cannot drive at night. I will do whatever it takes to help get car manufacturers to return to sane lights. What do you suggest?

B.3142 January 4, 2024 — Calgary, Canada
LEDs area absolutely NOT needed

B.3143 January 4, 2024 — Granby, CT
I have always noticed that bright LED lights cause eye pain and make it harder to safely see the road at night. I'm glad to support this petition!

B.3144 January 4, 2024 — Irving, TX
Living in the country with no street lights, I can not stand these LED lights! I have to look at the solid white line on the side of the road in order to know where I am going when I pass someone with these lights. There is no way of knowing what is in front of me and it is terrifying! If police can pull you over for not turning your bright lights off, LED lights shouldn't even be available!

B.3145 January 4, 2024 — Monroe, WA
This affects us every day. I have to look away from the road or take a hand away from what I'm doing to block my eyes. It is painful, it is dangerous, it is very common. Fix this dangerous frustrating issue.

B.3146 January 4, 2024 — San Francisco, CA

It's past time someone did something about this! Thank you for this petition.

B.3147 January 4, 2024 — Seymour, IN

I like to be able to see while driving.

B.3148 January 4, 2024 — Sun Valley, NV

There is also the issue of people with fog lights that have been upgraded to the brighter lights and having them on along with regular headlights. Also headlights that are not adjusted or aimed correctly.

B.3149 January 4, 2024 — sanfrancisco, CA

They are dangerous to other drivers coming toward them. They are blinding.

B.3150 January 5, 2024 — Camden, NJ

I am personally so tired of driving at night and then being blinded by someones LED headlights. Its to the point where some of them are so bright that it momentarily blinds me and I am unable to see the road. Like do you want me to crash ??? I might if these damn headlights still exist.

B.3151 January 5, 2024 — Columbus, MI

This is not only prevalent on vehicles but is prevalent on buildings now especially gas stations party stores in large stores they're putting on these large LED panel lights versus what they had prior claiming probably being sold on the fact that they're saving money and get more lighting. Every city has lightning laws and they're not being followed everybody should be calling their engineering department we're planning commission or city console complaining on these lights. Ignorance is playing a big role here we have too much light pollution as it is it's really way out of control!

B.3152 January 5, 2024 — Gretna, LA

I'm tired of being blinded every time I drive.

B.3153 January 5, 2024 — Irving, TX

yes, near accident after lifted truck head lights bounced back from every rear view mirror at a Y-intersection at highway speed. I made the corner by feel alone and missed going onto shoulder, into concrete piers.

B.3154 January 5, 2024 — Knoxville, United States

I have an astigmatism and these lights BLIND ME. I'm tired of driving and feeling unsafe.

B.3155 January 5, 2024 — Oklahoma City, OK

I am very disappointed in the relatively uncaring attitudes among lawmakers and law enforcement agencies. Article after article tells us that the era of bright LED headlights is coming to an end. Really? I say it is only getting worse. With politicians sitting around on their hands, not doing anything to help their constituents, and local police forces not enforcing safety violations, it's no wonder citizens are not only concerned, we are boiling mad.

B.3156 January 5, 2024 — Ottinge, United Kingdom

I've had to stop driving at night due to being blinded by these ridiculous bright lights, due to a bad experience, which means my life is severely curtailed and affecting what I do for my family. It's far too frightening to attempt any night driving, and anything I do has to factor in getting home before it gets dark.

B.3157 January 5, 2024 — Portland, ME

I've felt blinded by on coming trafic on highways

B.3158 January 5, 2024 — Warrensburg, MO

First and foremost, driving at night has become a truly dangerous experience. I have been driving for over 20 years now and there is an absolutely noticeable difference in night time driving. Headlights are absolutely blinding. Additionally, anyone living on a street now have to deal with this blinding

lights assaulting them at all hours of the night. Aside from the existential threat that headlights pose to drivers we are creating a type of pollution that affects all life on this planet. Migration patterns are disrupted, the beautiful lightning bugs of my childhood are disappearing, and humans can no longer look up at the night sky and see the stars. All of this adds to an increasing feeling of disconnection from each other and our universe. This is no small issue. It needs to be taken serious. Even selfish interests could argue that the death toll from vehicle accidents alone detract from consumers spending money. Do something about this now.

B.3159 January 6, 2024 — Boise, ID

I'd like to avoid dying! Super bright headlights coupled with jacked up vehicles equals disaster for normal motorists.

B.3160 January 6, 2024 — Fargo, ND

Fuck your bright ass headlights, nerd

B.3161 January 6, 2024 — Fargo, ND

LED lights, especially high intensity, blind everyone on the road except for those lucky enough to have a 12in lift kit. You're supposed to look at the white line for those guys, but their lights are so bright the rays, halos, and fogginess takes up my whole field of vision. Just keep driving straight and pray

B.3162 January 6, 2024 — Garner, NC

Driving at night no longer feels safe, and I'm far from elderly.

B.3163 January 6, 2024 — Glendale, AZ

These LED lights are blinding to people/cars coming the opposite direction. It's all you can see is the glare from their headlights and not much of anything else. Please go back to traditional headlights!!

B.3164 January 6, 2024 — Knoxville, TN

{"videoUrl":"https://stream.mux.com/V5P01gPAxm2VMrmY02zoE3rvP1umjtqPIghBjmnnJRFaY","cloudflareUid":"a84ab46824a896f3f4682f9ba1eb88f1","muxAssetId":"GlNgCrrhE01vLWTLRdaCOugSeG2S33R01j1aIvuIJd21U","muxPlaybackId":"V5P01gPAxm2VMrmY02zoE3rvP1umjtqPIghBjmnnJRFaY","muxPlaybackUrl":"https://stream.mux.com/V5P01gPAxm2VMrmY02zoE3rvP1umjtqPIghBjmnnJRFaY","muxThumbnailUrl":"https://image.mux.com/V5P01gPAxm2VMrmY02zoE3rvP1umjtqPIghBjmnnJRFaY/thumbnail.jpg"}

B.3165 January 6, 2024 — Louisville, KY

It's not just the LEDs it's the people who don't turn their brights off for traffic in front of them or on coming traffic! Y'all need to learn to drive!

B.3166 January 6, 2024 — Minneapolis, MN

The proliferation of blinding, too-bright, poorly-adjusted headlights is clearly making travel more dangerous. Not only for the sake of drivers, but also for cyclists and pedestrians, who are being killed with increasing, alarming frequency on American roads. I can hardly go out at night anymore without being blinded by oncoming traffic.

B.3167 January 6, 2024 — Spokane, WA

These lights are hazardous and drivers who use them should be ashamed

B.3168 January 6, 2024 — St. Cloud, MN

I live in the north where it gets dark by the time I get off work. With these headlights blinding me I essentially can't run errands after work for half the year. This was never an issue before these blinding lights made it impossible to see, both oncoming traffic blinding my left and from behind where it removes an ability to use my mirrors and destroys my night sight.

B.3169 January 6, 2024 — St. Cloud, MN

{"videoUrl":"https://stream.mux.com/02ga6eb1XK4Xr2moPQLRSDRPdN9iVIbryOERvuUHpjAk","cloudflareUid":"d4ddd62a3dfadcb5f1

ef912148377078","muxAssetId":"YdaXmeSHK5vOc6UyhoFIY8Q013kOHjBIqGlTe63li02TY","muxPlaybackId":"02ga6eb1XK4Xr2moPQLRSDRPdN9iVIbryOERvuUHpjAk","muxPlaybackUrl":"https://stream.mux.com/02ga6eb1XK4Xr2moPQLRSDRPdN9iVIbryOERvuUHpjAk","muxThumbnailUrl":"https://image.mux.com/02ga6eb1XK4Xr2moPQLRSDRPdN9iVIbryOERvuUHpjAk/thumbnail.jpg"}

B.3170 January 7, 2024 — Georgetown, OH

These taller vehicles even leave their brights on when passing other vehicles because lights from other cars dont affect them due to them being lower. When driving a smaller car, it makes hitting deer or other unexpected objects unstoppable. It’s a serious issue and I feel like nobody talks about it.

B.3171 January 7, 2024 — Naugatuck, CT

Headlights need to be regulated again. Wouldn't mind seeing seal beam headlights reintegrate into modern cars.

B.3172 January 7, 2024 — Normal, IL

PLEASE MAKE THIS FEDERAL. THE LIGHTS ARE TOO BRIGHT AND CAN DAMAGE THE EYES.

B.3173 January 7, 2024 — Saint Petersburg, FL

Testing headlight aim used to be part of the emissions inspections in Florida. When they dropped the emissions testing they should have kept the headlight aim test and brake tests. No telling how many lives could have been saved.

B.3174 January 7, 2024 — Yucca, AZ

Yet another GLARING example of how inept the fed gov is, total disregard for the well-being of the people

B.3175 January 8, 2024 — Worcester, ENG, United Kingdom

I daren't drive at night with these blinding lights.

B.3176 January 9, 2024 — AR, United States

Even with night driving glasses, I am still blinded by the extremely bright LED headlights. I have sensitive eyes and literally cannot see the road as they pass by.

B.3177 January 9, 2024 — Clio, MI

The LED lights are seriously dangerous they need to be banned sooner than later! I become completely blinded as one is approaching me on the road until it's past me. During that moment I can't see the road I don't know if anything's in the road, I feel like my car swerving to avoid the lights. This you're not even be a factor anyone who thinks this is ok is delusional! It's a fixable problem! Let's get it fixed!

B.3178 January 9, 2024 — London, United Kingdom

I want to make driving safer for people.

B.3179 January 9, 2024 — North Augusta, SC

I love to drive, but hate to at night because of newer vehicles that have these ultra bright headlights.

B.3180 January 10, 2024 — Brentford, United Kingdom

When I drive across a steep bridge, I have to slow down drastically because the light from the oncoming vehicle blinds me

B.3181 January 10, 2024 — Hinckley, ENG, United Kingdom

I can no longer drive at night due to being blinded by these lightd

B.3182 January 10, 2024 — Irvine, SCT, United Kingdom

The lights are blinding and dangerous

B.3183 January 10, 2024 — Isle of Wight, ENG, United Kingdom

These lights are so bright they are dangerous.

B.3184 January 10, 2024 — London, United Kingdom

These lights are dangerous

B.3185 January 10, 2024 — Pittsburg, PA

These lights are terrible, they blind you when the car is oncoming and they blind all of your rearview mirrors when this monstrosity is behind you.

B.3186 January 10, 2024 — Rochester, NY

I can't see the road when these lights are coming at me. Some of them physically hurt.

B.3187 January 10, 2024 — Sheffield, ENG, United Kingdom

I want these LED headlights banned because they may cause fatalities on our country roads or any other roads. The cars are higher now and the lights blinding to incoming traffic.

B.3188 January 10, 2024 — Solihull, ENG, United Kingdom

It's dangerous driving in the night with lights blinding you as to cause an Accident. Urgent action should be implemented

B.3189 January 10, 2024 — london, Canada

I too have been blinded by the light

B.3190 January 10, 2024 — st John, ENG, United Kingdom

I think this is a growing problem, especially with the increased use of after market replacement bulbs. Accidents due to dazzle remain largely unprovable and hidden.

B.3191 January 11, 2024 — Cape girardeau, MO

I live in a larger city and many people have switched to blinding blue/white lights. I also struggle with astigmatism and night blindness. I have begun to completely avoid driving at night because of the amount of people that use these lights. There are huge amounts of oncoming traffic all with bright LED headlights that make it so I can't even see the lines on the road. I've almost gotten into multiple wrecks because of these lights and I'd like to be able to drive at night again.

B.3192 January 11, 2024 — Sherwood Park, Alberta, AB, Canada

Far to Bright ! Can't see at night !

B.3193 January 11, 2024 — Steeple View, ENG, United Kingdom

It's dangerous to drive and I've nearly had an accident due to not being able to see

B.3194 January 11, 2024 — Tucson, AZ

I'm sick and tired of being blinded while trying to drive at night.

B.3195 January 12, 2024 — Cardiff, WLS, United Kingdom

These lights are damaging and hurting my eyes

B.3196 January 12, 2024 — Kansas City, MO

I've read some of the studies that show humans need shadows and light contrast in order to see well. Other species are severely impacted by these too bright lights. These lights disrupt migratory birds, disturb mating, interfere with navigation, and cause numerous other health problems.

B.3197 January 12, 2024 — Mesa, AZ

Extremely bright headlights are literally the most dangerous thing on the road above intoxicated driving. It's come to the point where manufacturers are literally using lasers and other ridiculous technologies to make the brightest possible light that blinds everyone else but the driver, people with stigmatism and other eye problems can be left blinded for literally minutes. Manufacturers and people need to be held accountable so this can't stop

B.3198 January 12, 2024 — Poulsbo, WA

I am blinded daily! They need to change the headlights!! Meg Shaw

B.3199 January 12, 2024 — Sheffield, ENG, United Kingdom

They are blinding towards drivers travelling in both directions it should be made illegal

B.3200 January 12, 2024 — Woodstock, CT

I only drive at night if I have to. The increase in the LED lights has directly affected how much I patronize any business, especially in winter when it is dark all the time. Perhaps lawmakers care about the economic ramifications of horrendous travel conditions?

B.3201 January 12, 2024 — aylesbury, ENG, United Kingdom

Fed up of being blinded

B.3202 January 13, 2024 — Chicago, IL

Sucks driving through mountains and getting blinded by pickup trucks that feel to light the whole place up including my whole interior of my car. I'm surprised there isn't a ban on these yet knowing that even law enforcers most likely experience this too.

B.3203 January 13, 2024 — Dayton, OH

They blind me

B.3204 January 13, 2024 — Eureka, CA

It's absurd that these aren't outlawed already. WAY worse than brights, which ARE illegal to have "always on".

B.3205 January 13, 2024 — Fort Myers, FL

LED headlights are horrible. They Blind oncoming drivers even pedestrians or bicyclists. It takes seconds for my eyes to readjust. Also. If you have a LED headlight vehicle the color of light is not idea. I have bright white halogen bulbs in my personal vehicle and they light the road better in dry and wet conditions than BLUE led lights do. Everyday driving I always questioned who allowed these bulbs to be installed in vehicles. the HID- high intensity discharge headlight days were a time of bright lights but LED lights are FAR WORSE than the HID lights were

B.3206 January 13, 2024 — Kelvedon Hatch, ENG, United Kingdom

I'm beginning to be very concerned about night driving. The glare is so dazzling that the total ability of seeing clearly compounds the problem of avoiding pot holes at the side of the road

B.3207 January 13, 2024 — Marshfield, WLS, United Kingdom

I have been blinded many times by bright lights. I believe they cause too many accidents on our roads.

B.3208 January 13, 2024 — Scranton, SC

These lights are very blinding.

B.3209 January 13, 2024 — Sheffield, ENG, United Kingdom

I often struggle driving when it's dark due to other vehicle headlights

B.3210 January 14, 2024 — Chingford, United Kingdom

It's gotten to the point where I avoid driving at night completely because I find it so dazzling and cannot see. It's so unsafe!

B.3211 January 14, 2024 — Eden Prairie, MN

I am also having trouble driving at night. The new car headlights blind me

B.3212 January 14, 2024 — Little Hocking, OH

Those headlights are not only dangerous, but it is also stopping probably THOUSANDS of us frm going out at night, thus leading to ALSO damaging the economy, family ties, and MANY small businesses! I personally know at least 10 people who will no longer go out at night! They are even a drag in the daytime!

B.3213 January 14, 2024 — Llanidloes, ENG, United Kingdom

I find these lights really hurt my eyes, even in my mirrors when the car is behind me. This is bot only very distracting when I′m driving home after a 12 hour care shift, but, I believe, damaging to the eyes as well as stressful and unnerving for other road users. I believe this affects our safety and our wellbeing. Please please ban their use. Their benefits to the driver with this lights is far outweighed by the detriment they cause to others.

B.3214 January 14, 2024 — Logan, UT

You are correct, this is the reasons why people get blind.

B.3215 January 14, 2024 — Newtown. WALES, ENG, United Kingdom

I am finding it very difficult to cope with these very bright headlights which do not seem to bother to dip until the last minute

B.3216 January 14, 2024 — Waco, TX

I hate blinding lights like the song by The Weeknd

B.3217 January 14, 2024 — Wellingborough, ENG, United Kingdom

They are a menise and blinding

B.3218 January 15, 2024 — Downingtown, PA

It creates a hazardous nuisance, driving at night to be exposed to so much of this extreme brightness, especially on rural roads that are winding and narrow. Furthermore, it is predominantly well off people driving vehicles with these harmful lights, and this amounts to class warfare against all of us who cannot afford new cars, or have to drive at night for livelihood. It is disgusting, unjust, and needs to be corrected immediately. Please introduce and/or support some measures to eliminate this unnecessarily perilous trend in automobile design. Please make it a standard of a car being street legal to have below a threshold of brightness, as recommended and approved by eye doctors, as people with astigmatism are further harmed by this intense LED brightness. There is no legitimate reason car headlights need to be as bright as they are, and the auto manufacturers should be held responsible for the hazardous nuisances they are promoting. Make mandatory recalls for headlights above proposed safety thresholds. The accidents that could be prevented with updated headlight standards are reason enough to put this on your agenda.

B.3219 January 15, 2024 — Litchfield, ME

I am getting old and these light are blinding, I have to drive home around 8:30 every night and the lights make driving almost impossible

B.3220 January 15, 2024 — Northampton, MA

for a no. of years I have inreasingly been aaffec=ted by the many factors mentioned n this petition. I kept thinking these things would immediately be changed in the next year′s car models or not permitted by federal agencies that ,monitor safety in our cars, on oour roads, etc. But it is only gotten worse on a daily basis. This petition speaks to a terrible danger among us throughout the country as proven by our growing death toll. It is already too late for many but will help everyone if some of the suggested actions are implemented now and by federal law.

B.3221 January 16, 2024 — Desoto, MO

These lowbeams, are brighter than my highbeams, and highbeams aren′t supposed to be used within 500 ft of another car, weather meeting head on, or following. Some drivers have more sensitive eyes. They should be illegal, and tickets should be handed out like candy. It′s also very disrespect and causing road rage!

B.3222 January 16, 2024 — Niceville, FL

I want to be able to drive at night without guessing where the painted lines start and end because all I see is blinding light

B.3223 January 16, 2024 — Pataskala, OH

There has been to many nights, especially in snow or rain where I have almost driven off the road due to the LED headlights. They are too bright! The fact that I can't tell between their brights and normal headlights is so dangerous. They need to be illegal before they cause more accidents.

B.3224 January 17, 2024 — Frisco, CO

I like being able to see.

B.3225 January 17, 2024 — Gig Harbor, WA

Have been affected myself by this issue

B.3226 January 17, 2024 — Minneapolis, MN

Someone had led lights coming the opposite way from me, I couldn't see the road only the headlights in front of me. It was icy and snowing really bad and I ended up crashing with my 4 year old niece in the car.

B.3227 January 17, 2024 — Nashua, NH

The too bright headlights are dangerous!

B.3228 January 17, 2024 — Panama City, FL

very dangerous for people like myself with macular degeneration. it's already difficult to see at night, add these headlights and all one can see is just a white out view. I also believe part of the reason for these headlights is the addition of electronics inside the cab of the vehicle. Large infotainment displays make it difficult to see at night so auto makers compensate by making the headlight brighter. These high intensity lights are absolutely dangerous.

B.3229 January 17, 2024 — Portland, OR

I'm a rideshare driver and I get headaches from driving long hours at night with all the LED headlights. Not to mention that there are times when I can barely see the road because of oncoming or tailgating vehicles with blinding headlights. There's no reason for a vehicle to have the equivalent of high beams by default.

B.3230 January 17, 2024 — Seattle, WA

I am effected by this every night

B.3231 January 17, 2024 — Tomball, TX

As someone with Visual Snow and resulting light sensitivity, the new LED's are extremely painful and have made driving at night a terrifying experience. Please do something about this. I know states like Maryland could easily incorporate this into their already strict vehicle inspection processes.

B.3232 January 18, 2024 — Fairborn, OH

I can't drive at night anymore without being blinded. This is dangerous and needs to change.

B.3233 January 18, 2024 — Fox Lake, IL

If you drive with bright LEDS at night that can blind people I hope you get struck at night by a car and see all your family members breathe their final breaths you beta cucks.

B.3234 January 18, 2024 — Lockport, NY

Driving is hard enough. These headlights are out of control and make something most of us must do so much more difficult and dangerous than it needs to be.

B.3235 January 18, 2024 — London, ENG, United Kingdom

I'm finding night driving almost impossible Have some anti glare glasses that help a bit

B.3236 January 18, 2024 — Mendota, IL

I don't drive at night because when I do I literally almost go off road when being blinded by these intense head lights. I drive an svu (bulb lights) and still am blinded. Please do something before people start dying because of them.

B.3237 January 18, 2024 — Paignton, ENG, United Kingdom

I avoid driving at night if I can because of these cars .

B.3238 January 18, 2024 — Winchester, United States

I have a huge sensitivity to light and can barely drive at night without getting into an accident because of bright headlights.

B.3239 January 18, 2024 — Yarmouth, ENG, United Kingdom

I live in a rural community, without street lights, and am frequently dazzled by these bright lights, especially coming over a hill. On occasion I have been so blinded I′ve almost had a ln accident! I′ve had to apply emergency brakes and stop entirely until my vision cleared. In addition there are so many potholes locally, I am blinded every time an incoming car hits one,!

B.3240 January 19, 2024 — 29 Palms, CA

This is a real danger every time we drive.

B.3241 January 19, 2024 — Collingswood, NJ

These headlights blind me, making it hard to see the road while they approach me, and after they pass, as my eyes readjust. In my small town with pedestrians, if one were step out into the street to cross, I wouldn’t see them because of these headlights. It’s a disaster waiting to happen.

B.3242 January 19, 2024 — Duluth, MN

LED lights have triggered so many migraines and negatively affected my ability to work because of it.

B.3243 January 19, 2024 — Fortuna, CA

The wide spectrum of light allowed for use in headlights need to be addressed with scientific studies to verify the safety of headlights that are in the blue(UV) shifted light. They are blinding and make it incredibly unsafe on the road, with an emphasis on members of the community that wear glasses. The safety rules I′ve used in the past no longer work as the beams of light from UV-shifted LED headlights leave floating blind spots in an instant. It creates dangerous road conditions and some limitations should be instituted for safety reasons.

B.3244 January 19, 2024 — Halifax, Canada

This is getting ridiculous. I′m not for banning LED lights all together but they can′t allow the truck headlights, at eye level of the average car, to have these bright lights. The average car is below the cutoff shield of the tall trucks. I now carry a piece of cardboard covered in tape to hold up to these lights and have pointed my mirrors away from the other vehicles. All of this is making things more unsafe. I′ve wrote the safety board many times but always get the same response back.

B.3245 January 19, 2024 — Jasper, AL

I can′t see at night when the lights are so bright. Behind me an oncoming.

B.3246 January 19, 2024 — Palmer, AK

I ALMOST DIE DAILY DUE TO THE BRIGHTEST HEADLIGHTS IN THE WORLD.

B.3247 January 19, 2024 — Twentynine Palms, CA

These lights are blinding! It is a serious safety issue for oncoming drivers, especially on the dark, rural roads that we drive on to get home.

B.3248 January 19, 2024 — Twentynine Palms, CA

Those lights are dangerous!!

B.3249 January 19, 2024 — Williton, United Kingdom

I hate being blinded by such lights

B.3250 January 20, 2024 — Berkhamsted, ENG, United Kingdom

Headlights should be limited by lumens and brighter bulbs banned from sale. They dazzle, and retinal afterglow at night still makes driving unsafe for several seconds after being seen.

B.3251 January 20, 2024 — Burlingame, CA

There's no need for LED lights. The old ones were good enough for all those years.

B.3252 January 20, 2024 — Milwaukee, WI

I want to be able to use my eyes properly on the road

B.3253 January 20, 2024 — Seattle, WA

Factory installed binding lights is reckless and should be outlawed and car manufacturing corps sued. Blinding lights cause crashes and deaths. Recall all cars with such lights and ban them!!!

B.3254 January 20, 2024 — Wellington, New Zealand, New Zealand

LED headlights are blinding for other drivers and this can get people KILLED.

B.3255 January 21, 2024 — DC, VA

I definitely hate driving at night because of these bright lights. Once it hits my eyes while driving I can't see for a couple of seconds. Which is bad because I could get into an accident. I've had to even get anti-glare glasses to see at night because my vision has gotten worst due to the bright lights blinding me.

B.3256 January 21, 2024 — Las Vegas, NV

I live in the city and gave to use my hand to block unwanted glare and try to focus on the ground ahead of me to be able to see and continue driving. This happens several times a day in the dark winter hours. It's blinding and I barely can see and have my eyes hurt while trying to get past those lights. It's a cost-saving measure from manufacturers and not worth it! They need to STOP being cheap!

B.3257 January 21, 2024 — Seattle, WA

Ban Blinding Headlights and Save Lives! Auto makers have been putting dangerously bright lights on cars. They cause accidents and deaths!!!nIt is a great risk to drive at night any more!! Let's change that!!

B.3258 January 21, 2024 — Seattle, WA

I drive home at night in very secluded/wooded areas where there is little street light. If there are cars behind me (even from a great distance) it is difficult for me to see what is ahead. Or if a car with LED lights is passing me, I'm literally blinded for a few seconds, and so many people keep their brights on as well!!! It is becoming dangerous to drive at night, it is giving me headaches driving with all this excessive light exposures, and makes me anxious.

B.3259 January 21, 2024 — Seattle, WA

Blinding headlights are getting out of hand recently and are causing an active danger to ALL drivers on the road. A lack of regulation for blinding headlights is a problem for ALL drivers.

B.3260 January 21, 2024 — Staten Island, NY

It's hard to see anything when oncoming traffic and the other side of the road has these lights, which makes a very blind and indificul To see in order to drive safely .

B.3261 January 21, 2024 — Watervliet, NY

I am someone with some neuro issues, these LED lights are so massively dangerous, they blind an entire road so when coming at you, you can't see the road ahead, and when behind you, it floods your whole car with lights. Ban these lights, bring back regular lights which are safer and more effective!

B.3262 January 21, 2024 — Yuma, AZ

I live in a city and on the way to the gym, giant trucks with LED lights frequently blind me. It's hard to see what what's in the adjacent lane and if I make a ill timed turn, I'm dead and who's at fault? The driver who had the bright lights

B.3263 January 22, 2024 — Lake City, PA

its really dangerous to keep those LED headlights on the road, its blinding!!

B.3264 January 22, 2024 — Liberty, MO

I've nearly been in accidents from blinding headlights

B.3265 January 22, 2024 — Liverpool, ENG, United Kingdom

It is Awfull trying to drive safely on the roads/motorways with these ridiculous unwelcome unneeded bright lights that blind you whilst trying to drive safely for yourself & others! Unessasary! Something needs to be done about the problem it's causing !!

B.3266 January 22, 2024 — Moncton, Canada

Led/hid head lights should be illegal

B.3267 January 22, 2024 — Oceanside, CA

If you can drive without the power of the sun strapped to your car then you're a crappy driver. Go back to the old headlights that aren't blinding people and causing accidents

B.3268 January 22, 2024 — Phoenix, AZ

Ban LED in headlights, regulate the amount of light that can be emitted or the angle of all lights so no light shines above a certain point, do something to prevent the dangerously bright lights on so many vehicles

B.3269 January 23, 2024 — Billericay, ENG, United Kingdom

It's dangerous and it will kill someone

B.3270 January 23, 2024 — Elgin, TX

Astigmatism already makes nighttime driving difficult, but the brightness of LED headlights especially when combined with their height in modern truck and SUV designs makes it blindingly dangerous. Even people with whom I have spoken without astigmatism agree that impairs their ability to drive at night. Headlights should not be full-spectrum and should instead focus on the more mellow yellow, orange, and red end of the light spectrum that are softer and more conducive to seeing at night. Their height in automobiles should be limited, and their angle should be standardized so that they are less prone to shining directly into other cars while behind them, passing them from the side, or driving in the opposite lane. This is a safety issue, and manufacturers will not fix it so long as it is not mandated and they can excuse it as simply doing what the customer wants.

B.3271 January 23, 2024 — Gainesville, FL

Fuck your Headlights.

B.3272 January 23, 2024 — Haughton, LA

I have trauma(iritis) to my eyes due the lights on these cars and trucks! We need to back to the old lights.

B.3273 January 23, 2024 — Syosset, NY

I need to hold up my left hand to block the super bright oncoming lights. So annoying and dangerous!!

B.3274 January 23, 2024 — Toledo, OH

I'm appalled at the brightness of LED headlights? WHY are they even legal? If a law is passed that would control the intensity that can be admitted, how will the existing vehicles that have them controlled?

B.3275 January 24, 2024 — Austin, TX

I've personally experienced being blinded by these headlights and the unsafe situation it puts many of us in while driving atnight.

B.3276 January 24, 2024 — Bangor, NIR, United Kingdom

There needs to be a minimum surface area for headlights, and a maximum lumen rating. Fancy adaptive tech is not the answer.

B.3277 January 24, 2024 — Louisville, KY

The headlights are blinding!!

B.3278 January 24, 2024 — Oakland, CA

I can't drive comfortable with these headlights .. they almost blind me! A rear hazard for night tine driving

B.3279 January 24, 2024 — Quakertown, PA

I am a good driver and I obey the traffic rules, much to the annoyance of other drivers . The headlights have me at times not knowing what is in front of me.

B.3280 January 24, 2024 — Summit, NJ

The increasing brightness of car headlights has gotten totally out of control. Just require lights with lumens over 2k to have adaptive technology to mitigate the effect on oncoming traffic

B.3281 January 24, 2024 — United States

Monster trucks behind my Prius are blinding even with the rearview switched to night view. It's gotten insane.

B.3282 January 25, 2024 — Avondale, AZ

I don't want to crash over some Ram truck tailgating me and blinding me with their LED lights

B.3283 January 25, 2024 — Charlotte, NC

Save lives.

B.3284 January 25, 2024 — Greeley, CO

I no longer drive at night unless absolutely necessary because of the blinding headlights that seem to be in the majority these days. It's great that those drivers can see, but those of us who are blinded by them have no choice but to not drive at night.

B.3285 January 25, 2024 — Houston, TX

Chevy pickups have 6. THATS 6 LED HEADLIGHTS ,ALL ON AT THE SAME TIME. HOW DOES THE DEPT OF PUBLIC SAFETY ALLOW THIS,???

B.3286 January 25, 2024 — Lanark, IL

Headlights now are brighter than the brights on the old incandescent system. I'm tired of being blinded and getting headaches just driving myself home after work. Please find a better way!

B.3287 January 25, 2024 — San Francisco, CA

I can't see!

B.3288 January 25, 2024 — Uniontown, OH

Headlights this bright both make driving more difficult and actually harm eyes

B.3289 January 26, 2024 — Cable, OH

I work third shift and driving to and from work every night is nightmarish. I've hit the shoulder so many times because I literally can't see the road due to how bright the headlights in the oncoming lane are. If it's foggy, I cannot see anything around these oncoming cars except this bright, white cloud.

B.3290 January 26, 2024 — Concord, NC

I just want to see the road.

B.3291 January 26, 2024 — Dartford, ENG, United Kingdom

The bigger the car the bigger the lights !! Bad enough on large roads but impossible on country lanes. I've been driving over 40 years and never needed Led lights before. Might be cheaper but with the overall cost of vehicles its hardly a reasonable excuse to blind half the nation

B.3292 January 26, 2024 — Fleming Island, FL

iv literaly cant see the road at night with these blinding lights, it hurts

B.3293 January 26, 2024 — Kutztown, PA

As someone who suffers from migraines, these lights are particularly awful. They have both induced migraines and exacerbated ongoing ones. There have been times where I've felt completely incapacitated and had to stop and park to close and rest my eyes for a while. If there are regulations on window tint or other additions to cars, then why not this?

B.3294 January 26, 2024 — Lansing, MI

Due to having an astigmatism in my right eye the led lights have literally made it nearly impossible to drive at night.

B.3295 January 26, 2024 — Longview, United States

Blinding on coming traffic is way more dangerous for the general public then the softer styles we have been using for decades.

B.3296 January 26, 2024 — Monterey Park, CA

I feel unsafe around cars driving with ultra bright lights

B.3297 January 26, 2024 — Montvale, NJ

I almost exclusively drive at night, And it's awful.

B.3298 January 26, 2024 — No, IL

I'm so sick of driving down the road with spots in my eyes from being blinded by every single ridiculously bright headlight that is perfectly eye-level in my car. It's ridiculous, painful, and more dangerous in the long run.

B.3299 January 26, 2024 — Olalla, OR

Safety

B.3300 January 26, 2024 — Rancho Cordova, CA

I'm so tired of being blinded on the road!

B.3301 January 26, 2024 — West Bend, WI

If I can see my cars' shadow because the car behind me's headlights are THAT bright then there is a massive problem. My astigmatism no longer allows me to drive due to these headlights. Even during the daylight they still blind oncoming traffic when on. Im going to start throwing rocks at oncoming cars headlights.

B.3302 January 26, 2024 — Weybridge, ENG, United Kingdom

Killing people

B.3303 January 27, 2024 — Albuquerque, NM

LED headlights are a blatant danger to the public, and the brightness levels of these headlights need to be regulated.

B.3304 January 27, 2024 — Atlanta, GA

It is hard to see at night when passing cars have their LED lights on. It is not safe and more accidents will occur. STOP MAKING LED LIGHTS!!!

B.3305 January 27, 2024 — Elma, WA

Even tail lights are leaving long lasting streaks in my vision. Streaks that I can't see through or around, leaving my vision impaired and myself distracted. These lights are dangerous.

B.3306 January 27, 2024 — Leechburg, PA

I have almost been in accidents multiple times due to being blinded by dangerously bright headlights. This is a very serious safety issue.

B.3307 January 27, 2024 — Longmeadow, MA

This is disruptive to night vision and dangerous

B.3308 January 27, 2024 — Phoenix, AZ

Headlights have been getting worse and worse as manufacturers try to make “cooler” headlights for their new car designs. It’s become so bad that I HATE driving at night these days. I try to focus on the white line on my side of the road, but still end up blinded momentarily…and as we all know, we’re traveling hundreds of feet during this momentary blinding. Regulate headlights - NOW!

B.3309 January 27, 2024 — Providence, RI

These headlights are dangerous. I am do relieved i am not alone.

B.3310 January 27, 2024 — Providence, RI

blinding headlights are dangerous!

B.3311 January 27, 2024 — San Francisco, CA

I'm consistently blinded by LED headlights, especially on Teslas. Please issue a recall to make these lights reasonable.

B.3312 January 27, 2024 — Xenia, OH

I can’t see at dusk, dawn and at night! It’s out of control!

B.3313 January 28, 2024 — East Longmeadow, MA

Ellen Bousquet

B.3314 January 28, 2024 — Mobile, AL

These headlights are extremely dangerous at night even on low beam. They need to be banned IMMEDIATELY!!

B.3315 January 28, 2024 — Muskegon, MI

I wish I could smash those lights with a baseball bat! Stop making them!

B.3316 January 28, 2024 — Phoenix, IL

Let me tell you how not good my vision is already I have 20/25 on my left side and a 30/25 on my right it's not real bad but my lenses are thick thick magnifying thick and my right eye actually used to be 20/25 but due to LED headlights is has worsened over the years mind you being 22!!!!!!!! I get floaters and black spots in my right field vision and my left eye is completely blinded by the lights I literally have to wear night driving glasses to make it at least 10% safer for me to actually be able to drive at all during the night. I have almost side swept guard rails or have slammed on my breaks because I am unable to see and in both scenarios have the potential of fatalities if it ain't me it's the driver behind me and I hope this finally gets pushed through quickly I don't want to see 500+ more fatalities before this is taken seriously.

B.3317 January 29, 2024 — Brooklyn, NY

I am So tired & annoyed by the blinding lights of oncoming cars at night,.whose owners are so inconsiderate to not bother adjusting the intensity.. and if that’s not the case there should be a way of adjusting them rather than putting peoples lives at risk! The lights are seriously blinding & can cause accidents!

B.3318 January 30, 2024 — Detroit, MI

As someone with an astigmatism I fear driving at night because it’s so blinding

B.3319 January 30, 2024 — Eugene, OR

These light re dangerous for pedestrians and other vehicles.

B.3320 January 30, 2024 — Gilbert, AZ

These lights are dangerous.

B.3321 January 30, 2024 — Midland, MI

I already have a difficult time with night vision, especially when headlights are coming toward me. The super bright headlights make it impossible to see anything, its very dangerous and completely unnecessary.

B.3322 January 30, 2024 — United States

There no reason you get to see everything when other drivers only get to see your headlights.

B.3323 January 31, 2024 — CLIFTON PARK, NY

Anyone who needs headlights so bright as to see a hair on a frogs ass 3 miles away DEFINITELY doesn't need to be on the road at night.

B.3324 January 31, 2024 — Northfield, VT

I agree

B.3325 January 31, 2024 — Wilton, CT

I get chronic migraines and because of that I am very sensitive to bright light. Modern LED headlights make driving at night a painful experience for me. The lights themselves hurt my eyes and seeing them over an extended period while driving is enough to trigger a migraine. If I'm in the car and not driving, I'm wearing sunglasses. I never used to have this problem with the old style halogen bulb lights, but these new bulbs have gone too far. They are causing me, and many others with my same and similar conditions, physical distress.

February 2024

B.3326 February 1, 2024 — Altadena, CA

High glare blue LED headlights blind drivers especially on dark roads. Night vision is blown as one comes around a curve into those glaring lights. Overly bright blue lights are a dangerous safety hazard. Too many years have passed without DOT or other agency action. Outlaw blue headlights ASAP!

B.3327 February 1, 2024 — Cedar Lake, IN

I am a retired guy who can no longer drive safely at night because of LED headlights coming at me.

B.3328 February 1, 2024 — Lexington, NC

LED headlights are danger to the road and hazardous. they're not needed and they're not appreciated

B.3329 February 1, 2024 — Queen Creek, AZ

I drive at night due to my work schedule. Oncoming lights are bad news

B.3330 February 1, 2024 — Toronto, Canada

I suffer to and from work each and every day. I see people blinding others at crosswalks and even near schools. I find it unbelievable that it is standard practice. School buses use high beams as well. Vehicles are using highbeams even before my night time running lights go on automatically. It is extremely dangerous for the safety of children. I hope you can make a difference. According to Academies of Opthamology, they are damaging to our eyes as well. The long term damage is unknown, but it is painful to the eye indicating the possibility of damage. Insurance companies should demonstrate interest in this issue, giving the rise of fatalities and aging drivers who have incurred concussions throughout their lives.

B.3331 February 2, 2024 — Bengaluru, India

It's a health hazard and safety hazard to not only human beings but all living beings

B.3332 February 2, 2024 — Birmingham, AL

I am a young woman and it has become so difficult to drive at night because of bright headlights. I even have a higher sitting car and it is still difficult, it has made driving at night anxiety inducing and something needs to change.

B.3333 February 2, 2024 — Bowie, MD

It's astounding that there's no regulation on brightness when these headlights literally put drivers in dangerous situations. I hate driving at night when it feels like everyone has their highbeams on and I can't see the road much less an animal, pedestrian, or cyclist in my vicinity. Will laser beams in headlights be ok too or will that finally cross the line?

B.3334 February 2, 2024 — Roswell, GA

Safety matters.

B.3335 February 2, 2024 — Sauk Rapids, United States

It's not fucking safe, Period.

B.3336 February 3, 2024 — Baraga, MI

My 36 yr old son Peter died in a car accident from L E D lights on wrong side of highway. He has 2 children. When is enough ? They should be recalled in every vehicle. I wont quit fighting till they are.

B.3337 February 3, 2024 — Camborne, ENG, United Kingdom

I want to be able to drive at night without being blinded by headlights. Either ban them or position them lower.

B.3338 February 3, 2024 — Frederick, MD

I try not to drive at night anymore because the overly bright headlights almost always bring on a migraine

B.3339 February 3, 2024 — New York, NY

It's a safety hazard. Those lights are blinding, causing me to momentarily be unable to see what's going on around me ,it's even worse in the fog, and in hazy rain, which is very common where I live.

B.3340 February 3, 2024 — Rochester, NY

I can't stand being blinded by an increasing number of headlights.

B.3341 February 4, 2024 — Austin, TX

The new headlights from multiple car brands and manufacturers actually angers me to a point where I am now an aggressive driver at night because I feel it is the only way I can be. It is RIDICULOUS to think these headlights are even necessary for the majority of the population who drive them in well-lit urban areas and large cities. There absolutely MUST be stricter regulations in place. The human eye is unable to filter and process blue/white lights. The recovery time to adjust sight back is too long; especially when operating a giant metal weapon.

B.3342 February 4, 2024 — Brunswick, OH

I'm tired of blinding lights and tailgating with said blinding lights trying to run me off the road. It's obnoxious and absolutely a danger to drivers. Nobody needs lights on their car bright enough to see into the future.

B.3343 February 4, 2024 — Chelsea, MA

I have given up driving at night because I am unable to see the road. I have asked multiple doctors about night blindness and have always been told it's the lights not my vision.

B.3344 February 4, 2024 — Minneapolis, MN

Some of these headlights are so bright that it causes me to see spots! This is not safe for driving. It even happens when the headlights are reflecting in my side and rear view mirror!

B.3345 February 4, 2024 — Newberg, OR

I'm scared for every time I drive at night, my drive home from work typically consists of 3 or more blinding moments by LED headlights. It's not safe. There so much else to worry about on the road, please take blinding lights (LED headlights) out of the mix.

B.3346 February 4, 2024 — Ramsgate, ENG, United Kingdom

These really are dangerous and I can only hope they get banned.

B.3347 February 4, 2024 — San Diego, CA

Instead of Banning Blinding headlights, why not try to raise awareness for blinding headlights and suggest tinting or nighttime worn glasses.

B.3348 February 4, 2024 — Seattle, WA

Ive almost killed a pedestrian . It is unbelievably dangerous and needs to be recalled , just like airbags or dangerous seatbelts!!

B.3349 February 4, 2024 — Woodbridge, VA

This an important petition. Headlights DO NOT need to be bright enough to light up a stadium for you to travel safely!

B.3350 February 5, 2024 — Dublin, OH

It is absolutely out of control in Ohio. So many accidents over this law enforcement and local governments just ignores the problem, I guess their body count must not have met its quota yet ! Do better

B.3351 February 5, 2024 — Edmonds, WA

the lights are just too bright, and it's unsafe for other drivers!!

B.3352 February 5, 2024 — Salt Lake City, UT

Driving with astigmatism has become even more challenging for me since the production of these headlights I genuinely fear for my safety and other when I'm driving. These headlights are a bad decision on all parts.

B.3353 February 5, 2024 — Sandpoint, ID

These lights are too bright for on coming traffic. I try to look away, at the right paint strip, but once you glance into these lights, it's spots for several seconds. I believe risk to other drivers outweighs benefits of being able to see into the next county. Thanks.

B.3354 February 5, 2024 — Springfield, OR

They hurt!!!!!!! It is truly painful! I should not have to stop night driving because some companies will not fix this mistake.

B.3355 February 5, 2024 — Sylva, NC

driving HWY 471 a 2 lane truck route the blinding LED lights in the rain is the worst the rain makes the fog line disappear and that is the only way you can stay in your lane with these bright lights is to focus on the fog line. There are many pickups with the lights elevated and they have 4 headlamps that make it nearly impossible to see the road. BTW there is no paved shoulder on this road you are in the grass at 60+mph these lights are going to lead to many fatal accidents if they are not banned/recalled

B.3356 February 5, 2024 — Westford, MA

I HATE those headlights. I can't tell you how often I'm blinded by them; it's like people are driving around with their brights on. And, that auto-dimming feature doesn't work well at all.

B.3357 February 7, 2024 — Bar Harbor, ME

High power white headlights are bad for road safety as they make it difficult for drivers on the opposite side to see the road. These headlights should be banned.

B.3358 February 7, 2024 — Chandler, AZ

the extra brightness of new lights may seem to be safer for the driver of that vehicle but is in fact more dangerous for all those around that vehicle. Safety inspections should be more important than emissions inspections with headlight alignment being a critical part of them. vehicle ride height should also be fined as lights are now above the rear windows of most cars. All unsafe and need to be controlled.

B.3359 February 7, 2024 — Dallas, TX
there doing it on purpose just like everything else to decrease the population...

B.3360 February 7, 2024 — Harrisburg, PA
LED lights are dangerous and strain drivers eyesight while in a vulnerable state in darkness to be "blinded" by bright lights from all directions.

B.3361 February 7, 2024 — San Diego, CA
LED halogen headlights are dangerously bright; exceeding even brights of many cars.

B.3362 February 7, 2024 — Springtown, TX
Headlights are way too bright for on coming vehicles to clearly see the road in front of them. There is no reason normal headlights need to be so extremely bright that other drivers are literally blinded. Vehicles also do not need to have an abundance of lights on the vehicle also blinding other drivers. Drivers managed roads just fine when vehicles only had 1 set of lights in the front for ages.

B.3363 February 8, 2024 — Derby, ENG, United Kingdom
I am regularly blinded by new Xeon headlights. They are dangerous

B.3364 February 8, 2024 — Dorking, United Kingdom
I am always being blinded by headlights that are too bright.

B.3365 February 8, 2024 — Doune, SCT, United Kingdom
Some headlights are so dazzling that they are a danger to all motorists. It's particularly bad when the oncoming vehicle is a SUV and also when it's raining. I have been driving behind vehicles where the driver has slowed to a really low speed because the driver is dazzled by headlights. This can be a secondary risk outcome of such bright oncoming headlights.

B.3366 February 8, 2024 — Exeter, ENG, United Kingdom
I find it very difficult to see the road when I am being blinded by oncoming traffic and sometimes traffic behind me, I have to avoid looking in my mirrors and checking behind me like I normally would for that reason.

B.3367 February 8, 2024 — Fareham, ENG, United Kingdom
These lights are dangerous

B.3368 February 8, 2024 — Hognaston, ENG, United Kingdom
I have been dazzled so many times by these grossly inappropriate and unnecessary headlights that I frequently fear driving at night. They are the product of arrant stupidity on behalf of car designers who have limited understanding of what they are doing.

B.3369 February 8, 2024 — Ipswich, ENG, United Kingdom
I'm often blinded by oncoming headlights I'm 66 and I know my eyes are not perfect, but this is a real problem for me.

B.3370 February 8, 2024 — King's Coughton, ENG, United Kingdom
Bright headlights are an increasing danger on our roads.

B.3371 February 8, 2024 — Lincolnshire, ENG, United Kingdom
LED headlights are not cleanly focused downwards hence glare to oncoming drivers even when "dipped". Also LED light colour is cold-white, whilst incandescent are warm-white, hence less glare.

B.3372 February 8, 2024 — London, ENG, United Kingdom
I'm only 60 and already struggling to drive after dark safely due to the glare from LED headlights and high vehicles

B.3373 February 8, 2024 — Pill, ENG, United Kingdom
As I get older I'm finding it much harder to drive at night, despite having good eyesight and being an experienced driver. Some car headlights are simply dangerous.

B.3374 February 8, 2024 — Sheffield, ENG, United Kingdom
These excessively bright LED lights are stopping me going out in the evening. They are almost blinding.

B.3375 February 8, 2024 — Southampton, ENG, United Kingdom
Headlights are way too bright now

B.3376 February 8, 2024 — Sunderland, United Kingdom
Headlights are too bright or badly adjusted.

B.3377 February 8, 2024 — Westbury, ENG, United Kingdom
Fed up being dazzled all the time,

B.3378 February 8, 2024 — Weston by Welland, Mkt Harborough, ENG, United Kingdom
Some of these Led lights are dangerous. Everything around them appears black and I have to slow down - sometimes to almost a stop in order to feel safe.

B.3379 February 9, 2024 — Baraga, MI
Our son was killed in a car crash because of these blinding lights, a man parked his F-250 on the side of the road towards oncoming traffic to get his mail, he had these bright led lights pointing towards my sons vehicle, my son swerved thinking it was it was a passing vehicle, hit the ditch, rolled a couple times breaking his neck in 2places

B.3380 February 9, 2024 — Baraga, MI
These lights are a hazard for all oncoming traffic at night, if you do not look for the whiteline to the right of the road you do not know where you are while driving

B.3381 February 9, 2024 — Belfast, NIR, United Kingdom
Driving in the dark has become extremely dangerous. Risk like this would not be allowed in any work place never mind driving a killing machine around a bend or over a hill and just hoping for the best! Should be banned immediately.

B.3382 February 9, 2024 — Bexhill, ENG, United Kingdom
I find it increasingly difficult to drive at night because of glaring headlights

B.3383 February 9, 2024 — Bexleyheath, ENG, United Kingdom
Blinding lights are dangerous

B.3384 February 9, 2024 — Bristol, ENG, United Kingdom
I rarely drive at night now as find the lights too dazzling

B.3385 February 9, 2024 — Burston, ENG, United Kingdom
It is very dangerous to be blinded by incoming headlights - and scary as well!

B.3386 February 9, 2024 — Camberley, ENG, United Kingdom
I'm fed up with being blinded by headlights in my rear view mirrors.

B.3387 February 9, 2024 — City of Westminster, United Kingdom
Blinding and very dangerous, shocking that these lights have been allow on the road.

B.3388 February 9, 2024 — Coulston, ENG, United Kingdom
I find modern headlights too bright, sometimes blinding!

B.3389 February 9, 2024 — Crickhowell, United Kingdom
If nobody has lost their life because of these dangerous headlights yet, it's only a matter of time.

B.3390 February 9, 2024 — Dagenham, United Kingdom
These new headlights are really dangerous and need changing

B.3391 February 9, 2024 — Farnham, United Kingdom
They are dangerous as blind on coming drivers.

B.3392 February 9, 2024 — Ferring, ENG, United Kingdom
I am an older driver and find that many car headlights are dazzling, making driving more dangerous at night. For that reason I try to avoid driving at night.

B.3393 February 9, 2024 — Hatfield, ENG, United Kingdom
Veronica ouchabane

B.3394 February 9, 2024 — Loughborough, ENG, United Kingdom
I've always been against these car LED lights because of glare. Hope something gets done to ban them.

B.3395 February 9, 2024 — Lynnfield, MA
Sick of being blinded

B.3396 February 9, 2024 — Mill Hill, United Kingdom
The lights are blinding as if people have full beam on

B.3397 February 9, 2024 — Milton Keynes, United Kingdom
Driving at night is becoming increasingly difficult due to being dazzled by oncoming vehicles

B.3398 February 9, 2024 — Newport, ENG, United Kingdom
Living in the countryside with no street lights the brightness of car lights has stopped me going out in the evening as they blind me

B.3399 February 9, 2024 — Northwood, United Kingdom
The lights are dangerous in my opinion

B.3400 February 9, 2024 — Norwich, ENG, United Kingdom
Headlights are intensely bright, with an almost blue colour. I avoid driving long distance at night because of safety concerns.

B.3401 February 9, 2024 — Oak Lawn, IL
These newer bright headlights are THE worse aspect of newer cars. They temporarily blind you ! Please stop their use. Aggressive drivers use the brights on purpose!!

B.3402 February 9, 2024 — Rochdale, ENG, United Kingdom
Manufacturing needs to be addressed this is dangerous and killing people

B.3403 February 9, 2024 — Swindon, ENG, United Kingdom
I am being blinded by headlights it has become a real problem driving at night in the last few years. I don't feel safe.

B.3404 February 9, 2024 — West Horndon, ENG, United Kingdom
Modern headlights are far too bright. It's alright for those behind the wheel, but for those facing the lights it's far too dangerous. It's an unnecessary hazard that's putting lives at risk. Modern drivers are so used to driving motors fitted with such dangerous lights that they just won't be able to cope if there's another war and we have to restrict our lights.

B.3405 February 9, 2024 — Westminster, United Kingdom
This is a real problem on country roads

B.3406 February 9, 2024 — london, ENG, United Kingdom
The lights are blinding and dangerous

B.3407 February 9, 2024 — wakefield, ENG, United Kingdom
New bright LEDs are worse than old high beams

B.3408 February 10, 2024 — Brighton, United Kingdom
LED lights can be dangerous - and blinding to many Drivers

B.3409 February 10, 2024 — Cape Town, WC, South Africa
the lights are blinding & disconcerting!

B.3410 February 10, 2024 — Dagenham, United Kingdom
I am affected by LED lights. I see colours, makes my eyes burn and I get dizzy from them

B.3411 February 10, 2024 — Donna, TX
Janet Grano

B.3412 February 10, 2024 — Dunmurry, NIR, United Kingdom
New LED car lights are blinding, making driving extremely risky, especially on minor and country roads

B.3413 February 10, 2024 — Durban, South Africa
What happened to the yellow light, which is much better.

B.3414 February 10, 2024 — Forest Grove, OR
These lights give me migraines, and I am not talking about a mere headache. I mean full on nausea, vertigo, brain fog, fatigue, a horrid stabbing pain in my eye, all of it. An attack can last for days. For many migraine sufferers, LEDs are bad for our health, and we have just as much a right to go out at night as anyone.

B.3415 February 10, 2024 — Gourock, SCT, United Kingdom
Over-bright headlights lights are unnecessary and a genuine safety hazard.

B.3416 February 10, 2024 — Greenock, SCT, United Kingdom
I absolutely think they will cause accidents and the brightness of them induces me to have a migraine where I get an aura at the corner of my vision .

B.3417 February 10, 2024 — Liskeard, ENG, United Kingdom
They′re outright dangerous & should be banned.

B.3418 February 10, 2024 — London, ENG, United Kingdom
It’s blinding

B.3419 February 10, 2024 — PONTEFRACT, ENG, United Kingdom
It is dangerous to other road users

B.3420 February 10, 2024 — Petersfield, ENG, United Kingdom
LEDs are bad for our eyes!

B.3421 February 10, 2024 — Petworth, ENG, United Kingdom
They are a danger to drivers

B.3422 February 10, 2024 — Petworth, UK, ENG, United Kingdom
Terribly difficult to drive when you are blinded by strong headlights of an approaching car

B.3423 February 10, 2024 — Snohomish, WA
They are seriously a cause for fatalities that could be prevented.

B.3424 February 10, 2024 — Summit, NJ
It is getting increasingly difficult to drive safely at night. I am constantly being blinded by the ultra bright lights of oncoming traffic. There needs to be legislation to limit the intensity of headlights.

B.3425 February 10, 2024 — Swadlincote, ENG, United Kingdom
Glaring headlights, side lights, hazard and bicycle lights are dangerous.

B.3426 February 10, 2024 — United Kingdom

Living in a rural location, I have to drive home from work in middle of road to avoid numerous potholes on side of country roads and I literally have to stop if another car comes towards me with their oncoming blinding headlights with fear if I don't, I face a puncture from a pothole .....I can't win either way!

B.3427 February 10, 2024 — witley, ENG, United Kingdom

I have really struggled driving in the dark because of these lights!

B.3428 February 11, 2024 — Austin, TX

These excessively bright lights are a danger to all road users, especially cyclists and pedestrians.

B.3429 February 11, 2024 — Beckenham, ENG, United Kingdom

I want to stay safe on the road.

B.3430 February 11, 2024 — Canmore, AB, Canada

I can no longer drive at night because of these lights. It's a problem for many people.

B.3431 February 11, 2024 — East Brunswick, NJ

I can't see at night when I drive and it's very dangerous!

B.3432 February 11, 2024 — El Cerrito, CA

This new crop of bright headlights are seriously too bright for me at night. I struggle every time I need to change lanes on highways and multi-lane streets because I cannot avert my eyes or ignore the bright lights in my side or rearview mirror. What used to be an occasional annoyance is now becoming a more substantial threat to my safety (and everyone who shares the road with me).. they're even brighter than my high beams! They also pose a safety threat for pedestrians, especially the elderly and visually impaired who are light sensitive.

B.3433 February 11, 2024 — Hitchin, ENG, United Kingdom

I'm constantly being blinded by these over-bright headlights.

B.3434 February 11, 2024 — Lowestoft, ENG, United Kingdom

Making driving in the dark more dangerous

B.3435 February 11, 2024 — Midvale, UT

They are dangerous. Something that impairs other drivers has no business being on our roads.

B.3436 February 11, 2024 — Miners Rest, Australia

There's no recognition of the dangers of driving light that are to bright, both at night and also during the day, for cars trucks and motorbikes, due to government stupidly encouraging daytime use of head lights and daytime running lights (a marvellous safety innovation) that are too bright. The inept policy of wired on motorcycle headlight causes multiple deaths due to other road users not being able to judge motorcycle speed and acceleration.

B.3437 February 11, 2024 — New Bern, NC

I drive a semi truck, and the new headlights, especially on the pick up trucks, are insane. They are as bright as brights. I have a large manilla envelope I hold up to block the lights in the side view mirror. I have to slow down when lines of cars are in the on-coming lane because I can't see anything in my lane. My eyesight is 20/20. It's not safe for these vehicles to have such bright lights, and am 100% opposed to them.

B.3438 February 11, 2024 — Oakhanger Crewe, ENG, United Kingdom

These headlights are dangerous, the glare reduces the ability of oncoming drivers

B.3439 February 11, 2024 — Sammamish, WA

Seeing is important while driving. It's common sense.

B.3440 February 11, 2024 — San Antonio, TX
I'd like to be able to see.

B.3441 February 11, 2024 — Sheerness kent, ENG, United Kingdom
I really am blinded by the lights

B.3442 February 11, 2024 — United Kingdom
Constantly being blinded by on coming traffic or from cars behind me. Wuth LED lights. Ita a disgrace. Accidents waiting to happen. Government must do something about this

B.3443 February 12, 2024 — Chessington, ENG, United Kingdom
Night time driving has become a nightmare for me due to blinding, misaligned and confusing lights.

B.3444 February 12, 2024 — Cordova, AK
Industry needs safety supervision for the protection of all of us.

B.3445 February 12, 2024 — Fort Bragg, CA
Led headlights are too bright

B.3446 February 12, 2024 — Mendocino, CA
The amount of light that is produced from headlights is absolutely blinding and makes me feel like I'm going to crash all of the time. There is nobody who needs that much light in order to drive well. However, we do need less light in order to drive well and be safe. Light pollution is an underappreciated problem. This is why I'm signing this petition.

B.3447 February 12, 2024 — Norwich, United Kingdom
LED lights are dangerous to all on the road. How did these lights pass the standard...

B.3448 February 12, 2024 — Pulborough, ENG, United Kingdom
Reducing risk on the roads is important

B.3449 February 12, 2024 — San Diego, CA
Marcia Lowrey

B.3450 February 12, 2024 — West Sussex, ENG, United Kingdom
LED headlights are blinding

B.3451 February 13, 2024 — Benicia, CA
Headlights as well as red break lights as well! When I'm at a red light I feel I could melt, due to the intensity of those red break lights!

B.3452 February 13, 2024 — providence, RI
I will literally no longer be able to drive at night because of this I'm only 48 years old. These lights literally blind me and I'm afraid I'm going to crash.

B.3453 February 14, 2024 — Abergavenny, WLS, United Kingdom
I have experienced dazzle both from headlights and over bright tail lights. There is light pollution of all sorts damaging peoples eyesight and it should be addressed v

B.3454 February 14, 2024 — Kent, ENG, United Kingdom
I hate the glare at night it blinds me

B.3455 February 14, 2024 — Latham, NY
The extra bright lights blind on coming vehicles and can result to an accident, or striking a person walking along the roadway because of the bright lights. Bright lights can kill people and pets. RECALL BRIGHT LIGHTS

B.3456 February 14, 2024 — London, ENG, United Kingdom

This is a real problem, the lights are far to bright and makes it dangerous when dazzled by bright lights!

B.3457 February 14, 2024 — San Francisco, CA

I've almost gotten into a number of accidents and almost hit someone because of being blinded by ridiculously bright oncoming headlights. Bright headlights are obviously needed but not to the point where they impact other people's ability to drive safely. They are a nuisance that jeopardize people's lives. It's a no brainer that they should be made illegal.

B.3458 February 14, 2024 — Sherwood, AR

I FUCKING HATE LED HEADLIGHTS

B.3459 February 14, 2024 — Spring Hill, FL
